Editorial
Integral Foundations

Introducing the First Issue of *Integral Review (IR)*

We are proud to offer the first issue of *Integral Review (IR)*, a new journal to publish works on qualitative change and development in different spheres of life, under an integral perspective. "Integral" stands for a worldview, paradigm, epistemology or general approach that encompasses multiple perspectives and dimensions, holism, and integration. Efforts to take integral approaches are finding their way into many avenues of academic and professional discussion as well as into practical application in a variety of fields. It is our intention to make a significant contribution to the discussion and research in this area through publication of articles which have been thoroughly discussed and reviewed by the editorial committee as well as by external reviewers. Articles will be either openly peer reviewed or will go through a blind review process, according to the authors' wishes.

"We" stands for a group of people who have joined together for this common endeavor after several years of internet exchange and discussion. Other than a few individual personal meetings, it has been a virtual community, focused on discussing the integral approach. We came together at the initiative of Sara Ross, who founded ARINA Inc., which is IR's publisher, and formed an editorial committee as a subgroup of ARINA for publishing *IR*.

This journal is offered as an open-access, free publication. We are using a Creative Commons copyright licensing approach that permits copying and distribution of IR's contents when attribution to publisher and author is included, but does not permit commercial use of contents without the publisher's permission.

The articles in IR are in English or other languages. In the case of non-English texts there is a summary in English in addition to a traditional abstract in English.

From beginning to end, the production and release of this internet journal has been, and will continue to be, an honor to participate in. Our reward is the motivation and satisfaction that can be drawn from cooperating across continents, cultures and disciplines in a meaningful project. As well, we will find reward in the feedback, active engagement and the contributions of readers, and we have designed mechanisms to facilitate this.

The Afterword for this inaugural issue will take an experimental, interactive form. When readers click the Afterword link in the Table of Contents, they will arrive at a public log-in portal to one of ARINA's forums. There, readers will find an Afterword discussion space ready for discourse about this issue, issues it raises, etc. In addition to the Afterword, there are Author Roundtable forums for discussion of specific articles, and various authors will participate to varying degrees or at least "drop in" and visit.

On the Contents of Issue # 1

For this first issue of *IR* we decided to present (as much as possible) our own positions within the larger integral conversation by publishing texts representing our different approaches, personal backgrounds and professional fields. Additionally, we invited some other professionals to contribute to this issue. We aim to step back a little in succeeding issues to leave plenty of room

SOME RIGHTS RESERVED

for more authors from around the world.

In this first issue, we start with a lead article by the editorial committee of *IR* itself. In it, we attempt to present the essence of our understandings of “integral” and “integral paradigm.” According to the integral principle of balancing unity and diversity, Sara Ross, president of ARINA, and Reinhard Fuhr, editor-in-chief of *IR*, describe what we might call our first attempt to define a common denominator for understanding “integral” in the course of introducing readers to IR and its mission. Its mission is conveyed by discussing the meanings we give to the terms used in the journal’s entire title. This is then complemented by contributions from individual members of the editorial committee. These committee members point out their personal emphases and viewpoints of “integral” in the context of their personal histories and respective professional fields, in agreement with or deviance from the main body of the article.

Jean Gebser may be considered as the intellectual father of integral thought and discussion. In a very concentrated form, Kai Hellbusch, a Gebser expert from Germany, presents the main assumptions of this extraordinary scholar by explaining “consciousness structures” as the very basis of all experience, perception and thinking. Hellbusch then summarizes the main characteristics of Gebser's spectrum of worldviews, from archaic to magic to mythic to rational to integral.

In the next article, Jan Inglis and Margaret Steele, from Canada, develop and explore a concept they call *complexity intelligence.* They draw on a broad range of literature to support putting forward the term complexity intelligence as a requirement for the work of *cultural coaches.* These cultural coaches represent a new kind of change agent, whose major task is to facilitate bridging the gap between different developmental paradigms within social contexts.

Michael Basseches, of the USA, complements approaches to the integral discourse by describing it as a psychological phenomenon of intellectual development that he calls dialectical thinking. Its dialectical dynamic, summarized here from his previous research, is distinguished from uses of the term *dialectic* found in philosophical traditions. He offers a genuine philosophical approach to the psychology of integrated thinking, and transforms the meaning of dialectic into an organizing principle of such thought. He emphasizes its importance for our world in different domains of life, how it could be supported in different professional fields, and the limits of these endeavors.

Sara Ross, also from the USA, has summarized the findings of her many years of intensive research on the general characteristics of human dynamics. She offers a set of fundamental premises, illustrated and supported by a process model. She grounds these principles theoretically and in human experience, and from this succeeds in conveying general fractal patterns on a very high level of generalizability. These universal patterns and principles can then be used to understand developmental processes and inform integral methodologies in all areas of practice.

Anne Starr and Bill Torbert, USA, devote themselves to describing what they call “triple-loop awareness,” a human capacity that is potentially crucial for radical changes in terms of the integral paradigm. This concept has a few predecessors that are referred to, such as Bateson's “Level III Learning” or the “witnessing” consciousness in Eastern philosophies. The authors aim to go beyond merely talking about triple loop awareness by engaging readers in a way that aims to elicit such awareness. They involve readers by means of case studies, real life experience, and offer exercises in the course of reading itself.

Although we want to cope with the challenge of not dividing theory from praxis, personal background from subject matter, or the concrete from the general, we do have to emphasize one or the other in the articles. The following articles then put the more concrete, practical and/or personal issues into the foreground.

Thus Russ Volckman, USA, a consultant and trainer for leadership development, interviewed Thomas Jordan, from Sweden. Jordan has a long history of experience in research and praxis on workplace conflicts and as a consultant for conflict management and prevention. He has worked with personnel within the Swedish government, and reports in the interview on results from a recent research project: He wanted to identify integral qualities of mind and personality in people holding important positions in organizations. This investigation produced very interesting results for our understanding of the nature of integral consciousness.

Jonathan Reams, from Canada, approaches the challenging task of outlining the foundations for an integral leadership theory. His approach describes and then utilizes elements of integral theory to contextualize existing leadership theories, and makes distinctions about what sets an integral approach to leadership apart.

How can integral perspectives and approaches be applied in praxis? This is shown by Reinhard Fuhr and Martina Fuhr, from Germany, in their article on an "Integral Gestalt-Approach to Therapy and Counseling." They merge the once revolutionary ideas and concepts of Gestalt therapy by F.S. and L. Perls and P. Goodman from the 1950's with further developments of this approach, and with the most recent concepts on personal and social development. They then demonstrate on the basis of their long-term experience what integral therapy and counseling may look like in praxis.

When reflecting on what we have assembled for this first issue, it looks like a solid and challenging bulk of material which may not always be easy to digest, but which hopefully answers a few questions about the quality and scope of our intentions, and of what we call the "integral paradigm." Many of the articles will simultaneously raise new questions, so that it looks as if we are confronted with a kind of hydra when dealing with integral thoughts and experience. But we are sure that this hydra will turn out to be a benevolent and exciting creature that will continuously challenge our efforts, creativity, and mutual support. Of course, we would love to involve as many readers as possible in this adventure.

Reinhard Fuhr

Integral Review and its Editors

Sara Ross, Reinhard Fuhr, Michel Bauwens,
Thomas Jordan, Jonathan Reams, and Russ Volckmann

Abstract: In this introduction to *Integral Review's* inaugural issue, we explain the meaning we give to the title of this electronic journal which is open-access, both refereed and peer-reviewed, and why that meaning is important for us in today's world. The draft of the basic article, which was intensely discussed among the members of the editorial committee, was written by Sara Ross and Reinhard Fuhr,[1] and following it, other members of the editorial committee added their personal emphases in reference to the integral paradigm as well as their (critical) evaluation of the premises made in the basic article. Thus Thomas Jordan offers a set of categories and criteria for integral qualities which turned out to be most important in practice and evaluation processes. Michel Bauwens makes distinctions about the multi-perspectival nature of the integral paradigm, points out ways to avoid four different kinds of reductionism, and highlights layers of awareness. Russ Volckman emphasizes the connection between the diversity of worldviews and methodologies, which allow us to also integrate recent developments in behavioral approaches in his professional field of organization and leadership development. Jonathan Reams emphasizes the new, transcendent quality of an integral approach that enables us to use different qualities of "reflection" flexibly and - as we have a meta-framework of human perceptions and values - to recognize everybody's truth and feel compassionate with it. We then close with a discussion of the relationship between *Integral Review* and the mission of its non-profit publisher, ARINA, Inc.

Key words: change agents, complexity, consciousness development, Gebser, integral, integration, paradigm, research, social change, transformation, Wilber.

An Approach to the Integral Paradigm and the Meaning of the Journal's Title

Sara Ross and Reinhard Fuhr

We have a lot we want to share with our inaugural readers in this space as we have charged ourselves with the task of conveying, in the clearest possible manner, what *Integral Review* (IR) is all about. To shine a brighter light on that, here and there we may briefly mention what it is not about. In other places, we introduce differences in the way we as individual editors interpret the terms that describe IR. The value in doing this transparently, here, is to model how IR can be a spacious-enough vehicle for our diverse processes of interpretation, which continue to change as we do. For the most part, however, we use this space to define the concepts used in the Journal's title. We expect IR will have relevant appeal across a broad readership of change agents around the world.

---

The Integral Paradigm

The Meaning We Give *Paradigm*

Integral Review represents an approach to the Integral Paradigm. We inherit the word *paradigm* from the Greek language, and a standard American dictionary[2] definition captures its simplicity: an example, a pattern, especially an outstandingly clear or typical example or archetype.

This simplicity can easily be clouded by forgetting that patterns and archetypes are not the concrete, tangible things we see or words we hear. We can only infer them. They are like our physical skeletons that shape our human form, but are not themselves visible to the eye. This means we have to infer the "patterns, examples or archetypes" from what we observe, by looking for the deeper structures.

In addition to this, ”paradigm” has also come to refer to a specific scientific school's or a discipline's philosophical and theoretical framework (ibid.). IR's approach is, however, not restricted to one special discipline or scientific school, it attempts to encompass many different disciplines and formulate meta-theoretical positions.

All these words to define *paradigm* are as revealing or unrevealing as looking at a shadow on the cave wall: we see some contours of reality but not reality itself. We make this attempt in order to invite you, the reader, to develop alertness to the paradigmatic patterns—particular approaches to reality—detectible across the broad range of subjects IR covers. As a whole, articles in IR will be highly diverse clothing under which, and through which, the integral paradigm can become evident. This is because the integral approach represents a philosophy, meta-theory and a general pattern with particular qualities that can show up in every subject, and we have an editorial commitment of our best efforts to assure that it does. At the same time, we are in an experiential learning process: we will learn how to pioneer an approach to the integral paradigm in journal form by doing it.

The Meanings We Give *Integral*

Jean Gebser

The reasons this effort is important to us lie in the meaning we have for *integral*. We inherit this concept from Jean Gebser, an unconventional philosopher, who was born in Germany and finally settled down in Switzerland after many years of travel. He spent about 20 years examining virtually every field of human endeavor to discern the qualities of integral perception (Gebser 1985), acknowledging the challenge representing it, because "... this worldview goes beyond our conceptualization." In our attempts to define the integral worldview we are confined by the limitations of our language reflecting layers from earlier worldviews that do not apply to the integral view.[3]

It is a challenge to describe a new and relatively rare worldview: its "birth-pangs" first came into evidence only a century ago (Keckeis, 1985, xx). Gebser built his concept of an integral paradigm (as we would say nowadays) on *structures of consciousness,* which determine the "lenses" through which we perceive reality right from the beginning. These structures of consciousness are related to and shape virtually every human experience including our ways of reasoning. According to Gebser, they emerge from the universal mind or primordial consciousness (*Ursprung*), and form patterned structures that we would now call holarchies (according to Arthur Koestler's term): one stage of patterns building on the other, and through each more developed stage all the previous stages shine through and are available. Thus Gebser identified the five stages: archaic, magic, mythic, mental and integral.

---

[2] Merriam-Webster's Collegiate Dictionary, 10th Ed.

[3] See also Kai Hellbusch's article in this issue.

The integral paradigm itself is characterized by Gebser mainly in that it allows us to reconnect to the primordial origin again, but in a conscious and differentiated way. The world is no longer an object, we can now gain an intimate relationship to the world, in particular as an integral perception is no longer restricted by a particular concept of time, of either-or dichotomies or of one perspective of reality only: it is holistic, multiperspectival and multidimensional.

We can see through the individual phenomena we perceive and discover the greater *gestalt*. This gestalt principle, which is also an essential concept of the theory of Gestalt therapy as it was founded by Frederick S. Perls, Laura Perls and Paul Goodman (Perls et al. 1951), says that we can understand the individual phenomena of life in their deeper meaning by grasping the whole gestalt. A gestalt is more and something else than the sum of the individual components that we can connect in linear progressions (see figure 1).[4] It is *becoming* a whole that integrates the different parts by intuiting their very essence. In order to perceive in this integral way it is important that we *experience* the phenomena concretely. And we can only experience them in the *here and now,* in real-time. This holistic way of perceiving and gaining knowledge is not possible without seeking within ourselves, too, in relation to our environmental field (Gebser 1985, 99, 141, 268). Thus we are able to see through the surfaces and discover the basic patterns, and thus to relate the world's external processes and behaviors with the internal worlds'.

These few remarks on a most unusual and unconventional thinker may already indicate what fascinating and yet difficult task lies ahead of us when we attempt to realize, implement and further develop these ideas in different fields of knowledge and practice – and also which kinds of resistance in ourselves and in others may be provoked by the integral way of thinking and experiencing.

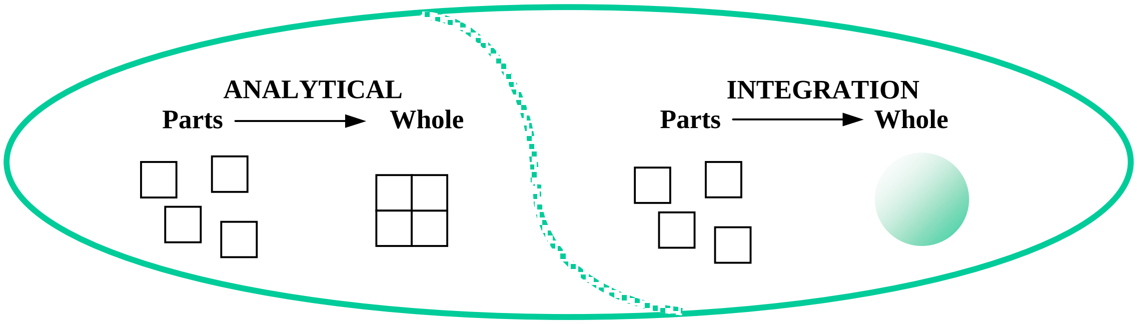

Figure 1: Analytical and holistic thinking

Ken Wilber and other Authors

Another approach to the integral paradigm – which is actually connected to Jean Gebser's theory – goes back to Ken Wilber. In spite of the fact that Wilber's work, widely spread in the world as it is, has been discussed very controversially, and in spite of the fact that he has been reduced to the leader of a new transpersonal or spiritual movement by quite a few "Wilber groups," many of us who are engaged in editing and/or writing for this journal owe a debt of gratitude, especially to his main work *Sex, Ecology and Spirituality* (1995) or *Integral Psychology* (2001). Even though we may disagree with, have to digest, and/or modify some of his propositions, he offers some rich and inspiring thoughts and ideas. Wilber attempted to synthesize many developmental theories from East and West in order to conceive of an encompassing meta-theory on evolution and development and the integral paradigm. Like Gebser, he considers development as an unfolding of Spirit and as a continuous spiral process within the individual, biological, cultural and social units, as well as organizations throughout their life cycles. And this developmental process may be seen and explored from at least four perspectives: an individual and a collective perspective, both in terms of an internal and an external view, resulting in the four major perspectives of one and the same reality.

---

[4] See also the German Handbook on Gestalt therapy (Fuhr, Gremmler-Fuhr, Sreckovic [eds.] or an English textbook (Woldt, Toman 2005 [eds.] 2005)

As this multiperspectivity opens new horizons for studying questions of personal and social significance in nearly all fields of life, practically and scientifically, we are also challenged to design and apply new research approaches and methods (connecting e.g. phenomenological and hermeneutic approaches with empirical studies and systems theory). There is no doubt, however, that the external perspectives strongly dominate in research, study, and praxis across the disciplines in our days. It will be a great challenge for those who form and contribute to IR to rebalance this lopsided view and if possible to *integrate* different perspectives when approaching professional fields. Probably there will be quite some controversial discussions on the scientific dignity of these different approaches. We may notice this, in particular, when we attempt to give the internal perspective (which concern human impulses and feelings, imaginations and beliefs or the cultural value systems, role taking and expectations in our societies) the same importance as the external approaches oriented towards empirical criteria only (see also Wilber 1998).

The evolutionary and developmental processes themselves have been explored in great depth by Ken Wilber and many other authors. These developmental processes can be studied in view of many different dimensions like emotions, reasoning, ethics, behavioral patterns, social competencies and structures, organizational and political structures, ways of living - to name but a few. All theses dimensions are considered to be aspects of the whole gestalt as explained before, and they are correlated with one another. It seems to be one of the greatest challenges in individual and cultural life, including of course those engaged in making this journal, to integrate all these different aspects of development.

According to Wilber and many other authors like Maslow, Selman, Erikson, Piaget, Kohlberg, Kegan, Loevinger, Cook-Greuter, and of course also Gebser himself (including many developmental theories from the East), the developmental processes do not form a lock-step march in a linear continuum within every person or society, but rather show some variety in when, if, and how they manifest. Regardless of individual variety, these stage patterns in different domains of life can be distinguished. As a result, we can notice different paradigms operating in the double meaning of the word as explained before: distinct methods of gaining knowledge of reality on the one hand, and basic philosophical and meta-theoretical assumptions on the other hand. These dynamics develop as holarchies, (mentioned briefly, earlier), i.e. they transcend and integrate their previous basic structures as they become more complex. Thus we arrive at a spectrum of development which can be reconstructed and studied from different perspectives of reality.

The co-founder of the Club of Rome and founder of the Club of Budapest, Ervin Laszlo, adds another perspective to this on a well-founded scientific basis. After lifelong research he comes to the conclusion that the world's civilization quickly moves towards a bifurcation in the course of a "macroshift" we are actually in (Laszlo 2003). Whether a critical amount and quality of transformational shifts to new paradigms (and in particular to a new worldview he describes and which we might call *integral*) in all fields of personal and public life can be initiated may, according to Laszlo, be an existential, though open question of survival in our global village.

One of the central topics in IR will at any rate be devoted to the further investigation of processes along the spectrum of development indicated above and to the possibility of supporting such transformational processes in research and praxis.

The Meaning of the Journal's Title

In this section, we want to explain what we mean word by word by the title of the journal: "Transdisciplinary and Transcultural Journal for New Thought, Research, and Praxis." This affords us a nice opportunity to ease into the more concrete language that characterizes the rest of this article.

"Integral"

Our perceptions of the world—our worldviews—are organic, whole-person dynamics that we operationalize in whatever ways we can to meet our purposes. As several of us editors discussed how to make the integral paradigm evident in the IR, and how to talk about it in this introduction, we surfaced multiple ways of *referring* to it.

One of us has particular appreciation for the simplicity of the dictionary definition of *integral*: essential to completeness; lacking nothing essential. This simple definition would refer to our hope that every IR article attempts to evidence the integral paradigm by covering its topic with the comprehensive depth, dimensional span, scales, and contexts necessary to convey its whole complex nature, to the extent possible in this medium. One of us would say the foregoing captures the meaning of "an integral approach," and another says we can avoid prescriptive problems if we use the notion of "integrally informed approaches."

We exchanged cautions that we need to beware of the natural human tendencies to make highly abstract concepts, such as "integral," into concrete "things." This can lead to confusing maps with the territories they point to. Yet it's helpful to model and experiment with new ideas in concrete ways: it is part of the process of integrating them as they make more and more sense to us through usage and peer review. Yet another editor wishes to avoid the perfectionism implied in the dictionary definition above, and prefers to stress the *intention* to be more complete, and the polarity of daring to take a clear perspective while also having the greater whole in view. He articulates a quality of *integral* that is implicit throughout this article, and deserves to be expressed. People find that integral approaches give them a completely new horizon of meaning making, defining a new existential sense of life by expanding the perceptions of connectedness; these approaches may make it much easier to make sense of our complex world.

Ultimately, all those words are meaningless if we don't get down to the practical matters of our real work in the world, and this is what we hope IR will be very much about. In that direction, IR has practical, integral criteria it applies to its work of journal production. Likewise, it has distilled from them the several general criteria we have agreed upon for works published in IR, as follows:

- They reflect or pay attention to the range of different worldviews and meaning-making processes that operate in people, and thus understand some of the processes and patterns that are evident in, and across, various phenomena.
- They demonstrate a sensibility for developmental dimensions and processes through-

out the human lifespan.

- They indicate some kind of orientation toward facilitating translative as well as transformative development in various domains of life. By translative, we mean enlarging the views, attitudes, and competencies of individuals, groups, communities, etc., within the level of their existing paradigms. By transformative, we mean catalyzing and supporting learning processes that facilitate the development of new paradigms and their qualitative capacities.

“Review”

“Review” in IR’s title means the active verb form of *review* because this publication is not a passive instrument that produces reviews of what is going on in the world. We treat it as an active verb because IR as a whole must attempt to fulfill the third criteria above in its own presentation. It, too, has the intention of fostering translative and transformative experiences by the way it engages its readers in both content and dialogue.

Review as an action includes all the familiar meanings of the term: to view, examine again, to look back on something with a retrospective gaze, to examine critically or deliberately, to evaluate, etc. These actions help us make sense of our experience—the process of our meaning-making—so that we can adapt to and learn from it. They help us notice unique features that we want to make sense of. And they help us detect patterns and common processes that may appear across differently clothed human experiences. The diverse actions included in the process of review are fundamental for people engaged in change efforts of all kinds, from the self and other individuals, to the organizational and institutional, to the general social and political domains. This is because we are not just *acting upon* others and our world; we are *interacting with* everyone and everything.

To facilitate active review processes for readers, authors, and editors alike, IR may include a feature not typically found in journals: an Afterword. This will be a place where we can offer reflective observations and sometimes questions about the issue contents and how they inform each other. It will be an opportunity to point to patterns and archetypes at play within and across articles. It will be a creative space for emergence of whatever inspirations we might have to foster our individual and collective reflection on the reading experience. It will be one structural mechanism within the IR to encourage dialogue within ourselves and among all of us. Perhaps it will lead to a Letters to the Editors feature where such dialogue may take place publicly.

The Afterword for this inaugural issue will take an experimental, interactive form. When readers click the Afterword link in the Table of Contents, they will arrive at a public log-in portal to one of ARINA’s forums. There, readers will find an Afterword discussion space ready for discourse about this issue, issues it raises, etc. In addition to the Afterword, there are Author Roundtable forums for discussion of specific articles, and various authors will participate to varying degrees or at least “drop in” and visit.

There are more meanings we give IR’s use of the action verb, review. The familiar meanings we listed above tend to orient us to looking at things “outside” ourselves. In the spirit of fostering concrete experiences to feed our integration processes, we always encourage the attention directed outward to flow back around to ourselves. This can remind us to examine how processes going on inside of our own skin are similar to processes going on “out there.” Without the essentials of self-reflection and reflexion, we would miss the prerequisite of integrating: *experiencing* our experiences in their very essence. Just reading about things in the abstract does not contribute to integration; the subjects we read about need to be engaged reflectively and reflexively, at minimum. Thus, *review* in this journal's title is an activity to engage.

We are aware that this wide-ranging discussion of our approach to the integral paradigm does not result in any crystal clear definitions, and may even invoke some frustration in a reader. Concrete experiences of frustration are natural responses to polarities we tend to experience when we want to understand something new and it does not fit neatly into familiar categories: they are natural catalysts for self-reflection, a way to re-view. The foregoing explication of the meanings we give the *Integral Review's* main title goes well beyond just our meanings and a title. We hope it gives you, as our reader, a concrete flavor of what the activity of an integral review can include.

"Transdisciplinary" and "Transcultural"

We deliberated long and hard about how much of a mouthful we wanted to allow IR's subtitle to become, and why. In the end, we decided each of its individual bites was necessary to augment the main title and convey our intentions for the nature of the Journal in a meaningful way. Predictably, we begin by defining what we mean by *trans*-. The first dimension of its meaning is traditional: across, beyond, and/or through. It can evoke images of humans' first transcontinental trading routes centuries ago, or railroads, or air flights. They crossed through geopolitical boundaries and spanned great distances across land, and above and beyond both those social and natural boundaries. The second dimension of *trans*- is that by its boundary- and scale-spanning nature, it changes how we customarily think about and do things. Its essential nature is transformative. Thus, we mean *trans*- in the dictionary sense of across, beyond, and through, so as to change. The next question is, change what?

First, as we begin to address that question, it will be useful to refer to Figure 1, where we illustrated a whole as "seen through" by an integral perception. A sphere like the one in this section's heading symbolizes it. In this discussion, the sphere can represent the whole problem or issue that needs to be addressed, for example, by a change agent. What is *changed* by a transdisciplinary approach is how we see the problem or issue, and where we stand in relation to it. A transdisciplinary approach is pragmatic, making the real world problem or issue the anchor that grounds efforts to address it. The problem or issue will be defined in terms of what it needs, regardless of geopolitical and institutional boundaries, and discipline, expertise, or biases of change agents or agencies, who will use and draw upon whatever resources, disciplines and knowledge bases are available and appropriate.

IR's transdisciplinarity is suggested by the range of articles' subjects covered in this inaugural issue. With the possible exception of any given special issue we may publish, every issue of IR will span multiple traditional categories and boundaries, to foster in all of us an integral perception of the wholes we are all trying to address as change agents.

The IR is intentionally transcultural in two ways. The first is most readily apparent, by its international editorial staff, its multi-language inclusion of articles, and its world-wide availability as an open-access electronic journal. We hope this quality will improve all our capacities to notice and work with difference arising within and from our cultural milieu. This does not refer only to group, national, and regional differences. IR's transcultural orientation may also illustrate that we often exist in a variety of cultural milieus, one at home, another at work, another at a place of faith-meeting, and another in our civic life. Developing a conscious awareness of the transcultural qualities in our own lives can inform how we notice and work with other kinds of cultural differences, *so that* we can surface new ways to work with them.

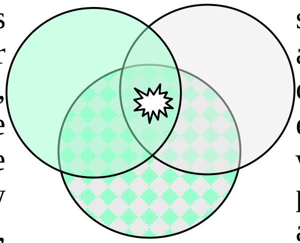
Sometimes this means we adopt more than one approach to accomplish an objective. That was our editorial decision as we considered the two different norms in use for producing peer-reviewed journals, as IR is. In Europe, a frequent custom is that the reviewers' and authors' identities are not anonymous to the other. In the U.S., the norm of academic journal publications is that the authors' identities are stripped from the manuscripts in a "blind" review process, in an effort to remove certain sources of bias on the part of reviewers, and the reviewers' identities are likewise anonymous to the authors. These two schemes are founded on very different assumptions, and IR has adopted the policy that it will accommodate both, based on author request.

At other times, there may be more challenging issues that require more creativity, adaptation, and a deliberate process to apply integral criteria. Such was another transcultural question we encountered as we prepared this issue of IR: What is an integral approach to the different cultural values placed on language that is variously called gender-neutral or inclusive? What is the integral approach when the very structures of some languages are inherently shaped around masculine- and feminine-gendered nouns (e.g., German and French). Several of us living in North America have lived through and been changed by the decades of inclusive language becoming the cultural norm, to the point of being broadly institutionalized in many contexts. In Western Europe, sensitivity about the use of inclusive language also exists, it has not been made a staunch cultural norm that pervades the spoken and written word everywhere and is therefore used more flexibly, especially given the constraints of some languages. How this question was resolved editorially will become evident to readers of IR in the course of reading it.

Secondly, IR is transcultural by its orientation to drawing attention to the individual and social patterns evident across cultures. Such attention is a resource for noticing and working with and within different cultures when it can discern the universal patterns that may be operating *beneath* apparent surface differences. This orientation echoes our earlier discussion of abstract patterns and paradigms. The ability to see and work with cultural difference is complemented by the ability to also see where there are additional human patterns operating in conjunction with them. This is a contribution often made by cross-cultural studies, and there are additional ways to study patterns that can significantly inform change agents' work. Both abilities are complemented by the pragmatic orientation discussed earlier, that of designing efforts that address the whole complex problem or issue as the anchor that grounds our work.

"New Thought, Research, and Praxis"

Rather than discuss our meanings for these terms—thought, research, and praxis—we will take a different approach in this section, and explain why. Integral Review is a transdisciplinary resource where all articles attempt to reflect to some degree the main criteria mentioned earlier. Those criteria apply whether authors share reflections on experience or discuss extensions, critique, or applications of a theory, report any kind of socially significant research, or describe practical methods to tackle a particular problem. To the extent that articles can approach the criteria, we expect that every article will be a contribution to new thought, new research, and new praxis. This is because integral approaches are yet rare in our world, and IR's mission is to encourage, solicit, and publish authors who take an integral approach to today's complex challenges.



We have inherited the three separate, abstract categories of thought, research, and praxis through the language of compartmentalized worldviews that developed them in times past. They are useful to employ in IR's subtitle for at least two reasons. First, they are familiar terms and in wide use, and thus they easily communicate the scope of the Journal's coverage. Equally important, they keep in the front of our attention the ongoing invitation to increasingly perceive, practice, experience, and write and read about them as the whole they can be through an integral perception. Rather than explicate this notion with another abstract discussion that has no integrative benefit, we make two open invitations to our readers. The first invitation is to engage in your own active, self-reflective inquiry into the meanings you assign each of these terms. Beneath those first-layer meanings, what assumptions are supporting them? How do you describe to yourself the nature of each concrete activity—thought, research, practice—and where you find their intersections? We invite you to test with your own lived experience our hypothesis that these are—at the level of their most basic essence—parts of a whole that is awaiting integration.

The second, equally open invitation is to write a short or long reflective story about how you tested this hypothesis we offer, and what you found out from your own experience, whether or not it happens to support our hypothesis. Share with all of us what you learned from the process, and how you think it might be useful—or has since been useful—in your approach to life and work. Whether in an issue of this Journal or on its publisher's website, we want to publish your personal research testing this proposal, and be able to report on a collection of such stories. It is one of the foundational research questions for an integral approach, and part of IR's mission is to publish socially significant research for the sake of the common good. We invite you into the co-creation of new thought, research, and praxis.

Defining "Integral"

Thomas Jordan

Four years ago I made a serious effort to define the meaning of "integral" in terms of a set of criteria that could be used to assess whether a perspective is integral or not. My point of departure was the field of integral politics and the need to describe the characteristics of an integral political perspective. I came up with nine items on a checklist. Some fellow "integralists," in particular Jim Turner and Sara Ross, offered constructive comments and alternative formulations of some of the items. The resulting product is ARINA's "integral evaluation process." I still feel it captures the essence of integral meaning-making, i.e. integral as a consciousness structure, rather than as the name of a particular kind of theoretical framework. So my contribution to a conversation on defining what we mean by the word "integral" is this checklist. I do hope the checklist will be a fruitful starting-point for an *integral* discussion about the meaning of "integral," rather than as a final statement.

The Integral Evaluation Process

1. Motivations

Do goals and aspirations reflect a mindset that is committed to the well being of "the whole," where even appropriately-focused specific interests and allegiances are always situated and pursued within a consciously overarching world centric frame?

2. Visions and Strategy

a. Is the strategy free from dualistic thinking in the sense of pitting an idealized vision of what ought to be, against a depreciating image of what is, in favor of a processual and integrative approach to learning, social change, etc.?

b. Does the perspective underlying the strategy view others as “objects” of the strategy's action, or does the strategy's design treat them consistently as the subjects of their own experience?

c. Does the strategy incorporate first-, second-, and third-person research and practice where possible?

3. Self-awareness

a. Is there a well-developed awareness of the nature of the perspective used in the process or task being undertaken, with awareness of the characteristics of this perspective in relation to other perspectives?

b. Is there evidence of non-attachment to one's own identifications with standpoints, i.e., an absence of defensiveness in relation to other views?

4. Identifications (self-embeddedness)

a. Is the meaning-making free from an adversarial stance, i.e., the tendency to regard other parties as the cause of significant problems who must therefore be defeated or brought under control?

b. Is there a fluid and open-ended relationship to identifications with collectives on the whole scale from one's own family, organization, faith community, professional practice or discipline, ethnicity, etc. to humanity as a whole, sentient beings in general, and the physical environment?

5. Interpretations of the world around us and in us

a. Does the worldview (the narrative describing the situation(s) of concern and causal relationships in its environment) reflect a profound awareness of the existence of complex systems, contexts, and causational layers and webs that influence the behavior of individuals and groups and explain the specific forms of events and conditions in society?

b. Does the worldview draw on an understanding of the limitations and dynamics of prevailing levels of development in the social systems and leadership that are related to the focus of concern?

c. Are proposals adapted to existing levels of development or meaning-making, so that any social processes or structures that are recommended will have good chances to function as intended, given where the people and culture are?

d. Is the perspective sensitive to the dialectic between (1) the need to create stable and well-adapted holding environments for existing meaning-making systems, so that these can be expressed in benign forms; and, on the other hand, (2) the facilitation of transformation to levels of meaning-making that are more competent in solving problems?

Beyond Perspectives, Reductionisms and Layers

Michael Bauwens

As indicated before, the concept of integral is an umbrella term that can encompass different interpretations, though I believe that they share a commonality: that they are multi-perspectival, i.e. aim to combine not just one worldview, but several, or is meta-paradigmatical, incorporating more than one just one paradigm. The term transdisciplinarity is also closely related: it is not only the juxtaposing of different disciplines in one research project, but an attempt to transcend the partial approaches into a unity, an attempt to go "beyond" the different disciplines.

As my own contribution, I would like to offer some more perspectives on the concept of integral.

The Place of the Integral Approach

Let's have a look at the first table:

	Parts	**Whole**	**Includes**
Difference	Postmodern approaches		Subjects and Objects
Similarity		Integral Approaches	Subjects and Objects
Similarity	Analytical Sciences	Systemic Sciences	Objects Only

This table is an attempt to show how the integral approach is related to other approaches. We can recognise two axes: one distinguishes attention for the 'whole' from attention to the 'parts;' the other distinguishes attention to similarities and 'structural unity' between different phenomena, from attention to difference.

All four approaches are valid in our attempt to understand 'reality.' The classic materialist approach is based on the reduction of any phenomena to its constituent parts, which are then studied separately. The idea of course is that such analysis is eventually followed by a synthesis, but the synthesis is always secondary, and for all practical purposes is often abandoned, since scientists have become hyper-specialised in their disciplines, and have difficulty understanding other specialised domains. It is still the mainstream approach in the hard sciences, and very important in the social sciences as well. The result is a fragmentation of our knowledge and worldviews.

Current emphasis on the whole gives us the systemic sciences such as cybernetics, the system sciences proper, self-organization theory, chaos and complexity theories. In such an approach, a part is only considered through its function for the whole. Furthermore, it is always objective, there is no attention for its separate subjectivity, intention, will, etc...

From the world of philosophy have come the postmodern approaches. These approaches stress that any worldview is dependent on perspective, that no part of a system can understand the whole. Therefore, it rejects 'grand narratives' for their hubris of taking an imagined godlike position of a part claiming to be able to know the whole. Postmodern approaches, also called post-structuralist, reject structuralist approaches, which look at structural unity, and like the systemic sciences, forget the subject. Postmodern approaches stress 'difference,' no 'thing,' no 'object,' no 'subject' exists apart from the field or system it is part of, and in fact, is defined by its difference from the other things in the same field.

The Integral approach can be seen as a reaction against the limitations and unforeseen effects of the previous methods. Unlike analytical science, it focuses on the whole. Unlike systemic approaches, it always includes the subjective component. Unlike postmodern approaches, it does not shy away from integrative 'grand narratives.' But it has also learned from the other approaches: that no attention to the whole can violate the truth of its parts, from the systemic sciences, that the whole is more than the sum of its parts, from the postmodern, that the integral is just another limited perspective, albeit a useful one. Integralism should therefore never be seen as a totalising, 'imperialistic' approach, but as another, integrative, multiperspectival way to look at the world. In fact, it can be said that any individual is an integrator, is a different composite, of his/her understanding of reality. But the specific effort, methodology, of the integral forces its practitioner to a more conscious effort to integrate as large a portion of truth as possible. Moreover, because it also knows the limitations of any individual perspective, it stresses that dialogic methods, involving intersubjective meeting of minds, can yield greater relative truth still.

Avoiding Reductionisms

Let us now look at the next table:

	Individual Aspects	**Collective Aspects**
Interior Aspects	Subjective field: The subject / the self	Intersubjective field: Spirituality / Worldviews
Exterior Aspects	Objective field: Technological artifacts as extensions of the body	Interobjective field: Natural Systems / Political, economic, organizational systems

As explained before, Ken Wilber has offered a synthesing way of looking at reality, by stressing the need to cover the following aspects of reality; subjective, intersubjective, objective, interobjective.

An advantage is its comprehensiveness. There are few other integrative approaches of such a large encompassing scope. Looking at any phenomena from those different angles is a very comprehensive way of looking at the world. It is also a tremendous way to avoid different kinds of reductionisms:

- The objective reductionism of the analytical sciences, reducing any whole to its material parts, in a permanent attempt to explain the more complex by the less complex, the immaterial by the material, the subjective by the objective. While such a reductionist and analytical approach yields tremendous value, it is also at the same time an impoverishment.
- The interobjective reductionism of the system sciences, which also do not integrate the subjective component, again reducing reality to its materiality, or rather to its 'functionality.'
- The subjective reductionism of any 'idealistic' approach that takes the human will, or divine will, as paramount, without sufficient attention to its grounding in intersubjective and interobjective systems and in materiality. More recently this tendency emerges as cognitive reductionism, where reality is reduced to the cognitive apparatus of the human.
- The intersubjective reductionism of some postmodern approaches, where everything is reduced to its constituent fields, for example language. In such an approach, materiality is often forgotten, everything becomes a 'discourse.'

Recognizing Layers

This is an interpretation of the integrative that resonates particularly in the context of my personal evolution.

Humans are layered persons. We have an instinctual apparatus and corresponding reactions, we have an emotional apparatus, a mental apparatus, a transmental ‘witnessing’ apparatus, at the very least. But because of our civilisational evolution, these different layers are far from well integrated. There has been a lot of unconscious ‘repression’ of our earlier layers, especially by mental layer, resulting in many individual and collective pathologies. As I see it, every human being should at some point in life, undertake a ‘regression in the service of the ego,’ i.e. make a voyage of discovery into the repressed aspects, undertake a ‘dark night of the soul.’ An important aspect of the integral approach is its developmental aspect, a focus on the fact that humans, societies, systems, evolve from the simple to the complex, from one historical formation to another. By uncovering this development, making the unconscious conscious, we become more whole, more integrated. Thus an integral approach obtains a ‘transparency’ in terms of our functioning, an ability to recognize ‘where we are coming from,’ not only historically, but ‘here and now:’ which layer is active, and ‘is it appropriate.’ In our particular civilisation this means a growing capacity to grasp reality as ‘a whole,’ and understanding how our different layers operate simultaneously. We can go beyond the ‘cognicentrism’ that is our common cultural lot. This is how I interpret Thomas Jordan’s contribution as well: through our own comprehension of our perspective, we can better understand other perspectives, and thus achieve a growing meta-perspectivity.

Conclusion: The Integral defined

To conclude, in my understanding, an integral approach is one that;

- respects the relative autonomy of the different fields, and looks for field specific laws,
- affirms that new levels of complexity cause the emergence of new properties and thus rejects reductionisms that try to explain the highly complex from the less complex,
- tries to formulate level-specific laws that relate the objective and subjective aspects, refusing to see any one aspect as a mere epiphenomena of the other,
- is subjective-objective in that it always relates the understanding of the objective, through the prism of a recognised individual perspective in general,
- and attempts to correlate explanations emanating from the various fields, in order to arrive at an integrative understanding; in this sense it is a hermeneutic discipline focusing on creating meaning.

Diversity in Worldviews and Methodologies

Russ Volckman

I would like to elaborate a bit on the notion of paradigm and its implication for my own interest(s) in presenting within these pages, as well as working with others whose contributions will surely enrich our explorations. Paradigm may be identified as a worldview of a particular school of thought. It has also been suggested to imply a methodology associated with that worldview.

This link between worldview and methodology is key to linking thought, research and praxis.

The behavioral school that dominated academic psychology and other social sciences in the 1960s and 1970s held a particular worldview that we can only study what we can measure. This led to the use of methodologies that provided opportunities for measurement, including experimentation with animals, laboratory experiments with human subjects, and the use of tools such as games, electronic devices and self-assessment instruments.

In academia this gave way to postmodernism and the relativism of its extreme expression, a topic amply discussed by Ken Wilber. There can be little doubt that an integral perspective is one that intends to draw on the validity of postmodernism and other philosophies and perspectives while leaving behind those elements that can be transcended and not included. And, while the term integral can be interpreted in a variety of ways, I assume it to mean a theoretical approach that seeks to examine what can be observed and what cannot, what can be measured and what cannot. Further, it is an approach that is concerned with development. My familiarity with it is based on reading the work of Ken Wilber and those who have built on his contributions.

Personally, as a graduate student and, later, faculty member in universities I found myself resisting and even reacting against behavioral approaches. I focused my energy on personal awareness and change through various humanistic psychologies, including gestalt therapy, body therapies and various other workshops and training. I demeaned the behaviorists and ignored their work — until I began looking at and working with organizations, teams and leaders.

In learning to become a change agent in the field of organization development I found that there had been a robust use of behavioral approaches to understanding change in organizational systems. The leading journal in the field was even titled, *The Journal of Applied Behavioral Sciences*. This journal continues to be published in association with the National Training Laboratories, an historic leader in the development of organization development practitioners (in Arlington, Virginia, and Bethel, Maine, USA) and describes itself as follows:

> With diverse audiences in mind, *The Journal of Applied Behavioral Science* publishes a variety of material designed to help individuals and organizations promote positive, successful change. The specific goals of the journal are to
>
> - Present a range of conceptual frameworks that explain, predict, and illuminate the implications of action
> - Describe social inventions, intervention techniques, consultation activities, emergent innovations, and educational practices
> - Employ the full range of social science
> - Examine underlying values, assumptions, biases, and beliefs associated with various forms of change…
>
> The Journal of Applied Behavioral Science's articles keep up with the evolution of the field, ensuring that you'll receive the best and latest analysis on the spectrum of social change. (http://www.sagepub.com/journal.aspx?pid=217)

This statement is a far cry from what I thought about narrowness of the behavioral sciences forty years ago. I am struck by the similarities in missions of that—and probably other—journals that are equally interested in the marriage of theory and methodology. What JABS and IR have in common is commitment to the discovery of approaches that both broaden and deepen our understanding of the dynamics of change in human systems. How they may differ is in the hypothesis that there is an approach, which can integrate diverse worldviews and methodologies.

Organization Development and related fields continue to hold as important that which can be measured. The field (theory and practice) has focused on what can be directly observed. Nevertheless, organization development practitioners have had a long interest in that which cannot be measured. I am reminded of Bob Tannenbaum's presentation at the 1982 OD Network Conference in reference to consultants' reliance on tools: "The most important tool you bring is yourself." In this sense, organization development has been a leader in looking at multi-disciplinary approaches to organizational and individual development and change.

It is from this field that we find concepts and methods related to culture and spirit at work. Practitioners have long sought methodologies that promote awareness and learning, working with diversity, promoting ethics and the capacity of organizations to create cultures in which individuals could be whole, healthy, creative and capable human beings while being productive and engaging actively with change. As such, it has been a field of study and practice that has reached out to many fields for inspiration and guidance: psychology, sociology, political science, anthropology, history, philosophy, ethics, biology, ecology, physics, mathematics, art, music and theater. Consequently, it is likely that an integral perspective will be embraced by this eclectic field of study and practice and that there is evidence that it already is by some.

I do not anticipate that Integral Review will become or be seen by others as just another journal about change. I believe we are challenged and committed to making the Integral Review relevant to theory and practice and to the world in the way described in this article. As such we will need to be able to address an audience and fellow explorers who have not only cultural diversity and diversity of world view, but diversity of capacity to engage with and learn from what we present. This is an extraordinary challenge of relevance and I suspect this will be a significant element of our own learning curve.

It is with this spirit of inquiry, openness and exploration in practice that the Integral Review offers a focus on change in human systems and for each of us as individuals. It is with this commitment to inquiry and discovery on every level of our endeavors that we provide opportunities to focus on development and change from an integrally informed perspective, as my friend and colleague Jonathan Reams likes to say. My own interests are on the application of this approach to the field of leadership studies. We have a wonderful opportunity to discover and demonstrate the relatedness of integrated, that is integral, approaches to change and development in how we understand what it is to be a leader and in how leadership emerges in human systems. To include ourselves as whole beings, with our own worldviews, behaviors that emerge in the context of how we hold cultural values and engage with systems provides us with an opportunity for a gestalt that will emerge no matter what our particular focus. That challenge is as much for me as it is to the readers and other writers of this journal. It is exciting to be part of this.

Transcendence and Compassion

Jonathan Reams

In reading over the introductory text of this article, I was struck by one passage that captured the heart of my interest in the so-called "integral paradigm." In discussing Jean Gebser's opening of the field, he is quoted as characterizing the difficulties in representing integral by saying that "this worldview goes *beyond our conceptualization*." I wrote my dissertation on the *Consciousness of Transpersonal Leadership*, and in it I explored the limits of rational analytical thought. Being exposed to a hermeneutical view of understanding, which recognizes the inherently reflex like action of thought as it reflects on lived experience, I came to see rational analytical thinking as a secondary process rather than a generative one. Thus the process of conceptualizing as a form of analytical thinking is inherently removed from, or less than the integral world view Gebser points to.

For me, this implies that the integral way of looking at things is generated from a level of consciousness, or paradigm beyond those elements which it aims to integrate. This is important, as trying to integrate conceptual frameworks with a meta-framework in the way integral theory does cannot be done with the same conceptual process. This notion comes from many sources basically stating that in order to change, comprehend fully, or make meaning out of something, one needs to engage this process from a level qualitatively beyond that of the object of attention.

So my understanding of the value of the integral paradigm emerges from this view of its central operating premise pointed to by Gebser. How that value is expressed or utilized by proponents of the integral paradigm varies, but from what I have read about it, I have found it to be the most comprehensive way of integrating all strands of inquiry. At the same time, I have also experienced that its complexity and sophistication lend to its being misunderstood, misrepresented, and reduced to that which the user can grasp. This is the proverbial not seeing the forest for the trees, and seems to me to stem from moving away from the core of integral beyond conceptualization into trying to ground integral in the concepts that arise from it.

It is in this sense that I resonate with the “trans” in the subtitle of the journal. I tend towards the connotation of trans that fits with “meta,” as in a meta-framework, or a meta-conceptualization. This is the transcendent aspect, that for me is the ground, the starting place of the unmediated immediacy of our lived experience. Out of this source we can generate conceptualizations, as we utilize rational analysis to reflect on this experience. The mindfulness an integral approach points to is to keep our attention from being trapped within the confines of the models or images these conceptualizations create, and then mistaking them for the thing they represent.

Thus the notion of being “integrally informed” appeals to me in this way. I recognize that my grasp of integral theory in all its glory is limited - both inherently in that it is beyond conceptualization, and in a more pragmatic way that it is not the sole focus of my life’s work. So I like to see that what I do and how I think is informed by this integral paradigm rather than that I have somehow grasped it and can design integral interventions and such. This is not to say that these things are not possible, and it is my hope that this journal will provide a vehicle for engaging in a common discourse to explore how people are applying this paradigm in their activities in the world. It is just for me to recognize that this view is still very much new and emerging, and in a state of open flux and experimentation to find out how to make use of it in practical ways.

One practical way this has shown up in my life was triggered by distinctions we can make between reflection, self-reflection, and reflexion. The layers of taking something experienced as implicit, tacit, or the self as subject, and using these methods to allow perception, assumptions and image/world view to be make explicit, or an object of awareness, has been an important and valuable process in my life. It has enabled me to move the ground of my actions in the world. I would say that I began (in my adult life) acting from a non-reflective place where my actions emerged primarily as an automatic reflex, conditioned by factors such as upbringing, culture, education and even genetics. Gradually, I was able to reflect on the external conditions of my life in a way that brought about a desire for change. This led to self-reflection and eventually having action and choice emerge from examining the links between attitudes and their effect on the way the world showed up for me. Later on, I began to be more grounded in reflexion, in an ongoing witnessing, experimenting, and inquiry about how I can make better choices about utilizing this dynamic.

What that has led me to is how I experience the integral paradigm. I experience it as a heart of compassion. This compassion shows up for me in the ability to see that everyone is living some truth. Having a ground beyond the inherently limited conceptualizations of these truths enables me to see past my own projections about those truths. Having a meta-framework allows me to see the context within which that truth has validity, and its limitations or boundaries. These things enable my rational analytical processes to act in service of this heart of compassion. It is my aim to have this journal serve as a vehicle for the ongoing unfoldment of collective capacity to operate in the world from this heart of compassion.

Conclusion

We have now reached the end of this present explication of our meanings, not only of the journal's title, but also this article's. Through each article herein, this inaugural issue, itself, is a further explication of meanings we have shared; we expect it may add depth and contrast as grist for the mills of your integral reviews. Over the course of time, we hope the abstract notion of the integral paradigm will gradually result in new concrete, essential experiences, and thus foster further integration. We hope new concrete meanings of *re-view* take root in all of us during our authoring, editing, and reading experiences of engaging each IR issue. And we're hopeful that as IR attracts a wide range of authors and readers, and additional competencies and diversity on an editorial board, that we co-create a substantive contribution to support translative and transformative change in our shared world. We anticipate that we all will gradually realize more and more of the transformative potentials of transdisciplinary and transcultural approaches, right down here on the ground where complex social change occurs and more of which is sorely needed.

IR's Relation with its Publisher's Mission

Integral Review is the formal publishing arm of ARINA, Inc., a 501(c)(3) non-profit corporation that was organized in 2004 in the U.S. to carry out its global mission. ARINA's mission is to model, teach, research, publish, promote, and institutionalize holistic, integral understandings and processes that are incorporated into efforts to address complex issues within individual, social, and global needs. Its service area is the planet, and its tax-exempt purposes are the public good (charitable), educational, and social scientific research. Integral Review will be the site of original publication of integral research and project evaluations carried out under ARINA's auspices. IR furthers ARINA's mission by publishing the just-mentioned work along with other works that meet its criteria, resonate with its philosophy, and fulfill its publication purposes.

The acronym ARINA stands for some core ideas that we have explicated in this introduction to IR: Acting / Researching / Integrating Associates Network. Please visit ARINA's website at www.global-arina.org to learn about its range of resources and activities and to associate with us.

Jean Gebser: Das integrale Bewusstsein

Kai Hellbusch

Zusammenfassung: Um den Begriff des integralen Bewusstseins bei Jean Gebser deutlich werden zu lassen, werden die Bewusstseinsstrukturen in ihrem konzeptionellen Stellenwert erläutert, bevor jede einzelne vorgestellt wird. Die Kenntnis der bisherigen Bewusstseinsstrukturen ist Voraussetzung für die Kenntnis des integralen Bewusstseins, das sich aber nicht in der Integration des Früheren erschöpft, sondern seine eigene Aufgabe hat: die Realisierung der Zeit, also die Konkretion der den Bewusstseinsstrukturen zugehörigen Zeitformen. Dadurch entsteht eine neue Freiheit, die als bewusste Annäherung an das Göttliche, den „Ursprung“, zu verstehen ist.

Schlüsselwörter: Bewusstseinsstrukturen, Mutation, integrales Bewusstsein, Konstitutionstheorie, neue Wirklichkeit, Zeit.

Abstract: The Swiss-German philosopher Jean Gebser is introduced as the first to describe the integral worldview in detail. The author sketches Gebser's biography, explains his basic assumption of a universal consciousness from which basic structures of consciousness emerge, and describes the different stages of consciousness development from archaic to magic to mythic to mental to integral. The integral structure of consciousness is presented in its main characteristics as an attitude towards the world, to ourselves and in particular to time.

Key words: Structures of consciousness, mutation, integral consciousness, universal origin (*Ursprung*), new reality, time

Warum Gebser?

Die Rede von einem neuen Bewußtsein, das häufig als *integrales Bewusstsein* bezeichnet wird, ist geläufig. Das Wort integral ist verführerisch, denn es erinnert an Ganzheit, Zusammenfassung, Komplettheit, und es wird auch in diesem Sinne verwendet, z.B. von Wilber, aber auch von etlichen weniger bedeutenden Autoren, die sich um Neues bemühen.

Gebser hingegen benutzt den Begriff in einem sehr speziellen Sinne. Diesen Sinn zu verstehen, ist aus zwei Gründen wichtig: zum einen hat Gebser den Begriff allererst eingeführt, seine Begriffsbestimmung ist also das „Original“; zum anderen birgt dieser Begriff einen besonderen Zugang zur Welt, der sonst verschlossen bliebe. Gebsers Bewusstseinsstrukturen sind etwas ganz Einzigartiges, das es sonst in der Kulturtheorie nicht gibt, und sich mit ihnen vertraut zu machen, kann einen echten Orientierungsgewinn in der heutigen Welt bedeuten. Zudem sind es so wenige, dass sie leicht zu überblicken sind, und sie sind gleichzeitig so schwierig zu verstehen, dass ihre Erkenntnis eine Herausforderung darstellt. Vor allem aber sind sie sehr wirklichkeitsgerecht. Dadurch bieten sie eine vorzügliche Voraussetzung, um unsere Welt besser zu verstehen und zugleich eine neuartige Grundlage, auf der fruchtbringende Forschung stattfinden kann.

SOME RIGHTS RESERVED

Wer war Jean Gebser?

Jean Gebser war ein deutscher Philosoph, der 1905 in Posen geboren wurde und 1973 als eingebürgerter Schweizer in Bern starb. Einige Stichworte zu seinem Lebensgang: 1929 Aufbruch nach Italien, dann Wanderungen in Südfrankreich, 1931-1936 in Spanien, persönliche Bekanntschaft mit Garcia Lorca, Picasso und der ganzen Clique der spanisch-französischen Avantgarde, übersetzt zeitgenössische spanische Lyrik und schreibt sein erstes Buch: *Rilke und Spanien*. 1937-1939 nach der Flucht aus Spanien in Paris. Ab August 1939 dauernder Aufenthalt in der Schweiz, zuerst in Ascona, Verbindung mit dem Eranoskreis C.G. Jungs, später in Burgdorf und Bern. Seine Hauptwerke entstehen: *Abendländische Wandlung* (1943), *Ursprung und Gegenwart* (1949-1952), *Asien lächelt anders* (1968), *Der unsichtbare Ursprung* (1970). Dozent am psychologischen Seminar des Institutes für angewandte Psychologie in Zürich. 1967 Honorar-Professor für vergleichende Kulturlehre an der Universität Salzburg.

Gebser lebte ein schillerndes, unstetes Leben mit vielen Wanderjahren, war geistig ungewöhnlich eigenständig, gehörte philosophisch keiner Richtung an und besaß nie eine dauerhafte Anstellung, die ihm ein sorgenfreies Leben gewährt hätte. Daher fehlte ihm auch die Möglichkeit, seine Konzeption der Bewusstseinsstrukturen so breit auszuführen, dass sie einen größeren Bekanntheitsgrad hätten erlangen können. Gebser hatte zu seinen Lebzeiten durchaus berühmte und einflussreiche Freunde, aber auch die konnten seinem Werk nicht das Gehör verschaffen, das es verdient. Die Gründe für die relative Unbekanntheit seines Werkes sind vermutlich mannigfaltig; sicherlich gehört dazu eine ganz spezifische Schwierigkeit, die dieses Werk demjenigen macht, der es kennenlernen möchte. Zu dieser Schwierigkeit, die mit der Möglichkeit des Nachvollziehens zusammenhängt, gehört der Begriff der Bewusstseinsstrukturen.

Was sind die Bewusstseinsstrukturen?

Gebsers Begriff der Bewusstseinsstrukturen besagt anderes, als man es sonst vom Wort Bewusstsein kennt, und es ist von essentieller Wichtigkeit, dass man die Bedeutung der Bewusstseinsstrukturen und ihren Stellenwert versteht, wenn man die Rede vom Integralen Bewusstsein verstehen will.

Gebsers Bewusstseinsstrukturen sind so etwas wie Brillen oder vielmehr: virtuelle Ganzkörperkontaktlinsen, durch die wir die Welt immer schon und notwendigerweise sehen. Wir können also keinen Blick auf eine vermeintlich wirkliche Welt werfen, weil wir immer durch irgendwelche Bewusstseinsstrukturen die Welt wahrnehmen. Alle unsere gebräuchlichen Einteilungen des Menschlichen – wie Gefühl, Intellekt, Triebe, Wille, Empfindung usw. – sind für Gebser abhängig von der uns dominierenden Bewusstseinsstruktur. Und natürlich auch alle Formen des Geistigen, die wir im Laufe der Geschichte benannt haben, wie das Denken, die Vernunft, der Logos, der Verstand, die Ratio usw. Wenn die Bewusstseinsstrukturen allem zugrunde liegen, bedeutet dies, dass wir nicht von *einer* schlechthin menschlichen Geistesqualität sprechen können, z.B. von dem Menschen als „vernünftigem Wesen“ wie in der Aufklärung oder als „das den Logos besitzende Tier“ des Aristoteles oder dergleichen. Diese Bezeichnungen drücken nicht allein die Tatsache aus, dass der Mensch an einem Geistigen teilhat, sondern sie bezeichnen durchaus konkrete Attribute des Geistigen, die immer mit logischem und gerichtetem Denken zu tun haben, wie jeder weiß, der sich mit der Philosophie der Aufklärung oder mit der griechischen Philosophie beschäftigt hat.

Die These von genau einer wesentlich menschlichen Geistesfähigkeit, bzw. ihre Widerlegung, ist keineswegs trivial, wie man meinen könnte, wenn man sich vor Augen hält, dass es seit Kant doch etliche philosophische, psychologische und neurobiologische Konstitutionstheorien gibt, die alle davon ausgehen, dass der Mensch sich seine Welt macht und nicht eine fertige Welt zur Kenntnis nimmt. Aber der Gedanke der *verschiedenen* Grundlagen und Fähigkeiten zu solcher Konstitution, also dessen, was bei Gebser Bewusstseinsstrukturen heißt, ist immer noch neu. Damit bringt Gebser eine *Dynamik* in unser Menschenbild; er überschreitet so die *Statik* der Vorstellung eines Menschen an sich, wie sie sich durch unsere gesamte Kulturgeschichte zieht. Dieser dynamische, variable Konstitutionsgedanke Gebsers spielt vor allem in unserer *Lebenswelt* noch keine Rolle, im besonderen nicht in der Politik: dort beruft man sich gern auf die Menschenrechte und andere Aspekte des aufgeklärten Menschen, somit auf ein Produkt unserer abendländischen Kultur, das wegen seiner Beschränkung auf *ein* wesentliches Merkmal des Menschen – seine „Vernunft“ – von sehr eingeschränkter Allgemeinheit ist, auch wenn es gerade den gegenteiligen Anspruch stellt.

Gebser versteht also unter Bewusstsein in der Hauptsache diejenige Ausstattung des Menschen, die die Grundlage für alle Selbst- und Weltwahrnehmung bildet, und das eben auf verschiedenartige Weise, je nach geltender Bewusstseinsstruktur. Ohne dieses Bewusstsein gibt es kein Gefühl, keinen Gedanke, keine Sozialität, keinen Gegenstand, ja überhaupt keine Welt für den Menschen.

Gebser greift damit tiefer als viele andere. Seine einzigartige Konzeption der Bewusstseinsstrukturen geht nicht davon aus, dass es eine Welt gibt, die vom Menschen mehr oder weniger gut wahrgenommen wird, sondern dass die Welt erst vom wahrnehmenden Menschen hergestellt wird, und zwar in verschiedenen Zeiten und in verschiedenen Kulturen ganz unterschiedlich.

Wie und wo wirken Bewusstseinsstrukturen?

Ganz entscheidend für das Verstehen der Gebserschen Konzeption ist die Tatsache, dass die konstatierten Bewusstseinsstrukturen – die archaische, die magische, die mythische und die mentale – sich in der Geschichte nicht ablösen, sondern dass sie sich überdeterminieren – wie er es nennt. Das bedeutet, dass keine der Strukturen durch das Auftauchen der neuen verschwindet oder aufgehoben wird, sondern dass sie nur in ihrem Geltungsbereich eingeschränkt werden, dass alle Bewusstseinsstrukturen somit gleichzeitig wirken. Diese Charakteristik ist ein großer Unterschied der Gebserschen Konzeption zu entfernt vergleichbaren Konzeptionen unserer Tradition, beispielsweise zu Hegel. Bei Gebser stehen alle separierbaren Sektoren des Kulturellen in einem Zusammenhang, und dieser Zusammenhang ist immer auch abhängig von allen entstandenen Bewusstseinsstrukturen.

Außerdem gibt es bei Gebser eine klare Parallelität von Phylo- und Ontogenese. Was sich also in der menschheitlichen Entwicklung vollzogen hat, vollzieht sich in jedem einzelnen Menschenleben wieder. Jede einzelne Bewusstseinsstruktur wird im Laufe eines Menschenlebens akut und beherrschend.

Bei der Entwicklung und Etablierung der Bewusstseinsstrukturen gibt es jeweils eine Periode der *Effizienz* und eine der *Defizienz*. Erstere dient der vollständigen Entwicklung aller Möglichkeiten der jeweiligen Bewusstseinsstruktur, während die Periode der Defizienz eine Verkrustung des Erreichten bedeutet, seine Übertreibung. Qualität und Quantität, also Maß und Masse charakterisieren die zwei Hauptphasen jeder Struktur. Die defiziente Periode, die immer an übermäßiger Quantifizierung und an Erschöpfung des jeweils wirksamen Qualitativen zu erkennen ist, bietet als Positivum die Gewähr der Entstehung einer neuen Bewusstseinsstruktur.

Woher kommen nun aber die Bewusstseinsstrukturen?

Der Quell aller Bewusstseinsstrukturen ist für Gebser das Geistige, das Göttliche, das er auch den Ursprung nennt (daher der Titel seines Hauptwerkes *Ursprung und Gegenwart*). Alles Wesentliche und Entscheidende – und somit auch das, aus dem Neues entsteht – ist für Gebser gekennzeichnet durch seine Ursprünglichkeit. Der Ursprung bedeutet für Gebser das Grundphänomen schlechthin, er ist das Geistige, das zeitlos, bzw. vor oder über aller Zeit und Zeitlosigkeit ist und das alle Bewusstseinsstrukturen aus sich entlässt.

Das Entstehen der Bewusstseinsstrukturen aus dem Ursprung geht für Gebser also mit einem Ur-Sprung vonstatten, plötzlich sind sie da. Um dies auszudrücken, spricht Gebser von Bewusstseinsmutationen; das Realisationsfeld dieser Mutationen ist das menschliche Bewusstsein, und ihr Resultat ist eine jeweils veränderte, verwandelte Wirklichkeit.

Der Mensch assimiliert sich also mit seinem Bewusstsein an die jeweils neuen Arten des Geistigen, die dem Ursprung entspringen. Er ist dabei *nachholend*, der *Träger* der Ereignisse und das Manifestations*objekt* des Geistigen. Gebser geht dementsprechend davon aus, dass es eine quasi subjektive Seite in diesem Geschehen gibt, dass also das Geistige die neue Bewusstseinsstruktur von sich aus freigibt oder sie aus sich herausstellt. Wenn also eine neue Bewusstseinsstruktur da ist, wirkt sie schon an sich und treibt den Menschen an, sie zu realisieren. Das ist zugleich eine Entlastung und eine Verpflichtung.

Wichtig ist dabei vor allem, dass eine gegenseitige Zueinander-Bewegung stattfindet, dass das Angebot und die Verpflichtung der Bewusstseinsmutation aufgenommen und beantwortet wird. So wird auch ein weiteres Kennzeichen der Mutationen verständlich, das besonders in Umbruchzeiten wie der unseren vernehmbar ist: ihr Aufgabencharakter. Die neue geistige Struktur zu entwickeln und zu fördern, ist den Menschen aufgegeben, sobald die vorherige vollständig realisiert worden ist. Die Notwendigkeit, die nicht mehr tragenden und lebensfördernden defizienten Bewusstseinsformen zu überwinden, gebiert so die Realisierung der neuen Bewusstseinsstruktur.

Die einzelnen Bewusstseinsstrukturen

Die Kenntnis der einzelnen Bewusstseinsstrukturen ist für das integrale Bewusstsein, das in unserer Zeit realisiert werden soll, unabdingbar.

Die archaische Bewusstseinsstruktur

Die archaische Struktur ist die am schwierigsten zu beschreibende und zu verstehende, denn sie hat am wenigsten Distanz zum Ursprung. Nur diese Distanz, diese Differenz, ermöglicht ja die Beschreibung irgendwelcher Spezifika.

Gebser hält die archaische Struktur für sehr ursprungsnah, ja er meint, dass sie anfänglich mit dem Ursprung selbst identisch war. Kennzeichnend für die archaische Struktur ist die Identität von Mensch und Welt.

Die magische Bewusstseinsstruktur

Auch das magische Bewusstsein ist ein sehr frühes Stadium der Bewusstseinsentfaltung, aber es ist leichter zu evozieren als das archaische, weil die magischen Komponenten in unserer Welt leichter zu identifizieren und häufig anzutreffen sind, meistens in negativer Ausprägung. Vor allem aber *begann* mit der magischen Struktur die erste Etappe der Bewusstwerdung, nämlich die große Aufgabe des Menschen, durch Distanzierung die Unmittelbarkeit einer „natürlichen" Lebenswelt zu durchbrechen und sich seine spezifisch kulturellen Welten allererst herzustellen und damit sich seiner selbst und seiner Welt bewusst zu werden. Diese Aufgabe zieht sich durch alle bisher überblickbaren Strukturen und sie erreicht ihren Höhepunkt in der Vollendung der Welt als Gegenüber in der Renaissance.

Aus der archaischen Welt geschieht also jener erste entscheidende Schritt des Menschen zu einem dämmernden Bewusstwerden, der die magische Struktur einleitet. Hier löst sich der Mensch zum ersten Male aus seiner vollständigen Naturverhaftetheit, und es setzt ein erstes Bewusstwerden ein, das noch durchaus schlafhaft ist: es beginnt ein erstes Gegenübersein von Welt und Mensch. Damit taucht auch die Notwendigkeit auf, „nicht mehr nur in der Welt zu *sein,* sondern die Welt *haben* zu müssen", wie gesagt, der Beginn einer Entwicklung, die ihren Höhepunkt in der Renaissance fand. Der Mensch beginnt jetzt,

> ... ein Einzelner zu werden, eine Unität, die in der Welt vorerst noch nicht die Welt als Ganzes zu erkennen vermag, sondern jeweils nur die Einzelheiten oder Punkte, die sein noch schlafhaftes Bewusstsein treffen und die dann jeweils für das Ganze stehen. Die magische Welt ist somit auch die Welt des „pars pro toto", in dem „der Teil für alles" stehen kann und steht. Und die Wirklichkeit des magischen Menschen, sein Bezugsgeflecht, sind diese […] voneinander geeinzelten Gegenstände, Geschehnisse oder Taten, die beliebig miteinander vertauscht werden können: eine Welt des […] sinnreichen Zufalls, nämlich eine Welt, wo alles dem Menschen Zufallende von wirkender Gültigkeit ist, da zu allem und unter allen ein Bezug besteht. […] Der Mensch antwortet auf die ihm entgegenströmenden Kräfte mit den ihnen entsprechenden eigenen: er stellt sich gegen die Natur, er versucht sie zu bannen, zu lenken, er versucht, unabhängig von ihr zu werden; *er beginnt zu wollen.* Bannen und Beschwörung, Totem und Tabu sind die […] Mittel, mit denen er sich von der Übermacht der Natur zu befreien versucht. Trieb und Instinkt entfalten sich und bringen ein durch sie bedingtes und betontes Bewusstsein hervor, ein naturhaftes vitales Bewusstsein […]. Hier, in diesen Befreiungsversuchen des magischen Menschen aus der Eingeflochtenheit und der Gebanntheit in der Natur, mit der er anfänglich noch eins ist, hier beginnt der seit jener Zeit nicht mehr endenwollende Kampf um die Macht; hier [schon] wird der Mensch zum Macher. (Gebser GA II, 88f.)

Das Eingeflochtensein des magischen Menschen in die Natur und das Leben in und mit Einzelheiten bewirkte auch die eigentümliche Raum- und Zeitlosigkeit des magischen Menschen, ebenso wie seine ganz andere Palette an Fähigkeiten, als sie dem heutigen Menschen als normal zugesprochen wird. Gebser nennt hier vor allem die Telepathie und verweist auf Abbildungen magischer Menschen, auf denen die Figuren eine Kopfaura besitzen, sowie solche, auf denen mundlose Gesichter abgebildet sind.

In der heutigen Welt verdiene, so Gebser, das Magische in zweifacher Hinsicht besondere Aufmerksamkeit. Einerseits sei die Gefügtheit der Welt, die Wirksamkeit des magischen Vital-

Konnexes eine Realität, die anzuerkennen sei. In diesem Sinne versteht Gebser die sogenannten Zufälle, die im Leben geschehen: sie zeigten

> ... jene tiefste Gefügtheit des Lebens, die eben doch noch die Kraft hat, unsere Reaktionen zu richten oder zu lenken, so dass wir dieser Gefügtheit nicht entgehen können“. (Gebser GA VI, 364)

Dies ist die *magische* Gefügtheit des Lebens, die immer zur Geltung kommt, ob man sich ihrer bewusst ist oder nicht, und sie gilt natürlich genauso bei den unerfreulichen wie bei den freudigen und beglückenden Begebnissen. Wie mächtig diese Gefügtheit ist und wie unfraglich wir in solchen Gefügen stehen, lässt sich z.B. bei den Familienaufstellungen (und natürlich auch an den anderen Aufstellungen) nach Hellinger erleben.

Auf der anderen Seite gibt es in unserer Welt viele Verführungen zum Magischen, das ohnehin schon in den meisten heutigen Menschen vielfach überbetont ist. Daher ist es – bei aller Anerkennung der magischen Welt – ganz und gar unstatthaft für einen heute verantwortlichen Menschen, das Magische in sich so weit zu stärken, dass es bestimmenden Charakter annimmt. Gebser spricht besonders hinsichtlich der massenpsychologischen Phänomene des 20. Jahrhunderts von der „reaktivierten magischen Disponibilität des heutigen Menschen“. (Gebser GA II, 104) Stattdessen kommt es darauf an, sich des Magischen bewusst zu sein und *mit*, nicht aber *in* der magischen Welt zu leben. Das magische Geschehen spielt sich in der naturhaft-vitalen, ichlosen und raum- sowie zeitlosen Sphäre ab, und diese fordert eine Preisgabe unserer heutigen Bewusstseinsfähigkeit.

Heute kann man vor allem *defizient* Magisches reichlich beobachten: das Zurücksinken in ichlose und raum- und zeitlose Situationen findet sowohl in den zahlreichen Massenveranstaltungen statt, wie auch in vielen tranceorientierten esoterischen Übungsformen, welcher Tradition auch immer, sogar in der Techno-Musik. Auch das fanatische Vertreten bestimmter Ideen ist defizient magisch, genauso wie das Streben nach Macht über die Natur durch Technik und auch die Besessenheit von der Sexualität, denn das Magische ist wesentlich auf der Ebene des Vitalen und Triebhaften angesiedelt.

Dies bedeutet, dass eine besondere Aufmerksamkeit dem Magischen gegenüber angemessen ist, es bedeutet aber auch, dass die magischen Aspekte in das Ensemble der Bewusstseinsstrukturen zu integrieren sind.

> Nur wo die magische Struktur heute im einzelnen noch trieb- und instinktgesichert sich auswirkt, erfüllt sie ihren eminenten und lebenspendenden Wert.“ (Gebser GA II, 105)

Deutlich wird ein gelungenes Integrieren des Magischen an einem entspannten Verhalten zur Sexualität, an der Nichtanfälligkeit für Schlagwörter und -ismen aller Art und auch an der Fähigkeit zum guten Horchen, auf äußere und innere Stimmen. Das Akustische ist stark magisch gefärbt. Entsprechend ist Hörigkeit defizient magisch.

> Gehören, Gehorchen, Hörigsein sind immer Unterstellungen unter die Macht, die wir den Dingen, Geschehnissen oder Menschen sei es besitzlüstern, sei es autoritätsgläubig, sei es sexuell […] zubilligen“. (Gebser GA II, 105f.)

Um hier das rechte Maß zu finden, ist es nötig, um das Magische und seine Macht zu wissen.

Die Realisationsform, die Gebser dem Magischen zuschreibt, ist das *Erleben*. Dieser heute wieder so hochgeschätzte Begriff impliziert oftmals einen „Ganzheitsbezug", der aber vielmehr ein Einheitsbezug sein dürfte. Ganzheit kann in Gebsers Sinn nur durch die Integration von Verschiedenem entstehen, während dem Magischen die Einheitlichkeit schon an sich zu eigen ist, ohne dass ihr eine Differenzierung vorausginge.

Die mythische Bewusstseinsstruktur

Die Aufgabe des mythischen Bewusstseins besteht in der Entwicklung der Psyche, der Bewusstwerdung der Seele. Seele meint hier ein inneres Bild-Bewusstsein, nicht aber das personale Zentrum – die Seele in *diesem* Sinne wird erst mit dem mentalen Bewusstsein Wirklichkeit.

Die mythische Welt ist nicht sehr leicht von der magischen zu unterscheiden, besonders wenn vor allem geschichtlich entfernte Völker oder konkrete Ethnien im Zentrum des Interesses stehen. Das liegt vor allem daran, dass mit der magischen Bewusstseinsstruktur die große Aufgabe der Bewusstwerdung begann, die immer noch besteht und der also auch das Mythische und das Mentale unterstehen. Zudem ist die Außenorientierung des Magischen dafür verantwortlich, dass grundlegende Formen der Weltbewältigung entwickelt wurden, die auch in der mythisch dominierten Zeit weitergeführt wurden. Der Bereich der Macht ist daher im Mythischen keineswegs beschnitten oder verlassen; Macht ist auch für dieses Bewusstsein ein Kennwort. Die mythische Struktur führt also das fort, was in der magischen zum Programm geworden war: das Herauslösen des Menschen aus seiner Natürlichkeit. Die spezifische Leistung des mythischen Bewusstseins in diesem Programm ist das Bewusstmachen der Zeit als der nicht-örtlichen und nicht-räumlichen Dimension der Natur, und das bedeutet gleichzeitig die Schaffung der menschlichen Voraussetzung für ein Zeit-Bewusstsein: die Schaffung, also die Bewusstwerdung der Seele.

Das Mythische ist daher auf keinen Fall zu verwechseln mit Magischem plus Mythos. Es stellt vielmehr eine eigene Qualität dar, die durch die Entdeckung der Innenwelt, der Seele geprägt ist. Auch wenn das Magische zu Zeiten der entwickelten mythischen Struktur noch sehr stark präsent ist und sich in vielen kulturellen Erscheinungen des Mythischen als sehr lebendig aufweisen lässt, ist es dennoch „überdeterminiert" durch den neuen Sinn des Mythischen.

Die *Polarität* ist das wesentliche Kennzeichen des Mythischen, und sie drückt auch den Dimensionengewinn aus und damit das Neue, den Fortschritt gegenüber dem Magischen.

> War die archaische Struktur der Ausdruck der nulldimensionalen Identität und der ursprünglichen Ganzheit, war die magische der Ausdruck der eindimensionalen Unität und naturverwobenen Einheit – so ist die mythische Struktur Ausdruck der zweidimensionalen Polarität. (Gebser GA II, 113.)

Die Signatur, die Gebser dem Mythischen zuordnet, ist daher – und weil die mythische Struktur zu einer Bewusstwerdung der Seele, also der Innenwelt führt – der

> ... *Kreis*, der stets auch Symbol der Seele war. Der geeinzelte Punkt der magischen Struktur erweitert sich zu dem zweidimensionalen, die Fläche einschließenden Ring. Er umfasst alles Polare und bindet es ausgleichend ineinander". (Gebser GA II, 113)

Das perfekte Symbol des Mythischen ist daher das chinesische Tai-Chi: die Polarität im Kreis.

Einen deutlichen bildlichen Ausdruck für das mythische Bewusstsein findet man immer dann, wenn dargestellte Figuren nicht mehr mit einer Aura, sondern mit einem Mund versehen sind. Um dem Mythos seine sprachliche Gestalt zu verleihen, ist der Mund nötig.

Das Mythische ist überhaupt eminent sprachlich. Alle sprachliche Kunst ist daher stark daran gebunden. Dichtung kann zwar andere Bewusstseinsstrukturen ausdrücken, aber sie kann sich nicht vom Mythischen lossagen, ebenso wie die Philosophie sich nicht vom Mythischen ablösen kann, solange sie sprachlich bleibt.

Die Realisationsform des Mythischen ist das *Erfahren*. Das Entdecken der Seele ist ein Erfahren, und so sind Erkundungs-, besonders Meeresfahrten häufige Mythologeme. Diese können erst entstehen, wenn die Seele sich bildet, und die Seele braucht sie zu ihrer Bildung. Erfahrung ist immer

> ... polhaft, weil das Erfahren nicht nur ein Erleiden ist, also etwas, das uns geschieht, sondern gleichzeitig stets auch halbbewusste zwielichtige Handlung. (Gebser GA II, 344)

So ist durch das Erfahren der erste Schimmer eines Ich-Bewusstseins gegeben. Durch Erfahrung kommt man zur Einsicht; dies

> ... unterscheidet jede Erfahrung von dem bloß punkthaften Erleben und auch vom nur kausalen Verstehen, und es ermöglicht das bewusstseinsbildende Erinnern, das immer ein innerer Vorgang ist. (Gebser GA II, 344.)

Die außerordentlich große Macht der Erinnerung für das mythische Bewusstsein findet seinen Ausdruck auch im Ahnenkult, der in von diesem Bewusstsein bestimmten Kulturen immer anzutreffen ist. Und auch das Erinnern verknüpft das Mythische mit dem Dichterischen, denn die Erinnerung, Mnemosyne, ist die Urmuse. Die Polarität von Wachheit und Traum ist ebenfalls Zeichen des Mythischen.

Auch das Mythische ist heute überall zu finden: der Sinn für Geschichten und das Sichverlieren in Geschichten und im Imaginären sind häufige Erscheinungen, wenn auch oft auf das Verfolgen von Fernsehfilmen und -serien reduziert. Bei den Kindern findet man es noch in seiner wahren, lebensförderlichen Ausprägung. Die Mythenforschung durch und nach C. G. Jung hat gezeigt, wie sehr allgemeine Symbole wirksam sind. Sie hat aber auch in bestimmten Kreisen zu einer Inflation des Symbolischen und des Psychischen geführt, die genauso defizient ist wie die Sucht nach Geschichten. Das Handeln aus dem Herzen, das hingegebene Glauben sind mythisch.

Die mentale Bewusstseinsstruktur

Bei Gebser bezeichnet das Mentale diejenige Bewusstseinsstruktur, die unsere Welt nach wie vor bestimmt, wenn auch vor allem in ihren defizienten Ausformungen. Er benutzt das Wort mental, weil es durch seine Abkunft vom griechischen Wort menos, das „Vorsatz, Zorn, Mut, Kraft“ bedeutet, und vom lateinischen mens, das „Absicht, Zorn, Mut, Denken, Gedanke, Verstand, Besinnung, Sinnesart, Denkart, Vorstellung“ bedeutet, das Wesentliche dieser Struktur ausdrückt.

Mit diesen Inhalten sieht Gebser bereits das Entscheidende gegeben: die grundlegende Novität ist das In-Erscheinung-Treten des *gerichteten Denkens.* Das gerichtete Denken ist nicht mehr polbezogen, sondern es ist

> ... objektbezogen und damit auf die Dualität, diese herstellend, gerichtet, und erhält seine Kraft aus dem einzelnen Ich. (Gebser GA II, 128.)

Das Moment des Sinngebens und Richtens ist also von außerordentlicher Bedeutung für die mentale Welt, wie Gebser auf vielfältige Art nachweist: Das Richten, etwas richtig und recht machen, bedeutet immer auch, einem Phänomen Sinn zu geben. Viele Sprachen haben ein gemeinsames Wort für Richtung und Sinn. Seit alters her und vielleicht durch die unterschiedlichen Hemisphären des Gehirns begründet, ist

> ... die linke Seite die Seite des Unbewussten, des Ungekannten; die rechte Seite dagegen die Seite der Bewusstheit, der Wachheit. In welchem Maße sich diese Wertung verstärkte, geht daraus hervor, dass in den heutigen europäischen Sprachen »rechts« eben nicht nur einfach rechts, sondern auch „richtig [und] gerade“, im Sinne des Zum-Ziel-Führens, bedeutet.

Das Griechische hat als die erste Sprache, die die Entstehung des mentalen Bewusstseins ausdrückt, auch als erste die Schriftrichtung von links nach rechts genommen. Ältere Sprachen wurden von oben nach unten oder von rechts nach links geschrieben. Auch das Einsetzen eines festen Rechts, einer Gesetzgebung, ist ein „Akt, der nur durch ein erwachtes Bewusstsein vollzogen werden kann“. Insofern sind die großen Gesetzgeber wie Moses, Lykurg und Solon zugleich Wegbereiter und Ausdruck des entstehenden mentalen Bewusstseins. Hiermit einhergehend sind sie aber auch Begründer oder Verstärker des Patriarchats, denn die rechte Seite steht auch für das männliche, das Recht für das väterliche Prinzip. (Gebser GA II, 134f.)

Mit dem neuen mentalen Bewusstsein entsteht auch eine neue Stellung des Menschen zur Welt, und sein Selbstverständnis gegenüber dieser Welt verändert sich: die Welt des mentalen Bewusstseins ist erstmals ausdrücklich

> ... *eine Welt des Menschen;* das will sagen, es ist eine […] Welt, in welcher „der Mensch das Maß aller Dinge“ ist (Protagoras); in welcher der Mensch selber denkt und dieses Denken richtet; und es ist eine Welt, die er misst, nach der er trachtet, eine materielle Welt, eine Objektwelt, die ihm gegenübersteht. (Gebser GA II, 132.)

Die Welt des Menschen ist also auch die Welt als Gegenüber. Was mit dem Magischen begonnen hatte: Abstand zur Welt zu bekommen, vollendet sich im Mentalen, indem die Welt als das Andere, und das heißt: als Gegenüber angesehen wird. Die räumliche Orientierung und die Betonung des Materiellen und des Messenden und damit des Messbaren sind typisch für die mentale Perfektionierung dieser Außenorientierung. Auch der Aspekt der Quantifizierung gehört zu dieser Betonung des Messenden; er ist durchaus nicht erst mit dem Defizienten der Neuzeit verknüpft, das in Galileis Maxime, alles messbar zu machen, zum Ausdruck kommt, sondern er gehört zum Mentalen und erscheint dementsprechend schon in dessen Anfang. So stand über Platons Akademie der Satz: „Nur wer der Geometrie kundig ist, möge eintreten“. Gaia, die Mutter Erde, ist für den mentalen Menschen ein messbares Objekt geworden.

Die Vollendung der Aufgabe des mentalen Bewusstseins, die vollständige Eroberung und Meisterung des Raumes, wurde in der Renaissance geleistet, als die Perspektive voll entwickelt und handhabbar wurde. Das ist bei Leonardo geschehen, nach all den Vorversuchen, die nicht nur die bildende Kunst seit dem Mittelalter bestimmten, sondern die auch zur Entdeckung der *Landschaft* geführt haben. Dieser uns so selbstverständliche Begriff setzt ein perspektivisches Bewusstsein voraus, das keineswegs eine Selbstverständlichkeit ist. Gebser benutzt das später immer wieder gern zitierte Beispiel von Petrarca, der bei der Ersteigung des Mont Ventoux eine große Erschütterung erlebte, die er 1336 in einem Brief mitteilte. „

> Diese Darstellung ist für die damalige Zeit ein geradezu epochales Ereignis, denn sie bedeutet nichts Geringeres als *die Entdeckung der Landschaft*, und in ihr kommt ein erstes Aufleuchten jenes Raum-Bewusstseins zum Durchbruch, das in der Folge grundlegend die Stellung des europäischen Menschen in und zu der Welt verändert. (Gebser GA II, 40.)

Aber nicht nur die Realisierung des Raumes war ein Kennzeichen der mentalen Bewusstseinsstruktur, sondern auch die Schaffung eines der Verantwortung fähigen Ichs. Alle Verantwortung setzt ein gefestigtes Ich voraus, und diese Errungenschaft ist heute in unserer Gesellschaft, die der individuellen Person so wenig Wert einräumt zugunsten ihrer Gebrauchbarkeit für wirtschaftliche Prozesse, in Gefahr, verloren zu gehen. Mit dem mentalen Bewusstsein entstehen also neue Weltwirklichkeiten: so auch die Fragen und Konstellationen, die uns heute noch als selbstverständlich erscheinen, wie die Frage nach der Wahrheit, nach Realität, nach „Welt“. Eine weitere Neuigkeit ist das Empfinden für Wahrheit und Gerechtigkeit an sich. Es entstanden nicht nur die logischen und die ethischen Grundsätze, sondern auch die entsprechenden psychischen Konstellationen, die uns heute ganz normal erscheinen; daran erkennt man auch die immer noch währende Dominanz des mentalen Bewusstseins. So wurde z. B. immer gelogen, aber das Schamvolle am Lügen ist ganz und gar mental. Für eine „gute Geschichte“ wird aber noch immer ohne Scham gelogen, und Kinder eines gewissen Alters lügen auch ganz ohne Scham, wie es für ein magisches oder mythisches Bewußtsein völlig in Ordnung ist.

Die integrale Bewusstseinsstruktur

Das integrale Bewusstsein, das also die Neuigkeit ist, die in unserer Zeit zur Realisierung drängt, ist nicht leicht zu fassen. Gebser benutzt zur Kennzeichnung *aller* Bewusstseinsstrukturen Charakteristika, die das mentale Bewusstsein kennzeichnen, und er versieht sie mit Präfixen, die verschiedene Stufen des Noch-nicht – oder des Nicht-mehr – ausdrücken, wie prärational für die magische Struktur, irrational für die mythische, rational für die mentale und arational für die integrale Struktur, die immer die Vorsilbe a bekommt (aperspektivisch usw.). Bezüglich des Integralen entsteht dadurch der Eindruck, es sei wie Gott in der negativen Theologie nur über Negationen annäherbar, auch wenn Gebser deutlich darauf hinweist, dass „die Vorsilbe 'a' nicht im Sinne des *Alpha negativum*, sondern in dem des *Alpha privativum*“ zu verstehen sei, also nicht verneinenden sondern befreienden Charakter habe. (Gebser GA II, 25.) Dieser Eindruck der Negation ist nur aus mentaler Perspektive richtig; aus dieser Perspektive ist er auch gerechtfertigt, weil das Mentale eine Art Vollendung des Menschen, nämlich seine Vollendung unter Fortschritts- und Herrschaftsaspekten, darstellt. Aber Gebser belässt es nicht bei den Kennzeichnungen, die auf den Eigenschaften des Mentalen beruhen, sondern er entwickelt zum Zwecke der erwünschten Antizipation des integralen Bewusstseins auch eine eigene Begrifflichkeit. Diese Begriffe können hier nicht erläutert werden; nur einen dieser Begriffe möchte ich nennen, weil er das Wesentliche – wie ich finde – sehr schön ausdrückt.

Vorher aber noch eine Bemerkung zu der generellen Schwierigkeit, etwas so fundamental Neues wie eine neue Bewusstseinsstruktur wahrzunehmen: Dem Menschen ist also aufgegeben, das in seltenen Momenten seiner Geschichte – seiner individuellen wie seiner Gattungsgeschichte – erscheinende Neue in seinem Bewusstsein zu realisieren. Diese Aufgabe ist außerordentlich schwierig, denn das wirklich Neue sieht, wenn es erstmals wahrgenommen wird, überwirklich und übernatürlich aus, weil es von der alten Bewusstseinsstruktur wahrgenommen wird. Und vor allem sieht es nicht nur so aus,

> ... sondern von jener alten Bewusstseinsstruktur aus betrachtet *ist* es *über* ihrer Wirklichkeit, *ist* es tatsächlich *über* ihre Natur hinaus.

Deshalb sträuben sich die Menschen, es wahrzunehmen, und sie machen den Versuch, es dem Alten anzugleichen. Dadurch aber verliert es

> ... seinen Echtheits- und Wahrheits-Charakter. Bei diesen Versuchen, das Neue vom Alten her mit den alten Begriffen erklären zu wollen,

ist man natürlich ständig der Gefahr von Missverständnissen und Missdeutungen ausgesetzt. Um diese Misslichkeiten zu vermeiden und um der Ursprünglichkeit des Neuen gerecht zu werden, hält Gebser es für unumgänglich, sich über das bisher Entwickelte klar zu werden. Auch diesem Zweck gilt seine Untersuchung der älteren Bewusstseinsstrukturen. (Gebser GA II, 71.)

Dennoch reicht eine bloße Kenntnis der älteren Bewusstseinsstrukturen nicht aus: Der besondere Anspruch Gebsers besteht gerade darin, dass jeder die Bewusstseinsstrukturen bei sich selbst wiederfindet und so ihre Existenz bestätigt. Gebser nennt dies *Konkretion*. Das ist natürlich ein besonders hoher Anspruch: der ganze Mensch ist hier gefragt, mit all seinen Erlebnis- und Erfahrungsmöglichkeiten, mit seiner ganzen Fähigkeit, sich selbst zu durchschauen, indem er sich klar und durchsichtig wird. Dieser Anspruch lässt den intellektuellen und wissenschaftlichen Umgang mit der gesamten Konzeption als ungenügend erscheinen und trägt daher wesentlich dazu bei, sie nicht in die Wissenschaft, also auch nicht in die akademische Philosophie, hineinzulassen.

Die Integration der älteren Bewusstseinsstrukturen ist derjenige Aspekt des integralen Bewusstseins, der relativ leicht zugänglich ist. Sie, die Bewusstseinsstrukturen, sollen jedem, der am integralen Bewusstsein teilhaben will, durchsichtig werden, ihr Wirken soll gesehen werden, unsere Teilhabe an ihnen soll bewusst werden, und wenn das gelingt, ist ein gewisser Schritt zum integralen Bewusstsein getan. Dass dies aber gelingen kann, ist von bestimmten Fähigkeiten abhängig, und hier kommt der angekündigte Begriff ins Spiel.

Dieser Begriff und eine dieser Fähigkeiten ist nämlich das *Wahren*, das nicht nur wahrnehmen heißt, auch nicht nur gewahr werden, was ja schon eine gewisse Anerkennung des Wahrgenommenen impliziert, sondern zu dem auch ein Wahrgeben gehört, also ein zugewandter, bejahender, wenn man so will: liebender, auf jeden Fall aber ein aktiver Aspekt des Menschen, der da wahrnimmt und wahrgibt. Das Wahren gilt Gebser als die Realisationsart des integralen Bewusstseins, es entspricht also dem Erleben des magischen, dem Schauen und Erfahren des mythischen und dem Folgern und Vorstellen des mentalen Bewusstseins.

Das Wahren als Realisationsform des integralen Bewusstseins bedeutet auch die große Neuigkeit, die der so gewahrten Welt zu eigen ist: sie ist nicht mehr die Welt als Gegenüber, wie sie mit dem magischen Bewusstsein zuerst entstand und wie sie vom mentalen Bewusstsein perfektioniert worden ist. Mensch und Welt nehmen jetzt eine andere Beziehung auf, die von einem innigeren Bezug und neuartiger Transparenz geprägt ist.

Die Welt als Gegenüber und der ihr entsprechende Mensch sind also zu überwinden, bei Gebser und übrigens auch bei einem weiteren großen Philosophen, der in seiner wahren Leistung noch immer nicht dargestellt worden ist, obwohl eine Unmenge an Literatur über ihn existiert: bei Nietzsche. Die große Klammer, die bei Gebser die drei Bewusstseinsstrukturen des Magischen, Mythischen und Mentalen zusammenhält, zeigt, dass die Realisierung der Welt des Integralen einen besonders großen und deutlichen Schritt darstellt, dass sie eine echte Veränderung des Humanum bedeutet.

Wodurch zeichnet sich das integrale Bewusstsein nun hauptsächlich aus? Es hat wie jede Bewusstseinsstruktur seine Aufgabe, und diese Aufgabe besteht in der Realisierung der *Zeit*, des Zugleich, wie Gebser sagt.

Um diese Realisierung zu bewerkstelligen, müssen alle den Menschen mitkonstituierenden Zeitformen anerkannt werden; man muss also den Mut aufbringen, die prärationale magische Zeitlosigkeit ebenso wie die irrationale mythische Zeithaftigkeit und den mentalen Zeitbegriff als wirkend anzuerkennen und sie entsprechend zu leben. Mut ist dazu nötig, denn es verlangt eine erhebliche Selbstdistanzierung und damit Selbstüberwindung, die dazu zwingen, das vertraute Selbstgefühl, das man sich im Laufe der Jahre erworben hat, zu verlassen. Das Ergebnis dieser Anerkennung bezeichnet Gebser als *Zeitfreiheit*, was nicht etwa bedeutet, dass man sich dieser früheren Zeitformen entledigt, die ja jeden Menschen mitkonstituieren, sondern Zeitfreiheit heißt zuerst einmal ein *Freisein zu* den früheren Zeitformen. Diese Art Freisein, die Gebser hier meint, geht aus der Konkretion – wie eben erwähnt auch ein Begriff, der zum integralen Bewusstsein gehört – und der Integration aller Zeitformen hervor; es kann daher nur von einem Bewusstsein geleistet werden, das sich „über" die bisherigen Zeitformen zu stellen vermag. Auf diese Art erfolgt – so Gebser – eine bewusste Annäherung an den Ursprung. (Gebser GA III, 388) Er bezeichnet daher die Zeitfreiheit sogar als „die bewusste Form des ursprünglichen Vorzeithaften" (Gebser GA III, 482), und stellt damit einen sehr weiten Horizont für das integrale Bewusstsein her, der mit den hohen Formen spiritueller Erleuchtung vergleichbar ist.

Durch diese Realisierung eines wesentlichen Aspekts jeder Bewusstseinsstruktur, nämlich der ihr entsprechenden Zeitform, sind die Bewusstseinsstrukturen im Ganzen realisiert und transparent. Daher ermöglicht die Zeitfreiheit, die durch das Integrieren der verschiedenen Zeitformen erreicht wird, den Zugang zu dem, was Gebser „das Geistige" nennt: „das Befreitsein von der Zeit" bedeutet „das Freisein zum Geistigen" (Gebser GA III, 402f.) Dieser Begriff des Geistigen bezeichnet bei Gebser die Region, die alle Bewusstseinsstrukturen aus sich entlässt; in anderer Terminologie ist dies das Göttliche oder auch Gott, welche Bezeichnung Gebser allerdings nur im Kontext des mentalen Bewusstseins verwendet, wohl wegen der väterlichen Konnotationen.

Selbstverständlich hat das integrale Bewusstsein sehr viele andere Aspekte, die fasslicher sind als der Zeitaspekt, auch solche, die man mit Bezug auf das mentale Bewußtsein benennen kann. So überschreitet das integrale Bewußtsein die rationale Eindeutigkeit und das dualistische Entweder-Oder des mentalen Bewusstseins, es lässt die Welt als vielfältig strukturiert und komplex erscheinen, es öffnet die Augen für die vielen verschiedenen Wahrheiten, die da sind und gesehen werden wollen. Jedes einzelne Ding, jedes Material, jede Tonart und natürlich jeder Mensch ist eine solche Wahrheit.

Daher mutet der starke Bezug des integralen Bewusstseins zur Zeit, den ich hier betone, zunächst ungewöhnlich an. Gebser stellt das integrale Bewusstsein auch in unmittelbare Nähe zum Satori und zum universalen Bewußtsein Aurobindos, die ja beide ohne einen solchen ausdrücklichen Zeitbezug beschrieben werden. Ich halte es aber gerade in bezug auf die lebensweltliche Ausrichtung der Gebserschen Bewusstseinsstrukturen für sehr hilfreich, diesen Aspekt zu betonen, weil man durch ihn die gesamte Lebenswirklichkeit auf einmal anspricht. Die verschiedenen Zeitbezüge, an denen wir teilhaben und in denen wir stehen, machen unser gesamtes Leben aus; sie finden nicht im Kopf statt, sondern sie sind wir selbst im Ganzen.

Jean Gebser: Das Integrale Bewusstsein
Jean Gebser: The Integral Consciousness

Original article in German by Kai Hellbusch
English Summary by Reinhard Fuhr

Summary

The Swiss-German philosopher Jean Gebser was probably the first to describe an approaching paradigmatic transformation in the general development of consciousness to an integral world view. The foundation of this phylogenetic and ontogenetic development, from archaic to magic, mythic, mental and integral, is Gebser's concept of consciousness structures. These are given to us as the overall view of ourselves and the world around us in relation to all dimensions of human experience and thinking. These basic structures of consciousness emerge through an evolutionary process, building one upon the other in personal and human history. Whenever one basic structure has become incapable of solving the challenges of life, a new structure is generated. All of these structures have their roots in the timeless, divine origin of everything (*Ursprung*).

Very close to the universal consciousness is the *archaic* structure which is difficult to describe as there is barely any distance between them: humans and the world are identical.

The *magic* structure marks the first step toward a waking human consciousness, introducing a difference from its origin. This is still an ego-less obedience characterized almost exclusively by unreflected *vital experience*. In its deficient form, magic consciousness results in serfdom and in collective trance as in military and many esoteric movements.

The *mythic* structure is characterized by *conscious experiencing:* the soul experiences something. Time becomes conscious and we live in a two-dimensional polarity of the surface expanse. Its deficient form is the inflation of symbolism and an addictive use of tales.

In the *mental* phase of consciousness development thinking is goal oriented and the world is conceived as an object. As the capacity to construct a meaning is developed we start thinking in legal categories, explore space, all of which requires *logical reasoning*. The deficient form of this structure is a dissociation from the unity of experiencing and thinking by overemphasizing mental logic.

The *integral* structure that is newly appearing on the horizon of consciousness development only looks transcendent from the commonly held mental view. At the integral stage all structures are integrated - not only in perceiving the exterior world but also in oneself, which is the reason why this structure is not accepted in science. The world is no longer merely an object. Instead, we establish an intimate relationship between ourselves and the world, which by our perception confirms its very existence. The main challenge of this structure is that consciousness transcends the different tenses by *realizing time* and the fact that we live in continuous timely relations. The integral consciousness is multiperspectival and transcends either-or dichotomies: we become aware of the universal whole which is shining through everything.

Complexity Intelligence and Cultural Coaching:
Navigating the Gap Between Our Societal Challenges and Our Capacities

Jan Inglis and Margaret Steele

Abstract: In this article, we present the term *complexity intelligence* as a useful moniker to describe the reasoning ability, emotional capacity and social cognition necessary to meet the challenges of our prevailing life conditions. We suggest that, as a society and as individuals, we develop *complexity intelligence* as we navigate the gap between our current capacities and the capacities needed to respond to the next stage of complex challenges in our lives. We further suggest that it is possible to stimulate and support the emergence of *complexity intelligence* in a society, but we need a new form of social change agent - a *cultural coach*, to midwife its emergence.

Key words: complexity, reasoning ability, emotional capacity, social cognition, adult development, social change, cultural coach.

Introduction

We are living in complex times and are part of complex systems that our past experiences and training may not have prepared us to understand. In fact, as Kegan (1994/2000) suggests, we may well be “cognitively and emotionally mismatched” to respond to the mental demands of modern life. As we move more fully into a global society, it seems that all our systems are in chaos: our local economies, our health system, the environment, our community life, and often, at times, our own personal lives. We are living in a rapidly changing society. Indeed, as Vaill (1989) suggests, we seem to be living in a state of “permanent white water” and as Toffler (1970) observed nearly 35 years ago, these times are not just like a second Industrial Revolution, but are more like a second great divide in human history – parallel to the movement from barbarism to civilization!

This “great divide in human history,” this monumental shift in life conditions has placed increasing stress on local and global leadership. It is clear that habitual linear thinking is not helping leaders deal with pressing issues such as stimulating the local economy, protecting the aquifer, providing housing choices for our elderly populations or responding to global violence, famine or inequities. Even well-intentioned approaches to governance that include public participation in decision making often fail to grapple with the complexity of issues and end up creating polarized debate and divisiveness. People keep looking for simple approaches to things that are complex.

In using the word *complex,* we are referring to the interconnected and unpredictable nature of issues in a world technologically and thus socially connected across time and space in a way much different than we experienced even 20 years ago. To respond to this complexity, Commons, Danaher-Gilpin, Miller, and Goodheart (2002) suggest that many modern issues require reasoning ability at the metasystematic stage. This stage is broadly similar to Torbert’s (2004) Strategist stage – a stage presently attained by only a small percentage of citizens or

SOME RIGHTS RESERVED

leaders.[1] Clearly, there is a wide gap between the societal challenges facing us in the 21st century and our collective capacities to effectively respond to them. This gap is severely threatening our survival as a species.

As part of the evolutionary process, humans routinely find themselves faced with challenges that exceed their capacities. This is a natural part of growth and evolution and occurs in all realms of the human experience, whether that is physical, mental, emotional, spiritual or interpersonal. But, what happens when the challenges in our life threaten our very deep-seated perception of "how the world works?"[2] In other words, what happens when there is a gap between our operating beliefs of how the world works and the contradictory evidence presented by what we observe in the world around us? What happens to societies when this manifests as large gaps between existing capacities and the capacities needed to respond to societal challenges? In this paper, we suggest that *complexity intelligence* emerges as we make the transition through these gaps. We also suggest that it is possible to actively stimulate and support the emergence of *complexity intelligence* in our society, but we need a new form of social change agent - a *cultural coach*, to midwife its emergence.

Our intent in defining the term *complexity intelligence* is to offer a simple phrase or moniker for practitioners working in the area of social change. We acknowledge the many inspiring individuals and programs in the field of social change and feel that an accessible concept based on rigorous research and contemporary theory is needed to capture the essence of this work. Our concept of complexity intelligence draws on the interrelated fields of adult development, integral theory, transformational learning, complexity theory, dialogue, deliberation and action research. We suggest that social change agents should be familiar with this body of work in designing public processes to support the emergence of complexity intelligence. These theories do not need to be taught conceptually for complexity intelligence to be developed. In fact, in many cases they should not be taught, but rather should be embedded in experiential learning and application. Complexity intelligence is a natural human capacity that will emerge, given the appropriate balance of challenge and support.

The Concept of Complexity Intelligence

Definition of the Term

We consider *complexity intelligence* to be both a capacity and a process. In general terms, it is the capacity to respond to the demands of current life challenges and it is also the process of developing this capacity. To capture its inherent dynamic evolutionary process, we should be using the verb *intelligencing*, but for ease of reference, we are considering both the capacity and the process to be described by the term *complexity intelligence* or, simply, CI.

---

[1] In two samples, Cook-Greuter (2002) reports less than 7% of the adult population in the U.S. and less than 3% of U.S. managers and supervisors operate at this level or higher. In a third sample she reports that 20% of managers and consultants in the U.K. are operating at this level or higher but qualifies this finding by suggesting the higher number is "likely due to self-selection bias" (p. 34).

[2] We are using the phrase "how the world works" to name the habitual lens used to construct, perceive and explain experiences. It has a similar intent to other terms such as: "stage of development" (Wilber, 2001, Beck & Cowan, 1996), "meaning-perspective" (Mezirow, 1991), "meaning-making" (Kegan, 1982/1996), "levels or waves of human existence" (Graves, 1974) etc.

As a capacity, CI is defined to be the integration of the reasoning ability, emotional capacity and social cognition required to function at the level of complexity demanded by current life challenges.

As a process of negotiating transitions, CI includes: (1) recognition that a gap exists between the life conditions currently facing us and our current operating beliefs and assumptions of how the world works (e.g. our practice of enforcing Christmas and Easter as public holidays in areas where large percentages of the population are not Christian); (2) perseverance to stay engaged in the gap with the resulting confusion, contradiction and frustration as we disembed from our familiar operating beliefs; and (3) exposure and openness to a new conceptual framework that helps validate the recognition of this gap.

Complexity Intelligence and Adult Development

In the literature on positive adult development, there are many references and cross-referenced charts describing the various lines, quadrants and domains of human development.[3] In defining CI, we focus on three of these: reasoning ability, emotional capacity and social cognition, or, in other words, reasoning ability in a social context. By describing CI as “reasoning ability in a social context,” we want to make clear that it is not reasoning ability alone (or reasoning ability of the isolated individual alone) that is the crux of complexity intelligence but it is the combination of this ability along with the emotional maturity to access and apply that ability in an interpersonal context. This definition of CI is consistent with Rosenberg’s (2004) reference to the three domains of cognition, emotional orientation and social context and corresponds to Kegan’s (1994/2000) use of the term *knowing.*[4]

A key notion behind the concept of CI is integration. Individuals may have a very high level of reasoning capacity, e.g. operating at the metasystematic or paradigmatic level identified by Commons et al (2002), but if they have not also developed the necessary emotional capacity and social cognition, they will not have the CI needed to operate at the level demanded by prevailing life conditions. This may then show up as a gap between the ability to talk *about* a belief conceptually and the ability to embody it. This can be confusing to others, unless they are willing to look under the content of *what* someone is saying to the structure of *how* they think and accomplish tasks in the world. People are walking around all the time with this type of “integrity gap” and not quite able to see it enough to name it or remediate it. This is a gap of integration - something we can all experience at our growing edge. An integrity gap is often falsely assumed to be an indication of moral corruption, a static judgment that is not helpful, as it does not inquire into the transitional nature of change. Having an integrity gap creates a tendency to feel off centre and a need to hide, avoid, or pretend, making it difficult to be fully present,[5] creative and responsive.

---

[3] Wilber (2000) identifies a minimum of two dozen lines of development in *Integral Psychology*. Kegan (1994/2000) uses three (logical-cognitive, social-cognitive and intrapersonal-affective) and in an interview with Russ Volkmann (http://www.leadcoach.com/newsletter.html#fresh), James Flaherty identifies six streams he uses in his work (cognitive, emotional, relational, somatic, spiritual and integrating).

[4] “This kind of "knowing," this work of the mind, is not about "cognition" alone, if what we mean by cognition is thinking divorced from feeling and social relating. It is about the organizing principle we bring to our thinking and our feelings and our relating to others and our relating to parts of ourselves.” (Kegan, 1994/2000, p.29)

The transition from one understanding of "how the world works" to another is not a smooth linear process, as we know from observing children in their development. We watch them struggle to make meaning of new challenges that exceed their current capacities. For instance, a child is unable to differentiate the letter "d" from the letter "b" in his printing until he has internalized the meaning of the spatial concepts of midline, right and left. As a culture we have anticipated the developmental transitions of childhood and accepted the need for supporting them. This acceptance has allowed us to design learning environments that respect children's different learning capacities.[6] However, we have not yet offered the same consideration to adults in transition. This is probably because, as a culture, we are still embedded in the belief that human development ends with the transition from adolescence to adulthood.

If we assume that once we reach adulthood, development stops, then we are likely to also assume that all adults have the same capacities to integrate their cognitive, emotional and social domains in order to be able to respond to complex situations in a similar and capable manner. This universal "one brush stroke does all" lens could be the root of much of our personal, social and political frustration. It does not let us see the gaps in our own and others' capacities and thus we judge the behaviors as purposeful sabotaging, or permanent incompetencies, instead of respecting them as natural developmental challenges common to us all. That which is invisible to us is not available for conscious intervention. As the literature on positive adult development becomes more widespread in the culture and as we begin to understand the nature of what occurs during transitions, we can hope to see an increase in awareness of the need to support us all in our transitions.

While it is our belief that complexity intelligence is a natural human capacity that appears to have no upward limits, in this paper, we confine our focus to the complexity intelligence required to respond to the dilemmas and transitions currently facing us in the Western World. We see the bulk of the population basically in the transition from Piaget's formal operations to post-formal operations.[7] Of course, the actual transition facing individuals will vary, depending on their life context. Using Torbert's (2004) action-logic terminology, some will be making the transition from Expert to Achiever, some from Achiever to Individualist and others from Individualist to Strategist and beyond. Each transition requires a different set of capacities and anyone working with social change needs to be aware of this difference.

Complexity Intelligence and Societal Development

So far, we have described complexity intelligence as it relates to individuals, but the term can be readily applied to societies as well. It is important to recognize that it is the interaction between the culture and the individual, not just the individual alone that is the locus of social change. Globally we are sitting in the midst of interconnected societies with unresolved problems such as homelessness, AIDs, famine, global warming etc. and the complexity intelligence has not yet emerged to meet these challenges. There is a large gap between these types of societal challenges and our collective capacities to respond to them.

---

[5] The authors consider "being present" a core element of complexity intelligence. It means being able to track the interconnected shifts in emotions, meaning-making and physiological reactions in the moment.

[6] This need has become visible to us although it was not as overtly recognized in childhood education 100 years ago.

[7] Piaget's description of stage change is similar to that described in the transitions from order 3 to order 4 (Kegan, 1982/1996), and the two-step transition from Achiever to Individualist to Strategist (Torbert, 2004), orange to green to yellow (Beck & Cowan, 1996) or abstract to systematic to metasystematic (Commons et al, 2002).

We define a society with complexity intelligence as one that has institutionalized structures in place that support the collective reasoning ability, emotional maturity and "inter-societal"[8] capacity to respond to current societal challenges. If enough of the population of a given society could develop complexity intelligence, they would have the capacity to reason and reflect together and commit to a process of public deliberation or generative dialogue out of which adaptive responses to problems could emerge. Such a society would have the emotional maturity to face the enormity of the global challenges facing it without "numbing out" or splitting into reactive camps. And, it would have the "inter-societal" capacity to truly operate from a worldcentric perspective.

Navigating the Gap

In much of the popular literature on human development, there is a lot of attention given to identifying the stages of development. We want to focus on the space in between these stages. In defining complexity intelligence as a process of negotiating transitions from one stage to the next, we have identified three characteristics of this process: (1) there is a recognition that a gap exists between our operating beliefs and the current conditions facing us; (2) there is the perseverance to stay engaged in the resulting confusion, contradiction and frustration as we disembed from familiar operating beliefs and navigate the gap; and (3) there is exposure and openness to a new conceptual framework that validates our recognition of the gap.

The navigation itself is a natural process. Pushed and pulled by an evolutionary imperative, what Freire (1993) refers to as "the ontological vocation to be more fully human," humans naturally navigate the gap that arises when current operating beliefs no longer make sense of contradictory life conditions. This happens routinely throughout the human lifespan, as illustrated by the following examples. A child initially believes all her attempts at speaking are encouraged, but then realizes that some speaking is considered "swears" and she is punished. An adolescent has to negotiate the transition from a belief that parental routines create comfort and stability to a belief that some parents' routines are also suffocating them. Adults grapple with shifts of meaning from believing their investments in retirement savings plans will support them in their old age through watching investment funds collapse as some of these companies are exposed as fraudulent. They begin to question if security can come from financial investments alone or if the human bonds of a strong community may offer greater protection in old age or debility.

In all these examples, the transition from the old way of understanding "how the world works" to a more complex way of understanding begins with the recognition of a gap. This recognition is supported by the awareness that there is another way of looking at things – i.e. a new conceptual framework. One cannot ignore the contradictions but it takes great perseverance to stay in this place of confusion and frustration until a new way of understanding emerges. Even though the new view eventually "transcends and includes" the earlier view, to use Wilber's (2000) phrase, the transition process is not an easy or simple one.

---

[8] "Inter-societal" is a term used to expand on the interpersonal domain for individuals. Societies also must develop the capacity to deliberate together at a global level to respond to complex global issues.

Often, we may not even recognize that a gap exists. For example, a person who operates from an assumption that social problems are due to those with power oppressing those without power may blame the "system" as it must be perpetuating this imbalance. With this operating belief firmly in place, such a person does not see the history of interconnected social structures that underlie complex issues such as homelessness. Instead, she seeks solutions to problems of human suffering by righting the wrong through "aid to victims." What happens then to a person who holds this belief when, after years of fighting for more shelters for the homeless, she sees those shelters going unused while homeless people still remain sleeping under bridges and on park benches? Perhaps she will continue to hold onto the belief, continuing to blame the system for not providing enough in the form of aid to victims. If the gap between what she believes and what she sees happening is not too great, she may simply ignore it, defend it or make slight adjustments without challenging the assumptions of the familiar lens of "how the world works." She may infer that it is not the view that is limited but she just needs to advocate harder or in a different way to ensure aid to victims. On the other hand, if the gap is large enough that it becomes visible and difficult to live with, the recognition of the gap will ignite the evolutionary imperative and the individual will be forced to deal with the dialectical challenge of resolving contradictory awarenesses. This could lead to a shift in worldview to allow an awareness that effective action requires more from government policy than simply providing "aid to victims." It may also require working with a wide variety of approaches related to housing and health as well as other interconnected systems such as economic development and employment.

In our modern society, we often find ourselves face to face with those who hold different beliefs and values. When we add to this, the confusion and contradictions brought on by rapid changes in technology, we truly do find ourselves in a state of "permanent white water." In such fast moving waters, there is understandable confusion, vulnerability and exhaustion as we feel ourselves losing our footing in our old way of understanding before there is any solid ground emerging to form the foundation of a new comprehension. One of our journal entries describes it this way:

> Part of what I know I need is to be able to process that gap that I am sensing, in order to unfreeze my responses. So I need to sort it, chew on it, make meaning of it, validate my intuitions and then the next time I am much less fumble-minded about it, less reactive and take it less personally. I can then see through the whole matrix of it and respond effectively at the time. It is like a new neurological pathway has been made.[9]

This journal entry illustrates how the reasoning capacity is struggling to make sense of what is occurring, the emotional capacity is stuck in a feeling of "fumble-mindedness" and the social cognition is "frozen" until some integration happens. If the reasoning ability begins to make sense of the situation without integrating the emotional and social aspects, there could be inconsistency between espoused theory and theory in use.

Supporting the Emergence of Complexity Intelligence Through Cultural Coaching

Providing Support to Navigate the Gap

If we are saying that complexity intelligence naturally emerges as an adaptive response to complex conditions, why has it not emerged in response to the undeniably complex conditions of our modern world? Could it be that the gap between our current understanding of how the world works and the challenges we are facing is too big of a gap to navigate? While it is healthy for a challenge to be slightly greater than current capacities as it motivates us to grow, if a challenge is too great, it can overwhelm us and retard our development. If this is our current societal dilemma and if we are, as Kegan suggests "in over our heads," what, if anything, can we do to stimulate the emergence of complexity intelligence to disclose this gap and support the navigation through it? Indeed, can its emergence be stimulated, nurtured and supported? Questions such as these are drawing much interest and attention by theorists and action researchers committed to public issues work. Rosenberg (2004) and Ross (2002) both suggest that designed pedagogical approaches to public processes can lead to an increase in the capacities we are defining as complexity intelligence. These pedagogical approaches can be a way of supporting openness and exposure to new conceptual frameworks.

There must be an appropriate balance between challenge and support. If the challenge is perceived as too great, there needs to be an increase in support to allow growth to occur. How do we provide that support and what form would it take? Could we stimulate the emergence of complexity intelligence with a designed process following what Kegan describes as "life's natural curriculum" offering the right amount of challenge and support?

When individuals experience a gap, they have a variety of sources to turn to for help – personal therapists, life coaches etc., all of which could be called "gap specialists." Many of these professionals specialize in supporting individuals to navigate the gap between formal operational and post-formal operational although they may not formally name their work as such. Through assessment and appropriately designed interventions, these professionals support individuals to adjust to their life situations or co-create more fulfilling circumstances. The shortcoming of this work is that it is done in the privacy of a therapist's office, as if each individual's issues existed separately from their culture.[10] The work of individuation from a specific clients' pathology or "dysfunctional" family could, from a broader lens, often be viewed as the normal evolution from one cultural worldview of how the world works to another one more appropriate for the current situation. For example, is a client's lack of identity and confidence to compete in a highly entrepreneurial market after being laid off, due to an unhealthy relationship with a dominant conservative father who did not allow much self-expression? Possibly, as of course all individuals must become conscious of their own path and influences. At the same time, however, this client is also an example of a culture struggling with a shift in worldview from one that values loyalty to tradition, morality and group standards to one that values personal initiative, practical efficiency and change.

For many individuals, personal therapy has been a great source for improving individual capacities for personal awareness, emotional bonding, sense of belonging, authentic expression, adequate body-mind integration to stay present and the ability to understand and empathize with others who are different. These capacities are essential conditions for complexity intelligence to emerge and for engaging effectively in public processes. However, personal therapy, working as it does mainly at the level of the individual or family, cannot, by itself, effect social change. This is because the locus of change must include the culture.

---

[10] The book entitled *We've had a hundred years of psychotherapy and the world's getting worse* by Hillman and Ventura (1992) challenges the hope that has been held that individual transformation would have been enough to change the world.

Coaching Societies Through the Gap

Clearly, there are plenty of resources for an individual in distress to access. But where does a society or a culture turn when it needs "therapy?" There is a need for a body of practitioners who can, as Kegan says "throw a sympathetic arm of disciplined friendliness across the burdened shoulders of contemporary culture."[11] Such practitioners, we are calling *cultural coaches* - change agents who support the transformation of dysfunctional societal issues. This is not easy work and requires deep commitment, personal maturity and a thorough understanding of adult development, social systems and the process of public deliberation and dialogue. Individuals interested in cultural coaching should participate in a developmental learning process that is designed to stimulate the large perspective and capacities needed to meet complex 21st century issues. Well-trained, experienced cultural coaches would create carefully designed processes with the right mix of challenge and support to encourage public awareness, inquiry and reflection. Over time, a cadre of cultural coaches could stimulate and support the culture to evolve to the next stage in its development. This work needs to be approached with deep integrity. Personal therapists are aware of the power they hold in relationship with their clients. Their capacities are built and evaluated based on principles and professional codes of ethics. This must also apply if one is to be a coach of cultural transformation with the acknowledgement that this is life work with no endpoint in the learning/evolving process.

In our culture, the locus of change has been identified very much with the individual and it needs to shift to include both the individual and the culture and the relationship between them. By supporting the emergence of complexity intelligence in individuals, we are supporting the evolvement of the organizations and communities where they work and live. Of equal, if not more importance, by supporting complexity intelligence of the culture we are also supporting the evolvement of individuals, as the culture is the holding environment for development.

We have defined a society with complexity intelligence as one that has institutionalized structures that support the collective reasoning ability, emotional maturity and "inter-societal" capacity to respond to existing complex societal challenges. A society with complexity intelligence as its centre of gravity has social infrastructures in place that develop and support the collective capacity to reason and reflect together; to be emotionally responsible in facing the enormity of our local and global challenges without splitting into reactive camps; and to truly operate from a worldcentric perspective.

How do we support the emergence of complexity intelligence in our culture and how do we institutionalize it in our society? First, as one approach, we suggest that cultural coaching must become institutionalized as a recognized profession, just as personal coaching and personal therapy have become recognized professions in the individual domain. Secondly, we suggest that processes intended to support the emergence of complexity intelligence must be well designed. Too often, we expect that simply by gathering people in one room to talk about some complex issue that these collective capacities for dealing with the task at hand will just appear.

---

[11] Kegan (1994/2000, p. 3)

The Importance of Designed Processes

Our concept of complexity intelligence draws on the interrelated fields of adult development, integral theory, transformational learning, complexity theory, dialogue, deliberation and action research and inquiry. In designing public interventions, cultural coaches would draw on their knowledge of this theoretical framework. For example, program design can be informed by complexity theory. Public processes can be designed to support the process of self-organizing inherent in complex adaptive systems. Eoyang and Olsen (2001) suggest there are three conditions which, in their interrelationship, influence a system to self-organize: (1) creating a container i.e. the intent and support for dialogue and deliberation; (2) surfacing diversity and differences which allows creativity to flow; and (3) increasing the frequency of transforming exchanges so feedback loops can reveal the consequences of our choices and also inform us as to who “we” are.

In our opinion, the design of public processes should also be informed by recent work by Torbert (2004), Ross (2002) and Rosenberg (2004). Torbert’s approach to action inquiry provides an effective structure for aligning outward effectiveness with inner integrity in real time by increasing awareness of our inner process, building mutuality through how we speak to others and developing sustainability through how we organize. Ross (2002) has done extensive work in designing a developmental approach to complex public issues based on a framework of deliberative democracy, integral theory, human development, transformation theory, timely action inquiry and consciousness studies. In a recent paper on public deliberation,[12] Rosenberg advocates for public processes that develop the “cognitive capacities, emotional orientation and social context” for democratic deliberation.

If attempts to bring citizens together to grapple with complex social issues are not designed to consider the diverse worldviews, capacities and complexities, the best in people will not be brought forward, and participatory projects will flounder, leaving people frustrated and eventually apathetic. Rosenberg indicates that most citizens do not have the capacity to engage in deliberative democracy as they lack many of the cognitive, emotional and communicative capacities to participate effectively in this work:

> A good deal of research on small group behavior and communications provides evidence of people’s evident inability to understand and fairly consider other people’s perspectives, to think critically about their own position or the social conventions to which they adhere, or think about problems creatively and generate novel alternatives.[13]

Rosenberg also suggests many citizens lack the ability for empathy and bonding with their community to allow for the commitment required for deliberative democracy. If adults differ in these essential components of complexity intelligence then there is a lack of autonomy and equality, necessary ingredients according to Rosenberg for democracy. As the complexities of our public issues increase, we will have to address the fact that we need to develop complexity intelligence to respond, understand and engage with these issues and with each other.

---

[12] Rosenberg (2004).

[13] Rosenberg (2004, p. 4)

Concluding Remarks and Suggestions for Ongoing Inquiry

In concluding this paper, we want to emphasize that human beings and societies are naturally adaptable. With the right combination of challenges and support, they will naturally evolve the capacities to meet the demands of existential conditions. However, in times of rapid change and in the absence of adequate support, large gaps can occur between the capacities needed to respond to life's demands and the actual capacities that have developed. Such is the case today where we seem to be living, as Vaill (1989) suggests, in a state of "permanent white water" and there is a large gap between the capacities needed to respond to our societal challenges and the capacities we have developed.

In this paper, we present the idea of *complexity intelligence* as a useful concept to frame our current global situation and our efforts to remediate it. We define complexity intelligence as the capacity to respond to the demands of life challenges and also the process of developing this capacity. In individuals, we consider complexity intelligence to be the integrated reasoning ability, emotional maturity and social cognition necessary to meet the demands of life. We define a society with complexity intelligence as one that has institutionalized structures in place that support the collective reasoning ability, emotional maturity and inter-societal capacity to respond to existing complex societal challenges. We suggest that complexity intelligence emerges as we navigate the transition from one set of operating beliefs about how the world works to a more expanded set of operating beliefs transcending and including the former. This process begins with the recognition of a gap between our beliefs of how the world works and the life conditions we observe around us. Perseverance is required to stay engaged in this gap along with the resulting confusion, contradiction and frustration as we disembed from our familiar beliefs. Also, there must be exposure to a new conceptual framework that helps validate the recognition that a gap exists.

We believe it is possible and, indeed, necessary, to stimulate the emergence of complexity intelligence in society, but we believe a new form of social change agent is needed to midwife its emergence. We call this new change agent a *cultural coach* and recognize this work requires deep commitment, personal maturity and a thorough understanding of the parameters of social change. Well-trained and experienced cultural coaches could design processes of public dialogue and deliberation that would support the transformation of dysfunctional societal issues. Over time, a cadre of cultural coaches could stimulate and support the culture to evolve to the next stage in its development. For social change to be lasting, we believe that it is imperative that cultural coaching becomes institutionalized as a recognized profession, just as personal coaching and personal therapy have become recognized professions in the individual domain.

Questions for On-going Inquiry

There are several big questions threaded through this article. Some partial answers have been posited and yet many questions remain. How prevalent is the awareness that there is a gap between the challenges facing us as global citizens and our capacities to respond to them? If we are aware of the gap, how willing are we to stay engaged with the resulting confusion, contradiction and frustration to allow complexity intelligence to emerge? Do we have enough time? In fact, the largest question of all may well be will we, as a species, continue to evolve in a healthy adaptive manner? What are the conditions that will support that evolvement? How will we know whether an adaptation is advantageous or not? Will there be a threshold or limit to the amount and speed of complexity that we are experiencing as some suggest? Can posing and pondering these questions be done with vitality and inspiration? We look forward to continuing this exploration and invite comments and feedback on this article.

The Development of Dialectical Thinking As An Approach to Integration

Michael Basseches

Abstract: This article offers a description of dialectical thinking as a psychological phenomenon that reflects adult intellectual development. While relating this psychological phenomenon to the various dialectical philosophical perspectives from which the description is derived, the article conceptualizes dialectical thinking as a form of organization of thought, various aspects of which can be identified in individual adults' approaches to conceptualizing a range of problems, rather than as one particular stream of intellectual history. The article provides a range of examples of dialectical analyses, contrasting them with more formalistic analyses, in order to convey the power, adequacy, and significance of dialectical thinking for the sorts of challenges that this journal embraces. It suggests that events in all areas of life demand recognition of the limitations of closed-system approaches to analysis. Approaches based instead on the organizing principle of dialectic integrate dimensions of contradiction, change and system-transformation over time in a way that supports people's adaptation when structures under girding their sense of self/world coherence are challenged. Higher education and psychotherapy are considered as examples of potential contexts for adult intellectual development, and the conditions that foster such development in these contexts are discussed. The article as a whole makes the case for consciously attempting to foster such development in all our work as an approach to integration.

Key words: dialectic, development, transformation, constitutive relationships, interaction, multiple systems, open systems, metasystematic, epistemic adequacy, dialectical thinking, dialectical philosophical perspective, dialectical analysis, psychotherapy, higher education

Introduction

In this article, I present a description of what I have called dialectical thinking that was first written two decades ago.[1] My goal is to present it in a way that suggests its power, adequacy, and significance for the challenges that this journal is dedicated to embracing. I refer the reader to other work (Basseches, 1978, 1980, 1984, 1989) for a full exposition of the philosophical argument, the research methodology for recognizing elements and examples of dialectical

---

[1] Editor's note: See the author's discussion beginning on p. 49 that describes his use of the term dialectical thinking as psychological phenomenon.

O'Connor (Eds.), *Thinking, Reasoning, and Writing* © 1989 by Longman Inc. Reproduced with permission of Greenwood Publishing Group, Inc., Westport, CT. www.greenwood.com.

SOME RIGHTS RESERVED

thinking and assessing individuals' capacity for dialectical thought, and the empirical findings, all of which support my claim that dialectical thinking reflects adult intellectual *development.* Pending examination of that work, I invite the reader to critically evaluate the philosophical position reflected in this article. For readers who cannot embrace this philosophical position, it may be more appropriate to use my description as a diagnostic tool for recognizing dialectical thinking in the thinking of others, than as defining a goal to pursue. However, this article is offered to all theorists, researchers, and practitioners who share the goal of fostering integrative thinking, and as a plausible account of the sort of intellectual development that all our work ought to promote.

Power, Significance, And Adequacy

Let me begin by offering a couple of scenarios of situations in adult life in which dialectical cognitive organization would make a difference in how meaning is made of phenomena. I hope these examples will provide an initial feel for what I include within the scope of dialectical thinking, as well as its implications. In each example, I will start with two non-dialectical, but not unusual, ways of thinking about the problem at hand, and then contrast them with a third, dialectical alternative.

Mary, Helen, and Judy are all mothers of daughters. Each mother has held a set of values that have guided her efforts to raise her daughter. Now, the daughters have grown up and each of them is rejecting many of her mother's values.

Mary is very troubled. She sees only two possible interpretations. If her values are right, she has failed as a parent in not having successfully transmitted those values to her daughter. On the other hand, if her daughter's values are right, the whole foundation of the way Mary has lived her life is wrong, and Mary neither deserves nor is likely to receive her daughter's respect.

Helen, however, is shrugging the matter off. She reasons that values are totally arbitrary and irrational anyway. All people have their own values and live their lives by them, and who's to say which ones are right and which ones are wrong. The important thing is to respect others, even if they have different values. Helen respects her daughter in spite of their differences.

Judy begins to think about the matter by looking at the evolution of values in historical perspective. She reasons that human values change over the course of history as old values interact with changing environmental circumstances. People need values in order to decide how to act, but in acting according to their values they change the world, and the changed world in turn leads to the development of new values. Judy understands her daughter's values as resulting from the interaction of the values Judy tried to share with her and the experiences of the world that her daughter has had but Judy herself never had. Judy says to herself,

> Instead of assuming either that I am wrong or that my daughter is wrong, I can try to see what I can learn for my future life from her values borne of her experience. I can also see how she has learned from my values and transformed them to keep up with the times.

Mark, Howard, and George are college juniors. They are feeling very frustrated about three years of the routine of tests, paper assignments, and grades. They worry that going through this process has taken its toll, undermining their love of learning.

Mark is confused. Based on his own experience, it seems to him that students would learn much more if they were given more freedom to pursue their own intellectual interests, rather than being required to take standardized tests and complete standardized assignments. On the other hand, he assumes that the college is run by experienced educators, who must have determined that the use of tests and assigned papers to measure and grades to motivate is the soundest educational method.

Howard is angry. He locates the cause of his own demoralization and that of his fellow students in teachers' illegitimate presumption that they can pass judgment on students' ideas. He believes that much of grading is subjective and that teachers use their power to impose their own personal tastes on what students think and how students write. Although Howard doesn't accept it as educationally legitimate for teachers to dictate what students should learn and then to evaluate them by subjective standards, he does accept that that's the way the system works. He has decided that he wants to make it through the system, and has cynically dedicated himself to cultivating the art of giving teachers what they want.

George begins to analyze the problem by locating the college within the larger society of which it is a part. The college is expected to perform a certification function for that society, providing transcripts that other social institutions can use in their selection processes. But the college is also expected to provide students with a good education. The problem that he and Howard and Mark are experiencing reflects a contradiction between the certificational and educational functions of the college. The need to provide certification (grades) to the outside leads the college and its faculty to employ practices that may not be educationally optimal (i.e., standardized assignments). Similarly, the concerns with providing a good education leads to practices that may not be certificationally optimal (i.e., grading students on subject matter where completely objective evaluation is impossible). George reasons that this contradiction will only really be resolved when the basic relationship of the colleges and universities to society is transformed. He decides that he will devote his time at college to trying to learn all he can that might help him contribute to that kind of transformation of educational institutions. He accepts that in the meantime he will be given standardized assignments and grades and will have to make compromises just as his teachers do between what is educationally and certification ally optimal. But he is resolved not to lose sight of his own educational goals.

In my view, the example of “dialectical thinking” in each of the above cases reflects a power, significance and adequacy that is not present in the non-dialectical alternatives. I will consider the nature and bases of this adequacy in later sections of this article. However, first, I will discuss the sources of my conception of dialectical thinking.

My understanding of dialectical thinking as a psychological phenomenon is derived from a conception of a dialectical philosophical perspective. I will now describe this philosophical perspective in a way that indicates its underlying unity. In doing so, I will take the liberty of casting a net that in some ways may be broader and in other ways narrower than those nets intellectual historians might cast. My net may be broader in that I am grouping ideas and ways of thinking under the heading "the dialectical philosophical perspective" based merely on their philosophical and psychological similarities rather than establishing a "tradition" by demonstrating actual historical connections among ideas and thinkers. My net may be narrower in that I do not try to hold within it the various pre-Hegelian forms of thought that were called dialectical, whereas intellectual historians might advance accounts of the continuity between pre-Hegelian and post-Hegelian uses of the term.

The Dialectical Philosophical Perspective

I view the dialectical perspective as comprising a family of world outlooks, or views of the nature of existence (ontology) and knowledge (epistemology). These world outlooks, while differing from each other in many respects, share a family resemblance based on three features: common emphases on change, on wholeness, and on internal relations.

Dialectical ontologies emphasize (1) that what is most fundamental in reality are some ongoing processes of change; (2) that in the course of these ongoing processes of change within existence as a whole, forms of organization emerge that have a coherence that cannot simply be accounted for by the nature of the parts that are organized within these forms (the forms are temporary and may disintegrate or give way to more complex forms of organization); (3) that everything that exists is in relationship to other things and that these relationships are internal to the nature of the things themselves-they are part of what makes the things what they are (and as a thing's internal relations change, its nature changes) .

Similarly, dialectical epistemologies emphasize (1) that both individual and collective knowledge are essentially active processes of organizing and reorganizing understandings of phenomena; (2) that in these knowing processes there emerge individual and collective conceptual systems that give the knowledge a coherence that cannot simply be accounted for by the specific concepts, ideas, and facts organized within them; (3) that concepts, ideas, and fact exist in relationships not only to other concepts, ideas, and facts but also to the lives of the knowers who employ them. These relationships determine the meaning of the concepts, ideas, and facts, and as these relationships change, the meanings of concepts, ideas, and facts also change.

What ties together the emphases on change, wholeness, and internal relations in dialectical world outlooks is the concept of dialectic. This concept underlies both dialectical world outlooks and the particular approaches to analysis that constitute dialectical thinking.

The Idea of Dialectic

Dialectic is *developmental transformation (i. e., developmental movement through forms) that occurs via constitutive and interactive relationships.* The phrase "movement through forms" is meant to distinguish such movement from movement within forms. To illustrate this distinction, consider what happens when a road is built from one city to another. The road has a certain form to it, and the form of that road regulates the movement of the vehicles traveling between those cities. Thus, we may take this movement of the vehicles as movement within forms. On the other hand, the movement or change associated with the decay of the road, the emergence of trouble spots in terms of accidents or traffic jams, and the process of building a new and better road with a different form to replace or supplement the old road can be seen as a movement through forms. Through the notion of movement through forms, or “transformation” the definition of dialectic relies upon and presupposes both the notion of movement and the notion of form and focuses on a particular relationship between them. Describing this movement through forms or transformation as developmental implies that there is a certain direction to it. This direction is usually associated with increasing inclusiveness, differentiation, and integration.

The definition relates this developmental transformational movement to constitutive and interactive relationships. A relationship may be understood as a connection. Although a relationship is often thought of as a connection between things, where the things are taken to exist prior to the relationship, the phrase "constitutive relationship" is meant to indicate the opposite-the relationship has a role in making the parties to the relationship what they are (cf., “internal relations,” above). The adjective "interactive" implies that a relationship is not static but is characterized by motion or action of the parties upon each other.

Our example of the road will also serve to illustrate the concepts of constitutive and interactive relationships. Constitutive and interactive relationships can be identified among the builders of the road, the road itself, and the users of the road and their vehicles. The road is constituted not only by its interaction with road-builders (who build it) but also by its relationship with the vehicles that travel on it. For if no vehicles were permitted to travel on it, it would no longer be a road. It would perhaps be a road that had been converted to a mall. Or if only airplanes traveled on it, it would be a runway rather than a road. Thus, its being a road depends on its particular relationship to vehicles. Likewise, it is clearly relationships with roads that make road-builders road-builders. It is also, though perhaps less obviously, relationships with roads that make vehicles vehicles. Vehicles are vehicles because they have the capacity to transport one someplace, and the extent to which they have this capacity is dependent on the extent to which suitable thoroughfares exist.

The relationship between the vehicles and the road is interactive, as well as constitutive, in that the vehicles change the road and the road changes the vehicles. This should be clear from the previous discussion of road decay or wear (vehicles changing the road) and of developing trouble spots on the road that cause accidents to the vehicles (the road thus changing vehicles).

Once again, as was mentioned earlier, this interaction between road and vehicles leads to the transformation of the whole situation described earlier in terms of the building of a *new* road. This is the sense in which the transformation occurs via constitutive and interactive relationships. Thus the movement whereby a new road is built as a result of the interactive and constitutive relationships among the previous road, the road-users and their vehicles, and the road-builders, may be seen as an instance of dialectic.

Dialectical Thinking and Dialectical Analyses

Dialectical ontologies view existence as fundamentally a process of dialectic. Dialectical epistemologies view knowledge as a process of dialectic. Because dialectical thinking derives from a general world outlook, individual dialectical thinkers are likely to view both existence and knowledge dialectically. But it is possible to hold a dialectical view of one realm and not the other or to view neither realm as a whole in a fundamentally dialectical way but to think dialectically about particular phenomena. Most generally, we can say that dialectical thinking is any thinking that looks for and recognizes instances of dialectic and that reflects this orientation in the way in which it engages inquiry. Orienting toward dialectic leads the thinker to describe changes as dialectical movement (i.e., as movement that is developmental movement through forms occurring via constitutive and interactive relationships) and to describe relationships as dialectical relationships (i.e., as relationships that are constitutive, interactive, and that lead to or involve developmental transformation).

Formal operational thinking as described by Piaget can be understood as efforts at comprehension that rely on the application of a model of a closed system of lawful relationships to the phenomenal world. In contrast, dialectical thinking can be understood as consisting of efforts at comprehension relying on the application of a model of dialectic to the phenomenal world. These latter efforts may be termed dialectical analyses, in contrast to formal analyses. I am suggesting that dialectical thinking is an organized approach to analyzing and making sense of the world one experiences that differs fundamentally from formal analysis. Whereas the latter involves the effort to find fundamental fixed realities – basic elements and immutable laws – the former attempts to describe fundamental processes of change and the dynamic relationships through which this change occurs.

Dialectical analyses can be found in the history of a wide range of intellectual disciplines, representing the natural sciences (Provine; Feyerabend; Horz et at), social sciences (Jay; Kilminster; Mandel) and humanities (Jameson; Adorno and Horkheimer). They have been used to support political stances ranging from the very conservative (Hegel) to the revolutionary (Marx and Engels). To illustrate the role of such analyses in intellectual history, I will consider briefly aspects of the dialectical analyses found in the work of Karl Marx and Thomas Kuhn. Then I will discuss dialectical analyses in day-to-day life.

Marx (1967) started with the observation that people collectively interact with nature so as to produce what they need to perpetuate themselves. He referred to this process as labor. In any particular society, this productive and reproductive activity takes a particular form (mode of production) and is characterized by a particular structure of social relations (relations of production) among the participants. Marx analyzed the history of production as a dialectical process in which many aspects of economic, social, technical, and intellectual life are all interrelated within a form of organization inherent in the existing mode and social relations of production. Tensions develop within these interrelationships as the form of productive life continues over time until eventually these tensions lead to the creation of a whole new mode of production that replaces the previous one. Marx described the replacement of feudal society with capitalist society as an instance of this kind of dialectical transformation and predicted the replacement of capitalism with communism

Kuhn's book, *The Structure of Scientific Revolution*, provided a dialectical analysis of the history of science. He argued that within a scientific discipline, research is shaped by what he called a *paradigm.* A paradigm binds together implicit assumptions about the phenomena being studied with assumptions about the methodology appropriate for studying those phenomena and with methods of defining problems and recognizing solutions. However, a paradigm at its root is a particular piece of research yielding a particular insight, which serves as a model for other researchers. According to Kuhn, research following a paradigm tends to produce anomalies—findings that are not easily reconciled with other knowledge in the field. When enough such anomalies are produced to make scientists within the field uncomfortable, new alternative paradigms are advanced that compete with the dominant paradigm for followers. A scientific revolution has occurred when a new more comprehensive paradigm, with a new set of assumptions, a new methodology, and a new way of defining what constitutes a research problem and what constitutes a solution attracts enough followers to become dominant and to define the nature of the field.

In the cases of Marx and Kuhn, dialectical analyses were presented as alternatives to formal analyses in classical economic theory and philosophy of science, respectively. These formal analyses assumed that a single set of fundamental laws of economic behavior in one case and fundamental rules of evidence for scientific hypotheses in the other case were universally applicable. Neither the constitution of the economic laws by the existing social relations of production nor the possibility of transformation to new modes of production in which economic behavior was different was recognized by classical economic theory (Smith). Similarly, neither the constitution of rules of evidence by paradigms currently popular within scientific communities nor the possibility of reorientation of sciences to paradigms with new rules of evidence was recognized by confirmationist (Reichenbach) or falsificationist (Popper) philosophies of science.

We can find many examples of problems of adult life that, like scientific problems, may be approached in relatively formalistic or relatively dialectical ways, with differing outcomes. Consider, for example, the choice of a marriage partner. If I were to adopt a formalistic approach to analysis I might start with the assumptions that I am who I am and that there are one or more people out there who are "right" for me. I might proceed to analyze my personality traits and to try to logically deduce the traits a partner should have to be compatible. Courtship would then consist of evaluating potential partners to see if they have the desired traits and testing my hypotheses about the traits required for compatibility. Notice that the formalistic approach begins with the assumption that people have fixed traits and that the goodness of a relationship is systematically determined by a matching of traits.

A dialectical approach might begin with the assumption that my traits are not fixed and that the relationships I enter will shape who I become as much as they are shaped by who I am and who my partner is. Here, courtship would involve entering relationships with potential partners, being open to being changed by relationships. We would then need to evaluate whether the relationship is evolving in ways that allow both of us to develop as individuals while it continues to develop as a relationship.

The alternatives of formal analysis and dialectical analysis may also be applied when a relationship breaks up. If I adopt a formal approach, I might try to explain to myself why the relationship ended by choosing among the following three interpretations.

a. I was inadequate as a partner.
b. My partner was inadequate as a partner.
c. We weren't really right for each other, and we made a big mistake in choosing each other.

If I adopt explanation (a), the result is likely to be an increase in pain resulting from lowered self-esteem. If I adopt explanation (b), the result is likely to be a great deal of anger at my partner, which, among other things, will make it much harder for us to get back together in any sense. If I adopt explanation (c), the result is likely to be my devaluing a great deal of what was beautiful and valuable in our relationship for as long as it lasted, as well as possible hesitancy to make future commitments. I may say, "If I thought this person was right for me and I was wrong, it means I can't trust my own judgment."

In contrast, if I take a dialectical approach to analyzing the break-up, I am likely to look for how experience both within and outside of the relationship has led us to grow in different directions, so much so that we would be hampered by remaining so tied to each other. The assumption is that a relationship can reach a point where it tends to interfere with the development of one or both of the partners rather than helping them to grow further and growing with them. This kind of analysis is likely to make it easier, rather than harder, to deal emotionally with the breakup. It also is likely to facilitate our working together to strengthen or rebuild the relationship. If we don't blame each other and don't treat the relationship as a mistake, but instead treat the occurrence as a natural function of human development, we are more likely to ask, "How does the relationship need to change in response to the changes it has brought about in us in order for it to continue?" If we do this, a developmental transformation of the relationship rather than its continued disintegration is more likely to occur.

Another example of the difference between formalistic and dialectical approaches may be found in the analysis of value differences between parents and their children with which I introduced this paper. There a formal analysis (Mary's) led to a choice between viewing oneself as having failed as a parent or as unworthy of one's daughter's respect. The dialectical analysis (Judy's) viewed the problem in the context of a dynamic approach to the evolution of values. Similarly, in the example of frustrated college students, the formal analysis (Mark's) assumed that problems in the college's procedures derived from an educational theory. This analysis led to the two choices of either rejecting the wisdom of one's teachers or discounting one's own perceptions as incorrect. The dialectical analysis (George's) interpreted the problems as reflecting tensions in the interrelationship of various aspects of the institution's functions and led to a recognition of problems facing teachers and students alike, as well as of potentials for the institution to be transformed.[2]

In each case, a dialectical analysis does not preclude a formal analysis. We may believe that relationships change and that people change and still ask questions about what makes partners compatible and how individuals can learn to be better partners. We may believe that values change over time and still ask ourselves if our daughter's view or our own view is more adequate on any particular value disagreement. We may trace problematic procedures at a college to fundamental contradictions among its functions and still inquire as to the educational impact of those procedures.

However, the capacity for dialectical analysis makes it possible both to see the limits and to see beyond the limits of the context in which we apply formal analysis. For example, in the matter of finding a marriage partner, I may hypothesize that I am a serious person and would have trouble getting along with someone who was not equally serious. But a dialectical perspective would prepare me for the possibility that in getting to know a very playful new friend I may reverse my thinking about compatibility and find I get along better with someone who can help me to laugh and play. I may even transform my prior assumptions about myself and find, that I am a fun-loving person. I might then either (1) look back at my prior seriousness as simply an emotional defense and understand the interpretation of myself as serious as itself a useful product of the historical moment, or I might say (2) "No, I really was a serious person then and now I am a fun-loving one." While (1) reflects a dialectical *epistemological* perspective on the evolution of self-knowledge over time through interaction, (2) reflects a dialectical *ontological* perspective on the evolution of personality through interaction.

In *each* of the cases discussed above, I think the dialectical analysis has a power that is absent in the formal analysis. At the same time, the dialectical analysis can make use of the power provided by the formal analysis. Marxian economic theory may make use of the classical economic theory's clarification of the laws of human economic behavior under capitalism but also analyze the potential and actual transformations of those laws. Kuhnian analysis can make use of philosophical clarification of the rules of evidence employed within the paradigm that dominates a discipline, while simultaneously analyzing historically how that paradigm achieved hegemony and where it is likely to confront its limits.

---

[2] While the focus in this section is the contrast between formal and dialectical analyses, Helen and Howard’s thinking in these examples represent a “relativistic” alternative to both. Relativistic approaches often avoid the constraints that formal analyses impose, but they do so at the expense of eschewing the possibilities for integration that are present in dialectical analyses. While the discussion of the relativist alternative is beyond the scope of this analysis, see Basseches, 1984 for a fuller analysis of its structure, strengths and weaknesses.

As stated above, dialectical analyses of courtship, break-ups, intergenerational value disagreements, and frustrations of college do not preclude formal analyses. But with respect to social reasoning it is important to note that in each case dialectical analyses provide alternatives to views of the problem that are destructive to self or others. In one of the examples, the mother's formalistic analysis leaves her with two emotionally self-destructive alternatives. The dialectical analysis provides an alternative that affirms the self within the context of historical change. In other cases, the constraints of formal analysis are oppressive to other people. The "formalistic" approach to courtship, which attempts to evaluate the traits of potential partners, may be experienced by a potential partner as a barrier to emotional closeness as well as to the partner's influence. The "dialectical" approach, which anticipates the possibility of development resulting from interaction with partners, is, in contrast, likely to be experienced as a warm invitation to interact.

In general, formal analyses that establish categories of analysis from the thinker's own perspective tend to remain relatively impermeable to the differing perspectives of others.[3] Dialectical thinking, in contrast, is actively oriented toward shifting categories of analysis and creating more inclusive categories, in response to the perspectives of others.

Costs of Dialectical Approaches

I do not want to present dialectical thinking as either an intellectual or psychological panacea. Dialectical analyses are not without costs. The willingness to question the permanence and intransigence of the boundary conditions of a problem and to ask about situations that lie beyond those boundaries characterizes each of the dialectical analyses cited above. In one case, the boundaries were the capitalist form of production; in another, existing paradigms; in a third, existing conceptions of one's own personality; in a fourth, the social conditions in which one's moral principles were formed; and in a fifth, the assumption that educational practice follows from educational theory. In questioning these boundaries, we may be questioning precisely those points of reference that provide us with a sense of intellectual stability and coherence about our world.

To think dialectically, is, in a certain sense, to trade off a degree of intellectual security for a freedom from intellectually imposing limitations on oneself or other people. The open-mindedness thus gained is extremely important from the perspective of a concern with sociocognitive development because it facilitates the joining in collective meaning-making efforts with others whose reasoning is shaped by very different world-views or life-contexts. However, if our concern were only with individual psychological well-being, and not with sociocognitive development, we might not be so quick to advocate this tradeoff. It might well depend on the likelihood of the individual being able to organize life in such a way as to avoid encountering events that shatter particular sources of intellectual security.

---

[3] This problem is analogous to an oft-discussed problem of social research. When researchers deal with data by sorting subjects' responses into categories predetermined by the researchers, this excludes the possibility of the subjects contributing from their own perspectives to the definition of the problem and the shape of the results.

We face sources of limitations other than intellectual ones, and other sources of pain as well. In the example of the relationship breaking up, loss of the reassuring presence of someone one loves and whom one may have expected to spend one's life with is painful, usually excruciating, no matter how one thinks about it. Dialectical thinking cannot free one from that pain. However, the kind of formalistic analysis of the break-up that I presented before intellectually reinforces the pain. It adds to the pain of loss the self-punitive pain of failure or inadequate judgment or the divisive pain of blame and hatred. The dialectical analysis is more likely to allow one to experience the pain as loss and to mourn the loss. At the same time the pain of loss may be counterbalanced by an emotionally positive intellectual awareness of (1) order in the developmental process, (2) new discovery, and (3) the opening of new possibilities.

In the case of the Marxian analysis presented above, if one is embedded in the midst of a capitalist economy, whether as a government economic advisor or as an individual laborer and consumer, it may seem far more worthwhile to spend one's time analyzing the laws of that economy formalistically than analyzing how it got to be that way, how it maintains itself, and where it could be going, dialectically. Granted, not being able to imagine what living under different laws of economic behavior would be like is a limitation; but needing to live among other people, all operating according to the current laws, poses a more serious limitation. Again, if we were arguing solely about individual welfare, the tradeoff between analyses that help one make predictions given boundary conditions that are unlikely to change in the near future and analyses that might help one to change or prepare for change in those conditions would be tough to evaluate. But from the point of view of humanity, as a socioepistemic subject, involved in an ongoing pursuit of truth, the added power made possible by the capacity for dialectical analyses seems important to recognize. While recognizing the importance of seriously addressing the question, “Who has time for what kind of dialectical analyses, and when,” I do want to claim that dialectical thinking is an important phenomenon of adult sociocognitive development.

To review, the following general characteristics of dialectical thinking have been cited above.

1. Dialectical thinking is thinking that looks for and recognizes instances of dialectic-developmental transformation occurring via constitutive and interactive relationships.
2. Dialectical thinking is philosophically rooted in a family of world outlooks in which knowledge and existence are viewed as essentially dialectical processes and in which change, wholeness, and internal relations are emphasized.
3. Dialectical analyses draw attention to the limits of the contexts in which formal analyses are applicable.
4. As a result, dialectical analyses have a power to deal with relationships and transformations beyond the boundary conditions of a formal analysis, while still making use of the power of the formal analysis within those boundaries.
5. Dialectical approaches are more permeable than formalistic approaches to the perspectives of other people who may define a problem in fundamentally different ways.

Dialectic as an Organizing Principle

The organizing principle for formal operational thought is the structured whole, or system. In contrast, the organizing principle for dialectical thinking is the dialectic. If we equate the notion of form in the definition of dialectic with that of structured whole or system we see how the concept of dialectic builds upon, but is more complex than, the concept of system. Dialectic refers to the developmental transformation of systems over time, via constitutive and interactive relationships.

Thus, whereas formal thinking is systematic, dialectical thinking is metasystematic. In formal operational thought, an underlying (closed) system organizes a *logic of propositions* into a coherent whole. It enables the thinker to deal systematically with various propositions and their necessary interrelationships. It also makes possible the analysis of phenomena that can be effectively modeled as comprising closed systems. But the closed-system model is not adequate for problems requiring analysis of (1) multiple systems and their relationships to each other, or (2) open systems that undergo radical transformation.

In contrast, in dialectical thinking, an underlying model of dialectic organizes a *logic of systems* into a coherent whole. It enables the thinker to deal with various systems and their relationships to each other over time dialectically. The model of dialectic does provide a basis for analysis of (1) multiple systems and their relationships to each other, as well as (2) open systems that undergo radical transformation.

In dialectical thinking, what it is that remains recognizable across a range of changes is the historical process as an evolving whole. Any change at all, no matter how radical, can be equilibrated if it can be conceptualized as a moment in a dialectical process of evolution. New events are integrated within a dialectical conception of a process as later steps in the evolution of that process; old constructions are conserved- they remain part of the process of dialectic- although their historical role is reconstructed in the light of subsequent transformations.

For example, consider this dialectical analysis of sex roles. Systematic regularities have existed throughout history in male and female sex roles. In each era, the description of regularities in male and female sex roles has led to abstractions about how women's nature and temperament is on the whole different from men's. As a result of a range of changes in society (e.g., overpopulation), phenomena began to occur more regularly that were discrepant with traditional sex roles. The abstract models, as well as social norms and laws that are based upon and support those models, were then viewed as no longer adequate. Contradictions or tensions emerged in the system of sex role-regulated behavior including demands for political, social, and economic equality of the sexes. These contradictions will only be resolved as new more developed conceptions of maleness and femaleness emerge that are consistent with a greater range of male and female activities and with equality between the sexes (see Gilligan 1978, 1982).

The basis of the equilibrium in this way of thinking are (1) the assumption that/change is what is most fundamental; and (2) the ability to conceptualize changes as (a) emergences of contradictions within existing systems and (b) formations of new, more inclusive systems. The nature of maleness and femaleness is not viewed as fundamental; it is seen as likely to change through history. At any point in time it may be useful to conceptualize the regularities in male and female roles, but these conceptualizations are meaningful as part of a historical process in which they will be challenged and transcended.

A closed-system model of sex-role behavior, which claims that such behavior derives from fundamental immutable laws of male and female temperament, must necessarily ignore or attempt to suppress what begin as anomalies and later become new patterns of behavior by males and females, if the equilibrium of the system is to be maintained[4] (i.e., if maleness is to continue to be recognized as maleness and femaleness is to continue to be recognized as femaleness). In contrast, a dialectical model can incorporate such anomalies and new patterns while maintaining equilibrium by recognizing them as developments in the continuing dialectic of the relations of the sexes.

---

[4] Note the arguments of the “Moral Majority” here.

I have argued elsewhere (1980, 1984) that dialectical thinking describes a post-formal level of cognitive organization. This argument is based in part on the fact that dialectic as an organizing principle builds upon (and treats at a level of greater complexity by integrating with the dimension of change over time) the concept of system, which is the organizing principle of formal operations. The argument is also based in part on the greater equilibrating power (ability to maintain recognizable continuity in the midst of a broader range of change) of dialectical cognitive organization vis-a-vis formal operational organization. But it should be clear from the above example that my view that dialectical thinking is a necessary advance in equilibrium is also based on the general ontological assumption that people will be confronted with anomalous events that do not conform to prior closed-system laws.

In the natural sciences, this general ontological assumption amounts to the assumption that scientists will have to deal with scientific revolutions (Kuhn). In the life sciences and social sciences, it amounts to the assumption that the phenomena dealt with are highly susceptible to rapid and radical change, which scientists will need to comprehend. In day-today life, it amounts to the assumption that for making practical decisions, closed systems (including moral systems) that are constructed on the basis of limited data and from limited perspectives will be inadequate. Social life is complex and requires multiple perspective-taking. People will be confronted with new data and new perspectives, and it is important that their cognitive structures leave them open to taking these new data and perspectives into account, accommodating to them, and dealing with them constructively. Confrontations, in science and in life, with phenomena that demand recognition of multiple interacting systems and radical transformation of systems, will point out the limits of formal thinking and stimulate the construction of more dialectical forms of reasoning.

Facilitating the Development of Dialectical Thinking

The above assumptions imply the importance of dialectical thinking to the achievement of cognitive equilibrium. This does not, however, imply that all adults in fact achieve this level of equilibrium. Research indicates that just as all adults do not fully develop formal operations, so they all may not develop dialectical thinking. Whether individuals do develop dialectical thinking depends on both environmental factors and developmental characteristics of the person.

First of all, fully developed dialectical thinking presupposes something like what Piaget calls formal operations. The ability to organize the world into an abstract consistent systematic pattern is a prerequisite to proving an account of how such patterns evolve and change. It is certainly possible to recognize the ontological and epistemological centrality of change, as well as the power of relationships, without organizing the world into systems. In fact, these recognitions may constitute preformal precursors and dialectical thinking. However, to do more than assert the importance of change and relationship—to actually describe the course of dialectical change over time—requires the ability to describe the temporary patterns of organization systems that constitute moments in dialectical processes.

When adults systematize the world (1) using sets of fixed categories, and (2) holding to static ontological and epistemological assumptions often associated with formal thought, their maintenance of cognitive equilibrium depends on their power to seal themselves off from anomalous data and discrepant viewpoints. For example, with respect to the analysis of sex roles above, individuals may attempt (1) to force others to conform to their notions of sex-appropriate behavior, or (2) to isolate themselves from individuals whose behavior does not conform, in order to maintain their systematic understandings of the nature of masculinity and femininity. These strategies are surely not optimal from the point of view of a concern with expanding human sociality, but they may succeed in the short term if the individuals employing them are powerful enough. However, if adults cannot seal themselves off from discrepant events, they are likely to experience frustrations and conflicts resulting from the limits of fixed categories of thought for addressing a changing reality.

When this happens one of two things is likely to occur. Either the adults will reject formal operational thinking and resort to less logical forms of thought, or the adults will begin to reorganize their formal operations within the context of the more adequate organization of dialectical thinking. A combination of personal support, exposure to diverse perspectives, and opportunities for careful, critical reflection will facilitate the latter outcome of Inglis and Steele’s (in this issue) description of "complexity intelligence." The description of dialectical thinking as an approach to modeling events is clearly more specific in some respects, while the authors' definition of complexity intelligence is more specific in other respects.

I would like to consider briefly the categories of practice mentioned in that article. The authors mention personal therapy and coaching as examples of professions intended to support development at the individual level, while they also suggest that "cultural coaching" be institutionalized as the practice of creating containers for dialogue, exploration of diversity and differences, and opportunities for transforming exchanges. On the one hand, as someone who has practiced psychotherapy for over 20 years, and spent much of the time engaged in the training and supervision of clinical psychologists in psychotherapy, I would have to say that the authors' view of this profession is somewhat over-idealized. While some in the profession may aspire to stimulate complexity intelligence, it is probably a minority of the profession who define their role in anything like this way, and an even smaller minority that practices in the ways the authors describe. (I have written extensively on this topic-- See Basseches, 1997a, 1997b, and 2002). At the same time there are also several professions that come to mind, in which at least a substantial minority of practitioners might view themselves as engaged in something quite like the practice of "cultural coaching" as defined by Inglis and Steele. Higher education is one example of such a profession, but there are probably quite a few others such as politics and journalism.

In the remainder of this article, I will consider this range of contexts -- with a focus on higher education and psychotherapy as institutionalized examples at the individual and cultural levels. I will address the question, “What conditions must prevail and be widely available to adults if they are to serve as effective contexts for the development of dialectical thinking?” Several hypotheses suggest themselves.

First, these institutions must not be content to maintain a discourse simply at the level of "established facts." For example, institutions of higher education must present students with multiple frames of reference-multiple justifiable coherent ways of interpreting facts based on diverging assumptions-that can be contrasted to each other. This experience is likely to lead students to recognize the active, relativistic nature of the process of interpretation, a crucial recognition in the movement from formal to dialectical forms of cognitive organization.

Similarly, students should not be presented with single "correct" methods of discovery.

Rather, alternative paradigms for research should be contrasted, and all methods should be open to question based on their appropriateness to various human goals. The recognition of the relativity of the very process of research (i. e., the construction of facts) to alternate modes of interpretation forms a crucial foundation for development of dialectical thinking.

At the same time, educational institutions should not be content to leave students in the transitional swamps of relativism. Students should recognize that there are multiple ways of looking at things. However, it is also important to recognize that these multiple ways of looking at things, along with the people who look at things in these ways, interact with each other over history. Advances in human knowledge occur when people succeed in synthesizing valuable aspects of different perspectives so that they function together as a whole, just as advances in history occur as the people who look at things in different ways learn to live together harmoniously.

Multiple conflicting frames of reference and multiple points of view must be presented to students as facts of life and as crucial moments in dialectical processes. But while these facts of life are presented as facts to be recognized, they must not be presented simply as facts to be accepted. Rather, each instance of conflicting points of view must be presented to students as an epistemological challenge-a challenge not only to the student but to the faculty as well. It should not be expected that the student will meet the challenge by resolving such conflicts in the course of the semester, or perhaps even in his or her lifetime, but it should be recognized that to be a seeker of truth means to try. For it is through the efforts of those who have taken on the challenges of trying that knowledge has advanced.

Finally, educational institutions must provide personal support for development, or, as Perry (1978, 267) has put it, educators must share "in the costs of growth." They must recognize the pain of letting go of a world where every question has a right answer and either authorities or logic can be counted on to provide the correct answers, to slowly build a world where the only answers one will have are those one has struggled for—a world where in many cases one will struggle and not find any at all and where in the rest of the cases the answers one finds new questions. Educators must at least acknowledge their own pain, which comes of being dedicated to truth.

For if teachers hold up a bravado of confidence and comfort, students have to cope not only with their own pain but also with the feeling there is something wrong with them for feeling this pain when their teachers appear to breeze through a relativistic world so nonchalantly, in command. Beyond acknowledging their own intellectual pain sharing it with students, educators can actually share in students' if not by holding hands, at least by holding minds. Educators will themselves with many more opportunities to revel in the joys of students' growth-to share the release of emancipation that occurs the students realize new degrees of freedom-if the educators are willing to share in growth's costs.

Now let us compare the institution of higher education, a context in which the shared social commitment to rationality is normally taken for granted but where the need for personal support is too often ignored, with psychotherapy, a context in which the reverse is often true. Psychotherapy is another context in which the development of dialectical thinking in adults may be fostered. In this context, one finds more prevalent recognition of the importance of providing personal support at times when the individual's sense of coherence in the self and world are under attack. However, a greater understanding of, and more explicit commitment to, dialectical rationality on the part of therapists would make psychotherapy a more effective context for development.

The modal source of threat to self/world coherence is somewhat different in psychotherapy and higher education, although there is also significant overlap. Whereas in higher education the challenges to one's way of making rational sense of things are likely to come from exposure to alternative ways of making rational sense, in psychotherapy aspects of one's experience of self and world which are internally in tension with one's ways of making sense are more often the source of the challenge. Comparable to the educator's task of balancing supporting students' realization of the existence of alternative ways of looking at things with the awareness of possibilities for growth from the interaction of perspectives is the therapist's task and supporting both openness to discrepant aspects of one's experience and the desire to build a coherent sense of self and the world that integrates these discrepant "irrational" experiences. While in the social setting of higher education the shared commitment to rationality is built upon to maintain the balancing act between doubt and integration, in psychotherapy a commitment to suspending the demands of rationality is needed to protect the dialectic from "rationalization" and to maintain clients' openness to their own experience. Nevertheless, a commitment to the client as a rational meaning-maker is equally important to support the client's integrative tendencies and capacities, within which dialectical thinking can develop as a crucial tool.

Within higher education, the relationship between theorizing and practice is perhaps analogous to the relationship the therapist must maintain between the client's rational capacities and the fuller reality of the client's experience-in-the-world. The positive effects of the educational process are likely to be limited insofar as it is divorced from practical concerns. If one only studies the systematizations of science and philosophy as abstract objects rather than attempting to systematize the dynamic contradictory realities of life beyond the laboratory and the classroom (students' own lives and those of others), encounters with the discrepant may be limited. On the other hand, if (as happens in much preprofessional education), practical problems are addressed but the definitions of the problems are taken uncritically, from a single point of view, discrepancies may also be avoided (especially if the point of view is that of powerful elements of society-elements strong enough to impose the order of a static system on the lives of others.)

Conclusion

Looking back at what I wrote 20 years ago, I continue to believe that we have no choice but to seek patterns, build patterns, and live within patterns. But I agree with Inglis and Steele, and the others whose work they cite, that the processes of disequilibrium emerging with the patterns are so pervasive that attempting to maintain and rebuild coherence at every organizational level is extremely difficult work for all of us.

Looking back, I also noticed that in my example of a dialectical approach to courtship, marriage, and breakup, I moved subtly from use of the pronoun "I" to use of the pronoun "we." In doing so, I also subtly neglected that possibility of a relationship that one partner approaches dialectically, while the other approaches it with a relatively fixed and resistant-to-change model of what marriage should be. Living, in the twenty years in between, through the pain of such a marriage and its breakup, has sensitized me to the more general pervasiveness in the world of a particular type of an encounter. These can be characterized as encounters between those adopting more dialectical or integrative perspectives, and those who cherish structures, however magnificent, in ways that lead them to defend those structures at the expense of being able to take in what is left out. I invite, indeed implore, the readers of and contributors to *Integral Review*, to attend to and to develop the theory, research and praxis of such encounters.

Toward An Integral Process Theory Of Human Dynamics: Dancing The Universal Tango

Sara Ross

Abstract: This article is an outline toward developing a fuller process theory of human dynamics aimed at practical applications by a diverse audience. The theory represents a transdisciplinary synthesis of a universal pattern and integrates humans' projection dynamics with complex systems dynamics. Five premises, presented in lay language with examples, capture basic elements involved in the meta process of human development and change: reciprocity, projection, development's structural limits, oscillations, and structural coupling. Based on a fractal dialectical pattern that shows up wherever complex systems are involved, the theory's applications are scalable. It could be useful for personal development, public policy design, issue analysis, and systemic action on intransigent issues. It may be a complementary adjunct to developmental stage theories because it deals in an accessible way with the processes involved in stage transitions. Throughout the article, its practical relevance at some individual, social, and political scales is illustrated or mentioned. Readers interested in individual and social change may gain a sense of the human dynamics involved in it, and thus the potential usefulness of a process theory that describes what goes on in human change and development.

Key words: developmental process, dynamics, fractal, human development, integral, meta pattern, meta process, metasystems, oscillations, physics, processes, process theory, projection, psychology, public policy, public issues, reciprocity, reciprocal interaction, social change, structural coupling, systems, tango, universal

> *Everybody knows the world is made up of processes from which patterns emerge, but we seldom give pause to what this means.*
> *~ J. A. Scott Kelso (1995, 3)*

Introduction

This article outlines an integral process theory that attempts to capture and integrate the meta pattern of dynamic processes involved in individual and social change and development. It offers a window into the processes of human dynamics, akin to the "black box" installed in a modern aircraft that tells what operations the aircraft has performed to adjust to flying conditions, pilot instructions, and its own mechanical functions and malfunctions.

The idea to formulate this in terms of a theory is a result of realizing I could no longer write about some subjects of social significance without having it—and some, though not all, of its implications—already spelled out in an independent and transdisciplinary way. Its genesis was

SOME RIGHTS RESERVED

this last year's series of attempts to produce manuscripts I was excited about, only to abandon them because they did not succeed in developing the subjects in writing as robustly as my thinking off-paper did. Each subject needed a lot of foundation laying before I could launch into it. I found myself trying to squeeze in references to only parts of this pattern, which just obscured it and packed its "building blocks" like sardines in a can. My central subjects were left no room to develop into the depth of social analysis I was aiming for in the first place. Through discussion with colleagues, I came to realize the whole set of premises my thinking has been based on for quite a while constitutes a theory, and it needs independent description as such. Thus, this article's origin is self-serving and functional. I offer it because I believe it can serve others in functional ways, too.

The theory's origins are not easy to relate as briefly as this article's origins. Overall, it is the result of my last twenty years' processes of integrating an eclectic range of reading and study with my continuously evolving experiences in all domains of life and intense exploration and integration of them. Periods of individual and family counseling awakened and sharpened my attention to projection dynamics and how they change. Myriad syntheses became platforms for subsequent ones, resulting in the scaffolding represented here. This process theory of human dynamics describes my own process in arriving at it, too. Milestones in my understanding in recent years included:

- Several years of intense study of over a dozen developmental theories and internalizing the human story they tell with the stories that life tells;
- Internalizing *how* our structures of operating[1] involve our entire function *as* whole, undivided organisms;
- Recognizing the concepts of reciprocal interactions and structural coupling are formal terms for the personal micro and macro processes of development I observed in my own functioning as well as in my family, one-on-one ministry, and public action research. Together, they led to developing my theory of how to foster individual and socio-political development – that development progresses *while and by* engaging in complex interactions (which I later found Vygotsky (1978) saying too);
- Integrating all the foregoing with why Bateson (2000) says cybernetic systems are the units of evolution
- And finally, delightfully, having the last explanatory "chunk" that tied it together for me fall into place via Laszlo's (2003) physics, and Wolff & Haselhurst (2005) recently tied the bows in it.

According to Commons and Richards (2002, 2), developmental theories need to address three dimensions of behavior: "a) what behaviors develop and in what order, b) with what speed, and c) how and why development takes place." This article addresses the third dimension: the how and why of development. It is about a *process* theory of development that refers to and requires developmental theories' specific insights. This dimension is often missing in developmental theories because "developmental psychology as a whole has been concerned with what develops and in what sequence" (Commons & Richards, 2) and has been largely silent about the processes involved. Complementary to the work of those authors, this approach to a process theory of human dynamics helps to fill that void.

---

[1] Instrumental for my understanding were Rosenberg (1988; also see 2002) and Michael Commons' work with his numerous colleagues (see references).

A Way To Peer Into "black boxes"

For many people, trying to understand human behavior can engender a desire to "peer into the black box" of individuals, groups, communities, organizations, governments, and societies. For those of us committed to fostering healthier individual and social relations and development, there is a fundamental need to understand the processes underlying them. Processes and the patterns they create have explanatory power for understanding how and why things happen as they do. Since the meta pattern's processes transpire at all scales, the theory may be useful to a broad range of interests, which include but are not limited to personal, socio-political, and theoretical, e.g.:

- For people who want to increase their self-awareness and its reflexion, it could facilitate new noticing of specific inner and outer dynamics and learning more about one's own motivations, assumptions, reactions, choices, and the learning process itself.
- For those who develop policy or organize approaches to address complex issues, it could be a complementary framework to recognize patterns that can hold intransigent issues in place as well as open them to healthier conditions.
- For those who study or use theories with universal stages of human development, this could complement them with an organic look at the dynamics involved in stage-transition processes.[2]
- For those who study complex systems and wonder how they correlate with developmental psychology or even describe humans, this may be an introduction.
- For those who think and write about human issues and design methods to address them, the theory may serve as a foundational set of assumptions from which to launch analyses, and enable them to focus more directly on their specific subject matter because some of the basic assumptions can be referenced rather than explained anew.

The meta pattern captured in this theory shows up in all systems' dynamics at all scales of time-duration, breadth, and depth. In terms of humanity and time, it ranges from an instant, to the duration of reading this article or being in a meeting, to the lifetimes of individuals, organizations, and societies. In terms of breadth, its dynamics occur in our individual selves just as they do in dynamics between and among individuals and social groupings, our cybernetic systems, and our socio-cultural systems. In terms of depth, it is inherent in the nested layers of systems and metasystems, from individuals all the way up through their societies and beyond.

One implication is that we all participate in the processes and contribute to the pattern because they are inherent in how we function, interact, and develop. Yet, it is often difficult to notice things we are embedded in doing. Noticing patterns involves stepping back from things a bit. My aim for this article is offering an opportunity to step back, and to make transparent (a) the dynamics that make up the pattern I call the universal tango, (b) the many scales on which we are dancing that tango, (c) the "how" of the dance, and (d) the significance of observing the underlying processes in the "black box" of change and development.

Outline of The Process Theory

Introducing the Meta Pattern It Describes

The outline I am presenting is based on the synthesis I described earlier, of years of eclectic study and observations, analyses, and reflections on processual patterns in myself, others, and the world we live in. I encountered evidence of the pattern everywhere in these domains whenever I "saw through the costumes" it dresses in across scales of time and space. Whether dressed up as anthropology, biology, chaos and complexity, education, human energy systems, history, neurology, philosophy, physics, political science, psychology, or theology, I found (as did Kelso 1995) that a range of fields describe the similar processes and patterns. I noticed, as did Van Eenwyk (1997, 13), that "analytical psychology and physical and mathematical science all employ virtually identical metaphors to understand particular phenomena." A dynamic meta pattern shows up, and in Kelso's terms, I gave pause to what it means. Condensed in one place here, it may give pause to others, too.

To convey this with practical applications in mind, I discuss it in tandem with a case to illustrate it at familiar personal and interpersonal scales (while I also take reasonable opportunities to indicate its broad application at all scales). I choose this focus for three reasons. First, we have in common our lived experience of the personal and interpersonal scales. Second, I have a conviction born of my own experience that when we (a) discover and become intimately acquainted with the dynamics going on in our selves, and (b) recognize how those dynamics play out in our interpersonal lives with others, that (c) we are far better equipped to recognize and understand dynamic processes of many kinds going on everywhere else and thereby transfer the learning. This is how we learn to "peer into the black box" of human dynamics. Finally, I hope by discussing it at these familiar levels that this article will be meaningful beyond any intellectual exercise.

To offer readers a sense of the theory's applicability to other scales of experience, I periodically refer to dynamics reported in a short, web-accessible booklet. The result of participatory research with youth on the issue of substance abuse, it includes an approach to addressing the issue at the community level that reflects some understanding of this meta process.[3]

While I want this outline of a theory to indicate the rigor that produced it, my purpose in this brief article is its general introduction, not its theoretical defense. Therefore, my writing style is non-technical and I confine theoretical supports to footnotes that represent the broad transdisciplinary supports and foundations. My aim is to make this outline accessible so it is useful for (a) noticing and unpacking dynamics' layers and relationships (b) ongoing reflection on what can be learned from them (in order to integrate the learning), and (c) eventually transferring the learning to perceptions of other events.

---

Premises Of This Process Theory

The theory describes one overall meta pattern I call the universal tango. As Kelso suggests above, patterns emerge from the processes that comprise them. I describe this pattern through five straightforward premises about its processes' qualities. My introductory-level outline of those premises is accompanied by the phased introduction of a model that depicts each premise's *role* in this pattern of human dynamics. The premises are:

1. It takes (at least) two (of something) to tango.
2. Whatever we don't tango with directly (but could), we put "out there."
3. There are limits to what we can tango with, and they diminish as we develop.
4. There are common dynamic processes involved in dancing the tango
5. Something new emerges from each and every tango.

These premises are like different zoom-angle lenses on qualities of the whole pattern. They represent its dynamic processes. Although they have item numbers for convenient reference, they should not be viewed as a linear sequence of steps because they are not steps at all, but rather premises about a whole. They aim to "reveal the whole elephant" by touching on key aspects of it. This is an important point that is easy to forget when we read in a linear, sequential fashion.

Premise 1: It takes (at least) two (of something) to tango.

Nature, including our thinking and our personal experience, is full of what we call two-ness, dualities, or polarities.[4] The old dance saying that "it takes two to tango" is a useful reminder that we are never with "just ourselves" but rather we are always in interactive relation *with* our selves, others, and our larger environments. Interactive relations are characterized by continuous, dynamic feedback and feedforward processes or loops that connect the people and systems involved.

This first premise is that various forms of interaction of one with another are existential characteristics of being human. Such interactions are always going on at all scales of functioning we can identify. This is the universal dynamic of *reciprocity*.[5] It takes at least two of something to tango, and there are always tangos going on. For example, from the conditions that give rise to teenagers' stress[6], to their reactions to that stress and their ways of coping with it,[7] to rewards of various kinds for supporting a political candidate, to the "tit for tat" behaviors between nations and other groups, the recursive feedback and feedforward loops characterize humans and all open systems. These dynamics look different—they "wear different clothes"— depending on contexts, scales, and how we adjust our zoom lenses to notice them. However, once the clothes are removed, once we look inside the "black box," we see the same dynamic pattern operating below the surface.

---

[4] Systems from cells to humans to societies to galaxies and beyond are a part of and in relation (two-ness) to other systems, and even movement has relations to itself. New physics' understandings of the nature of matter posits waves of motion in two directions, in-coming and out-going (Haselhurst & Wolff, 2005).

[5] Different terms are employed by various fields to refer to reciprocity dynamics, e.g., the human universal called reciprocity (Brown 1991), the reciprocity complex (Gouldner 1977), reciprocal perturbations (Maturana & Varela 1987), the reciprocal dynamics evidenced in brain research that apply to interpersonal, socio-political, and economic behaviors (Cory 2004), the reciprocal interaction of the universe's domains (Laszlo 2003), etc.

[6] *The problem behind the problem*, p. 4.

[7] Ibid. pp. 5-6

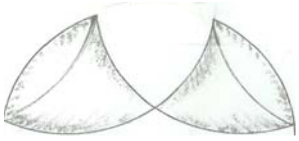

Figure 1

In Figure 1 an organic double funnel represents this premise, with dynamic and symbolic significance. Like one of the basic movements in the tango, it has resemblance to the figure 8 and also hints at strange attractors and the infinity symbol. In applications of this model, the funnel stands for the system we are focusing on at a particular moment in the course of trying to understand something. Its open "ends" indicate the (at least) two-ness of relationships with things beyond our immediate focus (which might be, e.g., our self, teenagers under stress, the juvenile court system, the community, etc.). Though hidden from our view, within any system's bounds there is a tremendous amount of dynamic activity going on.

Application of Premise 1

What happens when we act *as if* we do not realize it takes at least two of something to tango, yet there's always a tango going on? I can illustrate this with the case of my earliest self-aware recognition of this dynamic. About fifteen years ago, I was in the internship phase of a training program for the one-on-one ministerial work I do. I knew from the way she dispassionately characterized her way of "doing life," while introducing herself to the group of interns, that the supervisor who was assigned to me was not the one I wanted to work with. I asked the program director to assign me to a different supervisor, explaining I perceived in advance we would be a mis-match. Told that all staff were fully booked and reassignment was impossible, I discussed with the supervisor my willingness to give the supervision relationship a fair try even though she was not my preferred choice. She reciprocated by saying she would do her best with me and for me. At the end of the internship, we wrote our respective, customary supervisor and supervisee evaluations. Mine focused on what I learned about myself and my way of doing that ministry, the subjects explored or discussed in our supervisory sessions, and was silent about my experience of relating with her, as if it had not been important. Her evaluation of me was also silent about our way of relating, but included a distorted reference to things I had shared with her about the transparency I experienced while working with retreatants: she wrote that I reported those experiences as being "opaque." I brought the error to her attention, and she corrected it before flying back home. We did not together investigate its roots. What had been happening between us? Over the next weeks, I was on an inner crusade to unpack our tango.

It became my first *consciously aware* encounter with the amazing reciprocity involved in a coping mechanism. I discovered that I had been "taking care of *her*" throughout the internship. I did this by not saying that I felt neither "met" nor "heard" by her, and that it had become pointless to explore anything very meaningful in our sessions. The tango lesson was this: at the time, I thought I was simply "taking care of *me*" by withholding explorations I would find meaningful to share with her only if she could live into the supervisory function of meeting me where I was. It was only when I realized that I took care of me *by* taking care of her, that I saw the reciprocal dynamic. Instead of taking responsibility to express my dissatisfaction and thereby let her take responsibility to hear and respond to it, I took care of her, and the program too in a way, by my silence. I suspect she sensed this on some level, yet like me, she was not transparent in expressing her experience. Thus, a misapplied "opaque" emerged in her evaluation writing.

We were doing a tango, but *acting as if* we each were alone on the dance floor, like only one end of the funnel in Figure 1, *as if* severed from the real interaction between us.

How many of our tangos—as an individual, an organization, a nation—are characterized by acting as if we are alone on the dance floor? From the developmental perspective, we spend a great deal of our adult lives carrying forward a perception we developed when we were younger, an atomistic feeling of being alone in a big world we have to navigate alone. It is a natural part of the developmental process to operate on this subtle, often-unnamed assumption. This first premise can support reflection and analysis on our assumptions about our interactions and dynamics within our selves and with others at any scale. Applicable to every instance and situation, this can help us discover where we operate as if we assume we are doing life's many tangos alone. While there is truth in the saying that "our perceptions are our realities," it is also true that rarely do our perceptions take in all the realities that comprise our world. It is possible to learn how to take in more of them. As the case suggests, we understand our selves and our experiences to a greater degree when we can recognize, learn from, and consciously engage the reciprocity dynamics we're embedded in.

Premise 2: Whatever we don't tango with directly (but could), we put "out there."

Despite any subtle, deeply-seated—and transformable—existential assumptions that we navigate life within our own isolated orbit, we do not. We are not only dynamic open systems as represented by the organic funnel, but we also exist in a multitude of larger contexts with which we are always already in mutually co-creative and sustaining interactions. To represent this in the model, I add two multi-dimensional "wholes" or environments that organically give the funnel its shape. Premise 2 focuses on a particular kind of relation with our environments (and they are discussed more in later premises).

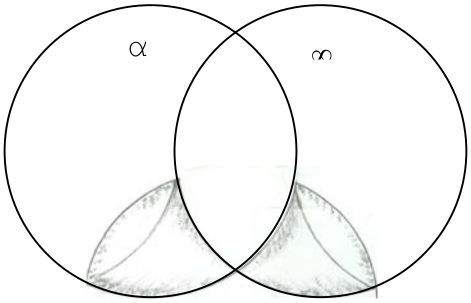

Figure 2

This second premise shines a bit of light on usually invisible dynamics we experience to point to their relation to premise 1 and their place in this overall pattern. They are usually invisible because we assign meaning to events that affect us in some way, and meaning is an invisible subjective thing. As humans, we participate in two large domains or systems: those with well-developed language and therefore thought, meaning-making, consciousness, etc., and those without.[8] Languaged thought helps us assign meaning to complex events and to communicate that meaning to ourselves and others. Given that we inhabit such large domains, it's a big world we live in, and none of us can take it in all at once, or sort out meanings all at once; sometimes we just do not want to. Ironically, there are also aspects of our selves, others, and our environment that we *have* taken in and *do* know about, but we are not yet *consciously* aware of *what* we know of them, i.e, it is not languaged thought. The case example illustrated how I kept from myself the knowledge that I took care of my needs *by* taking care of (what I perceived as) my supervisor's need to avoid facing (what I experienced as) her inability to meet and hear me where I was. I did not tango with what I knew somewhere inside, but *could* have; instead, I put it "out there" somewhere.

---

[8] This premise reflects a coordination of psychology's insights into projection with biology's and other complex systems sciences; the physics' version of the "mechanisms" of projection can be found in Laszlo (2003). I believe one implication of having our feet in both domains is that we need to coordinate our assumptions about them when we are paying attention to things that may appear specific to one or the other domain. For example, in Miller's (1995) seminal work on living systems theory, he observes that despite their vast differences in size and complexity, there are [at least] eight levels of living systems: cell, organ, organism, group, organization, community, society, and supranational system. All of the systems have the same 19 critical subsystems with distinct functions to process information, matter, and energy in various combinations he identifies, and all exhibit a common set of systemic characteristics. On the other hand, Maturana & Varela (1987) point out that in addition to treating individual humans as the organismic systems they are, we must also consider our identities as "components of [our] linguistic

Projection is a concept used to describe such things we do not tango with *directly*. It's a complex dynamic, especially because our languaged thought underlies so much of our ability to assign meaning to events. Things have meaning when they affect us. Things that affect us are—in systems' terms—interacting with us (and our meaning-making). All interactions involve a tango, and humans have ways of choosing whether to dance directly or indirectly. By contrast, other mammals seem to respond immediately *and* directly to environmental impacts, e.g., the fight or flight instincts. The purpose of premise 2 is to introduce that projection dynamics are part of our system dynamics and the universal tango we do. It extends projection's significance beyond the psychology field that first explained it, to include its place in a universal set of processes.

Projections can have a co-dependent aspect. It is common to refer to co-dependent coping mechanisms, such as I displayed in the case, as *dysfunctional.* They are also highly functional, because this is how we filter out what we feel we cannot yet deal with if it does not feel safe to do so. Yet that very language, "filter out what we feel we cannot yet deal with" refers to only half of the reciprocity complex. Fifteen years ago, my limited awareness of *how* I was taking care of me with my internship supervisor was also just half of the dynamic. It is essential to learn how to look for the "loose ends" if we want to peer into our black boxes. Oftentimes, projections are some of those loose ends, and they show up at many scales, including that of nations.

Projection "wears different clothes" depending on the context and focus. The case example helps to illustrate the logic of the process, which might help us to notice it. The basic logic is: what we do not take in, we put "out there." It is analogous to this: we keep inside our houses those things we want to preserve intact, and we place whatever we don't want to preserve, e.g. trash or garbage, outside in a garbage can or compost pile. Sometimes this is called *bracketing reality*, putting limits on what we want to deal with, and it can show up in different ways. Some of the teenagers I did research with used drugs and alcohol to bracket the reality of unmanageable stress, an *overt* way of dancing with reality. But, if the reciprocity complex of recursive feedback loops cannot complete overtly, then it will complete *covertly*. This is because there are no "loose ends" in whole system dynamics. The covert dynamic called projection is analogous to a movie projector that puts the story out onto a screen so we can see it when it feels safe enough to do so.

Another analogy for projection's logic is sunlight shining on a tree that then casts a shadow on the ground. Our *knowing* is like the sunlight, *what* we know but do not take into our conscious

---

domains" and recognize that "human social systems exist also as unities for their components in the realm of language" (198). In other words, human social systems derive from our capacity for linguistic behavior, and as individuals we have characteristics of both domains. Therefore, "any analysis of human social phenomena that does not include these considerations will be defective, for it negates the biologic roots of those phenomena" (199).

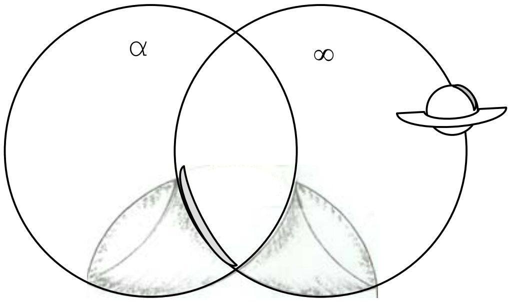

Figure 3

awareness and interact with has substance like the tree, and we find a place to "put it"—to project it "out there" somewhere—until we are ready or need to notice its shadow. Our human growing edges always include learning to recognize what we project about our selves somewhere else "out there." I believe there is a correlation between the amount of projection we do and the degree to which we also perceive ourselves navigating life alone. Thus, in the model, the planet Saturn represents any place "out there" we park things we do not tango with overtly, and its corresponding shadow is indicated behind the open ends of the funnel.

Implications of Premise 2

Images and models are one thing, and our real life system dynamics are another. What happens in projection and where do things really end up? There are different ways to consider this, and a common one is that, from a Jungian perspective, the shadow ends up in our unconscious, and the disowned *emotion* of whatever we do not dance with will flavor our perceptions of other people, events, systems, or beliefs. Thus, my supervisor probably projected her resistance to naming our mutually opaque relationship by putting the opacity "onto" (the way she heard) my experience with retreatants. In a corresponding way, I projected my assumption there was no resolution to my dissatisfaction by taking care of her: I had a lot at stake in that internship and did not want to risk the consequences of finding no satisfactory resolution. When we perceive we have something at stake, emotion accompanies the perceived risk. A way of noticing projections is by attending to *all* of our emotions, which alert us to their presence, and "recognizing the emotions that accompany projections begins the process by which they can be withdrawn from others" (Van Eenwyk 1997, 101).

As dynamic systems we have a lot of self-preserving or self-optimizing mechanisms, and in the context of projection, of course, one of them is that, at a systemic level, we do not allow ourselves to consciously know what we know we feel. This seems to reinforce subtle assumptions of navigating life in our own lonely orbit, and the reciprocal feedback/feedforward loops "go underground." In his discussion of the transference aspect of projection, May (1983, 19) defines transference as "*the distortion of encounter*" (emphasis in the original). The same is true of the overall dynamic of projection, because "participating [in relationship] always involves risk" (20) and the "norm of relationship…is grounded in the nature of man [sic] as such" (18). Risk avoidance distorts our encounters by handling our part of the tango covertly, rather than overtly.

Until we withdraw projections from "out there," conflicts (at some scale, perceived or real, internal and/or external, covert and/or overt) usually arise because some unresolved tension (e.g., lack of safety) underlies why we projected in the first place. At those times, we are not transparent about whatever seems to be practically or emotionally at stake. What we usually have at stake is a relational concern of some kind. (In severe cases it can be our relation to our own survival.) In the case example, I was more concerned about my relation to graduating from the overall training program than I was concerned about my ways of relating with its internship supervisor. Conflicts can bubble up from within these layers of different priorities, and this has as much significance for socio-political patterns as it does for personal ones to ferret out the layers.

In reflecting upon our experiences, can we trace the connections among our (a) experiences of emotions that arise, (b) the context in which they arise, and (c) what we have at stake, relationally? And if we reflect on an experience where we did not directly attend to those emotions at the time, what was the nature of the inhibitions we decided to live with? Did they represent a risk to some “bigger” layer of relationship? At our current stages of social-cultural development, we can find it a challenge to detach from our familiar concepts enough to recognize the pervasive roles projections play from interpersonal to local to international issues. One of several reasons it is hard is that projection is still an obscure concept for many people. This theory’s emphasis on its systemic role in human dynamics suggests the importance of learning how to notice its dynamics in a supportive way.

Premise 3: There are limits to what we can tango with, and they diminish as we develop.

This premise is described in a variety of ways in the fields of developmental psychology, anthropology, biology, and history. In familiar talk we refer to people having “filters” that limit what they are able to perceive, react to, or process, i.e., what they are able to tango with. This is a natural developmental process of the whole human being, and these perceptions of the world change as we grow and mature. As children, we may have believed stories that a stork delivered families’ newborn babies to them, or that Santa Claus and reindeer delivered toys worldwide. These were simple, concrete things we could picture, no more outlandish than many of our storybooks, and the arrivals of babies and toys were very real. We were unable at that age to recognize the stories as family myths, which is a more abstract concept. Our “filters” prevented a tango with the idea of a family myth.

As we mature into adulthood, we develop new, usually more abstract, ways to understand how the world works. Yet, regardless of specifics, as users of language and therefore thought, our filters are constructed in a basic way. William James (1997, 26-27) put it succinctly: “The first thing the intellect does with an object is to class it along with something else [that it resembles]…. The next thing the intellect does is to lay bare the causes in which the thing originates” [so there is an explanation for it]. And the next process we go through, whether consciously or not, is deciding what the thing *means* to us. This process of classifying, explaining, and deciding about meaning potentially develops us as we have more and more experiences. At any point in our individual and collective lives, we operate with some system of making-sense-of-things, which for all of us could be called a “filtered view” of the world. We can’t tango with things we can’t perceive because we haven’t developed the capacity yet. What we do not recognize, we do not tango with—like the concept of myth for a child. Instead, we believe storks deliver new babies.

The easiest way I know to describe *why* there are limits to what we can perceive is with arithmetic, in which adding numbers is the starting point. We know we cannot do multiplication unless we first can add. We cannot do division if we cannot multiply and subtract. Each task requires ability to perform the less complex tasks that build up to it. If we never learn any arithmetic beyond adding and subtracting, we will not have any way to conceive what multiplication and division are, what they are good for, or what they might *mean* to us. For example, if I am a street vendor selling individual fruits of several kinds, and quite a few remain unsold toward the end of the afternoon, the difference between knowing how to add and knowing how to multiply could have significant meaning for my livelihood. If all I know to do is add, I will keep selling them individually to whoever wants one or some, and leftovers may rot unsold, earning me no money. If I know how to multiply, I might change strategies and bundle the remainder into bags of various quantities of fruit. I could calculate the selling price of each bag, and in the remaining time need only a few customers to sell the remaining inventory at full price while it is fresh. I may even sell out earlier this way and get to go home sooner. Multiplication would have *meaning* for me.[9]

Relating premise 3 to the previous one on projection, there is a structural-limit source of projection. Similar to—but different from—premise 2, whatever meaning an individual or social system cannot process due to developmental limits is projected "out there" onto some other person, event, system, or belief. The teen substance abuse issue—and most other issues—illustrates this in various ways. An obvious one is our societal habit of delegating away to agencies "out there" the responsibility to deal with the "presenting symptoms" of issues. We do this even though we individually and collectively co-create and sustain such issues by our personal and institutional behaviors against the backdrop of the cultures we sustain. At certain stages of socio-cultural development, an example is populations' projections of heroic or father images on leaders they expect to defend and protect them from outside threats, and enemy images on those who are feared. The structural-limits source of projection is particularly noticeable when groups that act the same way toward others are variously called "freedom fighters" or "insurgents," depending on who is talking about them. Limits on what we can tango with in a complex world play roles in the issues and conflicts.

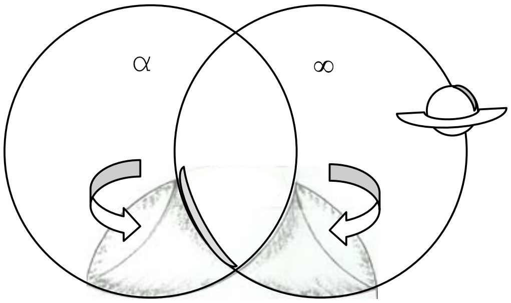

Figure 4

As signs for modeling the dynamic of doing life's tangos, and to signify limits to how much we can dance with at a particular time, in Figure 4 curved arrows that originate in the "wholes" of our environments indicate the smaller amounts we actually dance with in the funnel of life experience. Many limits diminish as we develop capacity for more complex interactions (like fancier dance steps), and if those limits decrease, we can perform a variety of fancier dance steps with more dance partners. We learn to dance *while* we dance, an idea developed more fully in premise 5.

---

[9] The math illustration is more than just an analogy. Arithmetic and mathematical operations do structure the increases in complexity of the tango-dancing we can do (Commons, Trudeau, Stein, Richards & Krause, 1998). The complexity of the meaning-making tasks we can perform, like dance steps, sets the furthest limit of what we can tango with at a particular time. This is because we do our tango with only the dance steps we *can* perform; anything more complex, like a myth for a child, is not perceptible because it requires more complex steps to "see" it at all.

Interim Summary – The Tango As Universal Learning Process

This meta pattern can be characterized as the universal learning process operating at every scale imaginable.[10] The premises of the theory describe the main dynamics going on in the "black box." From a certain vantage point we may begin to see a familiar, basic simplicity in the whole process. It is about the ways we learn, the *process* of learning. This kind of processual learning goes on with physically manifest systems such as human beings and the planetary environment, and with less tangible systems of projection and our institutional and cultural holding environments. We are thoroughly immersed in this dialectically-evolving process that constructs and deconstructs at the same time. It takes myriad forms at its different scales, for good or ill, but the same patterned process pervades our existence[11] and always constructs some form of learning. Learning always involves some structural change in some aspect of a system or person, something new. Figure 5 represents this as a new sphere emerging in the process.

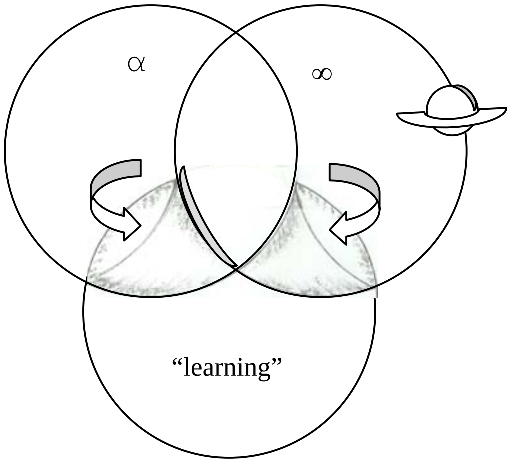

Figure 5

Premise 4: There are common dynamic processes involved in dancing the tango.

This premise focuses on *how* this dynamic learning process looks at a micro level, as compared to the relatively macro treatments thus far. The transformative learning field has provided essential insights into what humans do in the learning process, but does not seem to peer into the black box of *how* the underlying process looks and works. The process of determining what to dance with in life events (or what to park on Saturn) is the same *kind* of process we experience in our decision-making. Some decisions are much more complex than others, yet the *patterned process* is the same. This premise looks more closely at that pattern. If we perceive a decision lies between two options (e.g., yes/no, go/stay) there could be fewer factors to consider to come to the decision. If we perceive there are more than two options, there is a more complex bundle of variables to juggle. If a decision has several viable options and each option depends on contingencies, there are yet more layers of complexity to process in order to arrive at a decision (or a set of related decisions). A pause for reflection on a past decision we made between more than two options likely reveals a pattern of many back-and-forth interior movements (oscillations) to consider all the probable or possible costs, benefits, and consequences of any one choice. People construct many more options than, for example, other mammals, by virtue of having language. The more options we perceive, the more processing we have to do before we get to the end. Our common sense tells us that we can't know what we'll decide until we have decided it. A *dynamic process* is required.

---

[10] Here, *learning* means more than knowledge-acquisition in a formal (and formerly traditional) education sense, and in another way perhaps literally means the universe's recursive process of all-knowledge-acquisition-and-storage/retrieval/creation (see Laszlo 2003).

[11] This dialectical process is described across numerous fields, e.g.: Taylor's (1989, as cited in Mezirow 1991) model of transformative learning; per Riffert (2002), Piaget's genetic epistemology and Whitehead's process philosophy; Commons et al's various work in hierarchical complexity, Maturana & Varela's (1998) biology; Thelen & Smith's (1994) systems dynamics of the development of cognition and action, and Laszlo's (2003, 74) physics. The inclusion of projection is essential, in my view, to understand the structure of human dynamics without systemic "loose ends" otherwise left out of the process's equation.

This deliberative process illustrates in familiar terms the kind of process used by complex systems to determine what to dance with. The process is comprised of oscillations that move between at least two poles.[12] These could be characterized as possible choices. The oscillations may feel chaotic (when they are noticed, because very often they are not, i.e., in projections or where reflexive capacities are not developed). This is because the complexity of the process lies—in a scenario of conscious decision-making, for example—in perceiving, comparing and processing the implications of the various poles' *meanings* to us. In the process of assessing meanings, we may end up negating and transforming past beliefs and assumptions (Mezirow 1991). Such assessments are sub-processes nested within the overall process. Internal system dynamics like these can invoke the metaphor of computers: inputs and outputs processed through back-and-forth recursions at lightening speeds, faster for less complex problems, a bit slower for more complicated ones.

The process creates something new: a selection of new meaning, new insight, a decision (which might be a decision to not make a decision), discarding a former assumption and constructing a new one, etc. The process can co-create something else that is new: the capacity to coordinate more variables in a more complex way (changing the limits of what we can dance with, Premise 3).[13] By its conclusion, the process results in excluding some potentials in favor of others.

As a fundamental characteristic of dynamic systems, the oscillating process transpires at all scales, thus it has a fractal nature. Fractals are self-similar patterns that repeat at different scales, some from tiny to huge in size, and/or from extremely short to very long time-spans; the kind of pattern depends on where functions are similar (Kelso 1995). The vastly different scales can make them tricky to notice until we have practice at looking underneath the clothes that dress events and processes. To understand and apply this process theory (which is also fractal), systems' dynamics in general, and how these processes relate to functions at personal, social, economic, and political scales, it is very useful to learn to see *fractal patterns*. This can take a lot of the mystery out of things that seem very complicated, and contribute appropriate assumptions, order, and consistency to our analyses, evaluations, and reflections on experience.

The most accessible learning, perhaps, comes from our own laboratories of reflexive attention to the processes we use already, for example, in identifying how we feel about a disturbing interaction, figuring out (preferably with others) what is happening in a confusing situation, and decision-making. Cory (2004) emphasizes that the universal tensions between self-interested and empathetic acts are embedded in our constitution, and are "tugging and pulling against each other" (30) from the "smallest interactions, the vignettes, of everyday personal life" (26) to the scale of our social, political, and economic systems. These recurring oscillating processes "repeat themselves through the establishment of tensions of opposites, their resolution, and the subsequent appearance of new tensions between the resolution and new possibilities" (Van Eenwyk 1997, 16). They are the "basic moves" of the tango: it doesn't exist without them.

---

[12] These poles form and operate in similar fashion, although called by different names, such as: attractors in chaos/complexity terms (Kelso 1995; Van Eenwyk 1997); archetypes in terms of the psyche's dynamics (Jung 1964; Van Eenwyk 1997); behavioral tensions (Cory 2004); and wave function ensembles related to a given species (Laszlo 2003). Based on the observations I have made of my own processing, and consistent with Commons & Richards (2002), as we develop our capacity for more complex tasks, the *kinds* of attractors we perceive (Kelso 1995) change radically both in nature and number, and they can include complex nests of additional poles to process.

[13] These can develop a high degree of complexity, e.g., dialectical reasoning described by Basseches (in this issue)

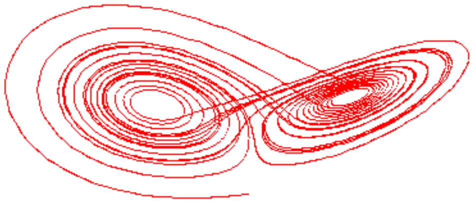

Figure 6

Premise 4's dynamics are the primary window for us to peer into *how* the "black boxes" of humans and their societies look inside as they dance. The tango exists in a multitude of interactions with other individuals, other cultures, other social structures, and their own selves. In their dances they conduct ongoing, often complexly nested, patterned, oscillation processes, acting like the "engine" of learning, change, development, and yes, deaths. For a look at a basic oscillation (from atmospheric dynamics) this link includes an animation of Figure 6's image of oscillation dynamics as the Lorentz attractor [14] and different views into the nested oscillations comprising it. http://www.levitated.net/daily/levLorenzAttractor.html

Premise 5: Something new emerges from each and every tango.

This premise points to the dialectical nature of the meta pattern, that the dynamics of the tango's processes create something new by virtue of happening at all. This is the *nature* of all life's tangos, because they are creative. The entire process reflects the synergy of "(1) the environments acting on the system, (2) the interacting elements involved, and (3) what emerges from the interactions" (Kelso 1995, 17-18). In the process model:

(1) the environments acting on the system [or meta system]
    a. are represented by the two spheres on either side
    b. the system that the environments "act on" (trigger, influence, constrain, liberate, etc.) is represented by the model's funnel
(2) the interacting elements involved
    a. are indicated by the curved arrows heading into the funnel's openings
    b. include the elements from the environment and the system's (funnel) elements
    c. and the "intersection" where the real dance takes place is signified by the starburst added to the model in Figure 7 below
(3) what emerges from the interactions
    a. is something new
    b. and it takes a variety of "forms" depending on what we're studying, its nature, time span we're considering, etc.

---

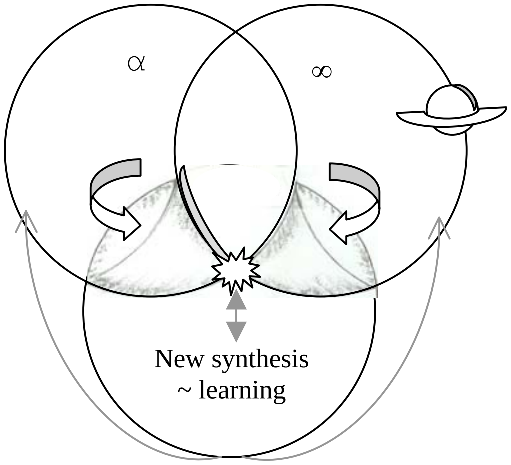

Figure 7

The significance of the tango's dynamic at all scales of time and space is immense: creation is learning how to happen all the time everywhere. From the perspectives of process, learning, and conscious awareness, all events *matter*, no matter how small. Helping us to *look for, notice, and use* this insight in new ways is a primary motivation for sharing this theory, and earlier points attempted to illustrate the implications at personal, interpersonal, and other social scales.

Application of Premise 5

My experience with the internship supervisor suggests some of the sorts of new things that may develop in a context like that. While the most significant new structural change in me was the learning that emerged from my crusade to understand what had been happening with us, it was throughout all our interactions that I built up, tore down, and built up something new in a recursive fashion. From hope to doubt, from invested trying to feeling unheard, from exploration to withdrawal, from resisting failure in relating to accepting it, from projection of self care to the explicit self care of confronting her error. It took interactions that created all of those new movements to create enough motivation in me at a systemic level to "bifurcate" into the new action of the crusade that, itself, was another series of diverse dynamics that restructured my understandings.

The new "things" that emerge from our tangos can include new systems. For example, if my experience with the supervisor had been very different, we might have created an enduring friendship characterized by mutual transparency (a new social system, as compared to the short-term, institutionally-created supervisor-supervisee system). The way we were structurally coupled did not result in dynamics for that possibility to emerge.

Teenagers developed a thorough description of how they and their substance abuse were structurally coupled with the cultures and institutions of their families, peers, schools, and communities (Ross, 2000). They were bound in such a way that the options they could access and make decisions about were severely limited. Their recursive learning from interaction upon interaction with those systems, in many cases, took the form of re-choosing their decisions to stick with their existing coping mechanisms for dealing with that stressful tango.

These examples hint at the significance of *structural coupling* (Maturana & Varela 1987) for change and development. Called by different terms, the dual-dynamic is inherent to complex systems, showing up wherever systemic processes are described.[15] The rather thorough treatments it receives in such works make for highly recommended reading. Often referred to as the diachronic and synchronic dynamics, which are always discussed together, it is *the structural dynamic of evolving development*. This concept is essential for understanding what's in the black box. This dynamic tango will challenge many of us to think in more fluid, systemic-process terms to understand its role in change, development, and overall evolution. In basic terms, it refers to the connective relationship between interacting systems and the new structures that emerge *in each* by virtue of the interaction. It accounts for *how* new “things” emerge. The concept of *structural coupling* supports attention to both our selves and our partners in every tango at every scale: we trigger changes in each other with every interaction and something new is created, for good or ill. It may be more projections parked on Saturn, it may be new capacities for more complex diplomacy and policy- or decision-making, it may be new social systems that are more generative or more destructive for people within them. This concept can reinforce the importance to place on every tango and what it creates.

[15] e.g., Bateson, 2000; Kelso 1997; Laszlo 2003; Riffert 2002; Thelen & Smith 1994; Van Eenwyk 1997; Whitehead 1960.

The Universal Scale of The Tango

For this introduction to be complete, it needs to refer at least minimally to this meta pattern’s literally universal depth and scale, developed in somewhat lay-accessible ways by Laszlo (2003), Wolff & Haselhurst (2005), and Bohm (1999). Applied at that depth and scale to this outline’s model, the environmental sphere on one side would signify what Laszlo calls the virtual domain of the universe, and the other environmental sphere would signify what he calls the manifest domain. The manifest is the domain of the entire physical universe, while the virtual domain is not as easy to consider because its virtual contents are described in physics terms[16] that do not resonate very much with those of us outside the math and physics fields. An important caveat: the model is visually misleading because these two domains are not really separated in a such a bounded way, although the model represents their interactivity by the spheres’ overlap. By contrast, the latest physics would have us understand their thorough “entanglement” rather than any kind of compartmentalization (Laszlo 2003; Wolff & Haselhurst 2005). This structural coupling of the two domains is the universal tango at the highest known scale of dynamics and analysis.

Laszlo lays out the virtual domain’s intimate role everything, which includes individual and social change and development. This article shines only a little light on that role through a last illustration from its case, which briefly recapitulates the overall tango. Where did my sudden insight come from, after my internship and subsequent crusade to understand what was happening? What conditions enabled my crusade to begin? During the internship, I was not raising the question, thus I was not receptive to learning where I had hidden my own secret. I was structurally coupled in a very unsatisfying system that I didn’t see a way out of if I wanted to complete the program. Once it was over, I was “free” again and wanted to learn more about that tango. My searching oscillations processed all the information that seemed available to me, and accumulated many dead ends of possible explanations.…then, Wham! There the insight was, in an instant, and I knew it was true, and it resulted in a new structure of understanding in me. I had to get to the point of looking for what I had parked on Saturn to understand the missing part of the reciprocal dynamic: taking care of me *by* taking care of my supervisor. One of the virtual domain’s functions is storing what we park on Saturn (in the form of their wave functions, like attractors). Once I was finally open to reclaiming it, I could “attract it back home.” This is because, as Laszlo describes, each individual act, thought, etc., generates its own wave function (an expression of its attractor dynamics) and these attractors’ “records” reside in the universal and cumulative “memory” which is the virtual domain.

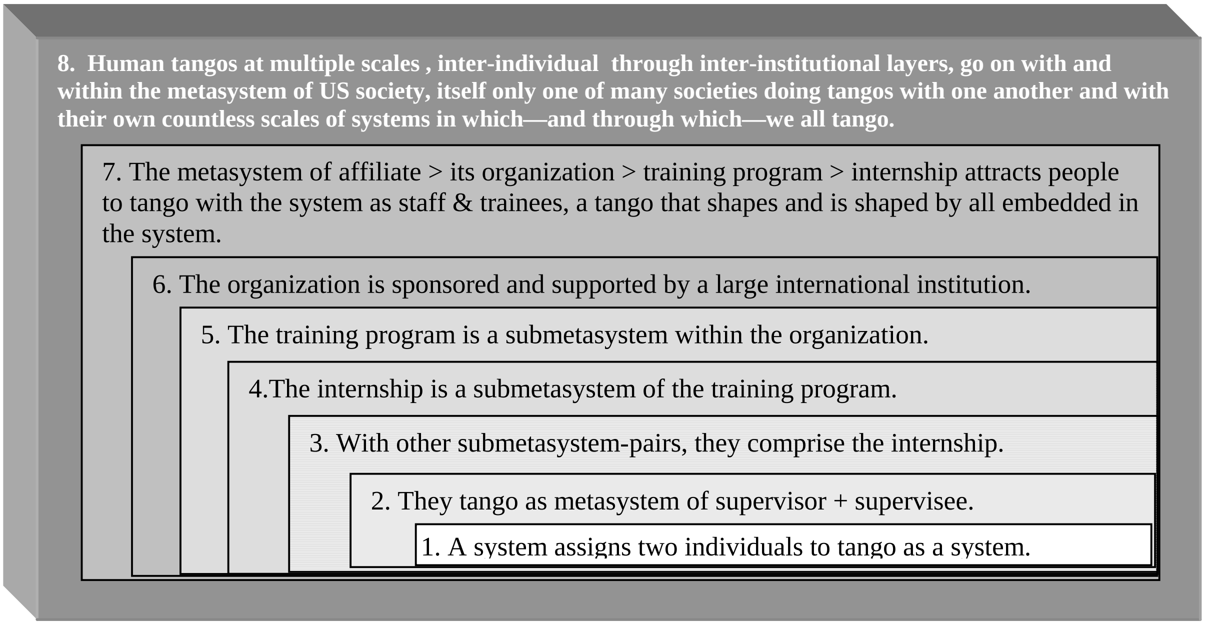
---

[16] e.g., wave function, wave interference pattern, scalar field, and others

As Laszlo suggests, there is much more we can understand about change and development in the manifest domain when we understand its tango with the virtual. I believe these contemporary physicists' and philosophers' work has major implications for how we understand many kinds of connections, how we construct our beliefs, how we understand more about the "black box" of the tango, and for practical applications of this integral process theory. Wrapping up this discussion at the universal scale, Laszlo (2003) explains these domains' tango in the same terms as the systems discussed earlier, in "a two-way process" (74): "the two domains evolve in reciprocal interaction" (106-107) establishing the template for needing two to tango and creating something new by virtue of doing the dance in the first place.

Scaling The Model's Environmental Spheres to Applications

The fractal nature of this process theory derives from the fractal scales of the tango it describes. Thus, the environmental spheres that dance with a system, metasystem, or group of metasystems will be different depending on the scale of attention, the context giving rise to a particular set of inquiries, and users' purpose(s) for exploring past, current, and/or potential dynamics.[17] Figure 8 illustrates the nesting of systemic tangos. It shows, using the case example, that tangos don't exist in isolated orbits any more than we do. They *are* the activity throughout and among systems related at different scales.



8. Human tangos at multiple scales , inter-individual through inter-institutional layers, go on with and within the metasystem of US society, itself only one of many societies doing tangos with one another and with their own countless scales of systems in which—and through which—we all tango.
7. The metasystem of affiliate > its organization > training program > internship attracts people to tango with the system as staff & trainees, a tango that shapes and is shaped by all embedded in the system.
6. The organization is sponsored and supported by a large international institution.
5. The training program is a submetasystem within the organization.
4.The internship is a submetasystem of the training program.
3. With other submetasystem-pairs, they comprise the internship.
2. They tango as metasystem of supervisor + supervisee.
1. A system assigns two individuals to tango as a system.

Figure 8: A partial model of the metasystemic setting of a supervisor-supervisee tango.

---

[17] Purposes may be as varied as the users that have them, and can include, e.g., self-reflexion, 1st, 2nd, and 3rd person action inquiry and analysis, design and design-evaluation of systemic intervention processes, identifying recursive adjustments needed in intervention strategies, evaluation of intervention processes' impacts, comparisons and assessments of other frameworks, etc..

Table 1 is a way to convey an example of elements the environmental spheres may include (described *generically* for example's sake) when the theory's premises are scaled to focus on an individual's self-reflexion process (focal systems at any scale are signified by the model's funnel). But the contents of the table need to be situated in the meta process of dynamic recursions that create something new, which enters into the recursive processes already underway (tangos): nothing here is static. Systemic environments that have done and are currently doing tangos (∝)[18] with the system(s) getting our focus, are recursively placed in relationship with the environmental elements (∞) the system perceives as available to tango with.

Table 1: Example of Environmental Elements Scaled to a Specific Focus

Environmental Sphere ∝ ***Have done or currently doing***	**With Focus On System Of:**	**Environmental Sphere β** ***Perceived as available***
Pre-existing, developing, or to-be-developed self-awareness of: ~ personal & social history, including nuclear family's and larger culture's shaping influences, past & currently held belief systems & coping mechanisms ~ felt constraints of behaviors and projections embedded in culture of relevant adjacent systems, ~ current triggers giving rise to reflexion ~ operating assumptions in context of triggers ~ etc.	 An individual's self-reflexion at any given time	~ *Perceptions and assumptions (i.e., the stories I tell my self)* of what exists and what is at stake beneath current triggers in the layers of systems in my environment, and these in relation to: ~ the meanings assigned to triggers ~ perceived environmental constraints on responses ~ perceptions of current capacities to tango ~ existing or potential support systems for new tangos ~ etc.

Summarizing The Process

This outline of a process theory of human dynamics distills a universal pattern down to five premises about its integrated processes to help us understand what goes on in the "black boxes" of individual and social processes at all scales. An important caveat is in order, too, with respect to the model: it is a *static* representation, offered via a limited medium, of *integrated not separate* processes taking place in *multi-dimensional environments over time,* which further *develop in time* by virtue of their interactive processes. Thus, the environmental spheres, the something new/learning sphere, the arrows, the funnel, the starburst, and Saturn and its shadow, are merely icons for the dynamic realities they signify.

As a whole, the aim of this presentation is to make the following interdependent ideas accessible to a wide audience.

---

[18] i.e., have been and currently are *structurally coupled*

- Premise 1, *It takes (at least) two (of something) to tango,* reminds us we cannot regard any individual or system of any kind as isolated in its own orbit, but rather seek out where the reciprocity dynamics are happening, and expect to find layers of them, like ripple effect interactions.
- Premise 2, *Whatever we don't tango with directly (but could), we put "out there,"* has significant implications. It reminds us we need to learn how to recognize projections, to keep an eye out for those that get parked on Saturn, to be alert to look for and reclaim them, and consider the conditions and potentials for projection dynamics in all our human undertakings. It highlights projection because it seems little-known or recognized outside the field of psychology, even though it plays phenomenal roles wherever human beings are concerned. If this premise gained traction, supportive human development methods that help people and societies recognize and reclaim their projections, along with the creation of healthier holding environments so fewer projections develop, might become higher on social change agendas.
- Premise 3, *There are limits to what we can tango with, and they diminish as we develop,* calls our attention to learning about and applying some basic understandings of structural limits germane to human and social functioning. The adult developmental psychology and transformative learning fields, which are as instrumental in this premise as complexity sciences, demonstrate their own limits in various ways, yet they are some we need to keep referring to, developing further, and integrating with other fields of research and practice.
- Premise 4, *There are common dynamic processes involved in dancing the tango,* encourages us to learn how to adjust our zoom lenses appropriately to look for and notice the dynamics going on all the time. It encourages us to decenter our attention enough to notice fractal patterns that can help us transfer our learning about how things work in black boxes at many human scales. It gives us some ways to start noticing our own "inner" dynamics, which can help us discover our own projections, assumptions, etc. This premise can help us make sense of how these dynamics affect what we want to learn, understand, or support, because the processes *are* what comprises whatever we consider our focus. Nothing is standing still inside the black boxes.
- Premise 5, *Something new emerges from each and every tango,* emphasizes the massive co-creative learning laboratories in which, with which, and as which we exist. It reminds us we need to find ways to identify and consider the complex range of environments interacting and/or coupled with anything we study. It challenges us to take a dynamic, processually-integrated approach to all phenomena, because all phenomena are dynamic processes in an ongoing pattern of co-creative evolution.

Conclusion

If Kelso is right, that everybody knows the world is made up of processes from which patterns emerge, but we seldom give pause to what this means, I hope this article is an opportunity to give pause. I have shared what this means to me, and what I believe it could mean for others. I also believe this theory fills a void because it transcends boundaries of specific fields of study and practice, and offers a synthesis of some of their essential knowledge to general audiences. It illuminates the process dynamics that co-construct the dialectical meta pattern of development itself, and integrates "the stages of" development with "the process of" development. It places projections in the forefront of attention as some of our key individual and collective tango partners and integrates them with system dynamics. As a transdisciplinary distillation, the theory puts a tool of developmental process analysis into the hands of people who want to understand and use what goes on in the "black box" of human dynamics.

As an experiment in distilling a lot of information that I, and others, can refer to and further develop, I have made my best effort to keep this introduction as accessible and accurate as possible. I do not know if I struck a useful balance, and I welcome suggestions for improving the theory's structure and integrity, its alignment with lived experience and the bodies of knowledge that inform it, and its usefulness. I am also eager to both test the sufficiency and deepen the explication of the premises, and I hope others will participate in that discourse.

At the level of application, I hope it fosters new understandings to support holistic inquiry into, analysis of, and action on a wide array of complex individual and socio-political issues we need to address across the planet. And I especially hope it contributes to efforts to explore, discuss, notice, articulate, and integrate the significance of interrelated dynamic patterns doing their tangos all around us and within us. These are my hopes, and although the uni-directional language of this writing has its limitation when the subject is *process* dynamics, we can engage in the tango of discourse at an experiential learning level and watch our new tangos unfold.

> *Language was never invented by anyone only to take in an outside world. Therefore, it cannot be used as a tool to reveal that world. Rather, it is by languaging that the act of knowing, in the behavioral coordination which is language, brings forth a world. …We find ourselves in this co-ontogenic coupling, not as a preexisting reference nor in reference to an origin, but as an ongoing transformation in the becoming of the linguistic world that we build with other human beings.*

Timely and Transforming Leadership Inquiry and Action: Toward Triple-loop Awareness

Anne Starr and Bill Torbert

Abstract: Drawing from situations in business, art, leadership education, and home life, this essay experiments with diverse ways to communicate the experience of triple-loop awareness. Contrasting it with single- and double-loop feedback in a person's awareness, the triple-loop supposedly affords the capacity to be fully present and exercise re-visioning, frame-changing timely leadership. The essay presents an encompassing theory of time and of its relationship with our own capacity for awareness. The experiment concludes with the reminder to readers that a first reading is like walking around the base of a mountain. The authors invite readers to try out one of the uphill paths of being with these experiments with a different kind of attention.

Key words: action-logic, awareness, inquiry, leadership, learning, re-visioning, timely action, theory of time, transformation, triple-loop

Introduction

This essay consists of a number of qualitatively different example-experiments to communicate the experience of triple-loop awareness, which supposedly gives participants in any social process the capacity to be fully present and to exercise re-visioning, frame-changing leadership in a timely fashion.

In order to begin displaying and playing with the distinctions and relationships among single-, double-, and triple-loop inquiry and action, the first several mini-essays are portraits of particular situations in business, art, leadership education, and home life. The final experiments occur in the course of presenting a more encompassing theory of time itself.

Our aim is to point toward the qualities of triple-loop awareness, even though we will also claim that the experience of triple-loop awareness is always more than thought or words. We hope to illustrate this experience vividly enough to interest you in the new freedom, mutuality, power and efficacy such awareness-in-action promises.

Overall, this essay will, of course, interweave us, the authors, and you our readers, through the resonances among all of these example-experiments and your own experiments with your attention as you read and amidst your other activities. Initially, of course, you may find yourself reading in the habitual linear sequence of the journal layout, perhaps doing some incremental, single-loop learning about the concepts discussed.

Eventually, if you wish, you may choose how to approach the article more playfully, weaving your attention back and forth among the portraits, seeking to encompass a whole new pattern of thought or to find just what this approach reconstructs about your way of thinking and acting.

SOME RIGHTS RESERVED

This may possibly catalyze (the beginning or acceleration of) a longer-term double-loop change in your thinking-in-action (or action-logic).

…Or perhaps, you may find yourself playing with the very attention you are using during this reading (in one exercise we will explicitly ask you to do this) – thus possibly experiencing what we call triple-loop inquiry and awareness as you read.

Brief Illustrations of Triple-loop Inquiry and Awareness in Action in an MBA Leadership Workshop

In the closing two minutes of an MBA Leadership Workshop on a February evening of 2005, a student says, “We’re beginning to get the idea of single-loop learning, where you see you didn’t get the result you wanted during a conversation, or in hitting the nail you’re trying to drive into a beam, so you make little corrective changes in your way of talking or listening or hammering, and sometimes you pretty quickly get the result you were hoping for. Several of us have told good stories of just listening a little more carefully and then asking a question about what the other’s saying, and feeling the whole ‘weather’ of that relationship change…”

“And I think a lot of us have a feel for double-loop learning too (and why it’s less usual, but more important for a good leader to be able to do), where sometimes you realize the wood’s so hard you’d better switch to a screwdriver and screw or, say, change what result you’re even trying to get in your conversation. So, those are starting to make a little sense…”

“But what’s this triple-loop idea that – whether in our own 1st-person awareness, or in a 2nd-person conversation within a team, or in a much larger 3rd-person social organizing process – we can sometimes change, not just our specific actions, and not even just our overall strategies, but also (and somehow, supposedly most powerful of all) our very present awareness so that we feel our own presence and that of everything around us?” (pause, before student continues)

“…Actually, our consultant, Grace, gave our Learning Team a good example of single-, double-, and triple-loop learning tonight, but we still can’t see how the triple-loop part works. She pointed out that a room temperature thermostat is built to permit the occupants to set a limit such that the furnace then turns off or on at the limit, making repeated single-loop changes from off to on or vice versa at that limit.”

“Of course, the thermostat is also built to permit occupants to change the limits, and she said that’s an example of a double-loop change -- changing the parameters.”

“When we asked her what triple-loop change would be in that example, she said triple-loop change is when, in February in Boston, an occupant blows a gasket and flies to Costa Rica for a week. (Laughter from the class) But, you know, like how are we supposed to do something like that at work in the middle of the day?”

The instructor pauses, surveying the class, and nods to one member who looks like excited words are about to emerge. She says she thinks she’s recognized a triple-loop awareness generating phenomenon on a relatively large social scale, as she’s been listening. She speaks of being visually ravished by some e-pics her sister in New York City has sent her of the Christos’ Orange Gates installation in Central Park.

“It’s taken 26 years since conception to get done,” volunteers another student, “And it’s only up for two weeks before they take all 7,500 gates and orange flags down again.”

“It’s got people from all over the country coming,” said another. “Even Europeans.”

"And," the original speaker pipes in again, "I read where they say the biggest miracle of all is that it's getting millions of New Yorkers to wake up with a goofy smile on their faces and rediscover their center. Central Park seen as though for the first time. A kind of "waking up" where you and the phenomenon become unusually present to one another, passing through our perceptual and conceptual filters with less distortion and more wonder than ususal. Don't you think that, after they come down, those orange gates may wake a few of them up again later by their very absence? Are they powerful enough to portend a new period of hope after the nightmare of 9/11?"

"Maybe the Orange Gates are a good example of all the preparation that can go into a few moments of truly timely action on a spiritual/historical scale," the instructor adds weightily. "Think of how short a time it took for Socrates to have his final inquiring conversation with his friends before ending his life by drinking the hemlock, yet how long that event has been re-awakening inquiry within Western civilization. Do you think the flavor of the Orange Gates will inspire re-awakening inquiry for as long as that? In the meantime, we still have the question about how to generate this kind of experience in the middle of a work day. Right now, it seems to me, the timely action is to end class. Can we do so without ending this fresh feeling of inquiry-in-action?"

Definition, Figure, Mathematical Analogy, and Experiential Test

During the following class, the instructor offers a number of scholarly, definitional statements about single-, double-, and triple-loop awareness, such as:

> First-order change is incremental, involving behavioral adjustments. …Second-order change refers to change in cognitive frameworks underlying the organization's activities… Third-order change …give(s) organization members the opportunity to transcend schemata (and to) recognize how this schema and all schemata limit as well as guide understanding. …Third-order change… presumes experience that is transconceptual. (Bartunek & Moch, 1994, 24-25)

Translating, he explains that triple-loop awareness re-presents a change in consciousness. It is the simultaneous awareness of all 4 territories of experience – of the outside world, one's own behavior, one's own feelings and thoughts, and at the same time, a kind of witnessing of all this. It can be called presencing (Senge et al, 2004). Triple loop awareness occurs in any moment when there's an attention distinct from the mental thinking, from the physical sensing, and from the objects of perception, infusing them all with an immediacy that is at once passionate, dispassionate, and compassionate. You're more likely to have these experiences when you put yourself in a position where you're on the edge of your known reality – on the not-necessarily-comfortable threshold between the known and the unknown. The instructor also offers the following skeletal illustration of single-, double-, and triple-loop feedback to go with the definition (see Figure 1).

The instructor suggests that objects in the external world are solid, earth-like, distinguishable and countable in interval/ratio terms (how many chairs in the room, how many dollars in my wallet, how many apple pies made). By contrast, the world of sensations and behaviors is describable and enactable in liquid, moving, ordinal, sequential terms (to cook a pie, first you do this, then that). The world of thought and strategy functions in airy, symbolic, nominal, relational, systems terms (e.g. a conceptual map). And the world of attention engages us with the entire aesthetic continuum from the fire-like, noumenal, non-dual origin of the empty light of attention itself, through our nominal categories of thought into the ordinal priority and sequence of our actions, to the interval accounting of the results we achieve.

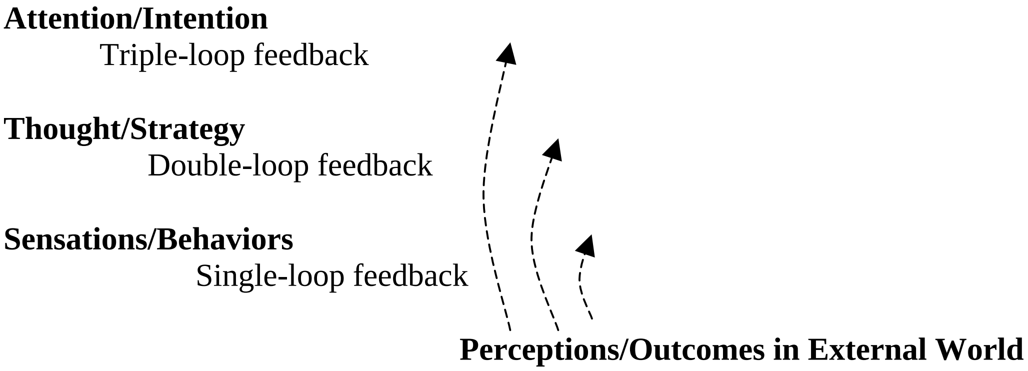

Figure 1: Single-, Double-, and Triple-Loop Feedback Within a Given Person's Awareness

In this context, the instructor offers the class what he calls a first-person experiment in generating triple-loop transconceptual, noumenal experience. He hands out single sheets of paper with the following instructions and asks everyone to spend the next three minutes listening to themselves "playing" silently with its suggestions, as we now suggest our readers do:

0. Zero. Origin. Noumenon.

> *Imagine that you are present in the present… that you can feel your own presence and other presences around you now…*
>
> *How do you "imagine" this?*
>
> *Are you merely thinking about these words as you read, or are you actually trying to feel yourself from the inside, becoming more aware of how your body feels now?*
>
> *And, as for the other presences around you, are you becoming more aware, not just of the meaning of these words as you read, but also of their physical presence as ciphers on this page?*
>
> *And the other people around you or the chair you're sitting on? How are you feeling their presences?*
>
> *How does this waking up to your own and others' presence in the present feel?*
>
> *How are you doing it?*
>
> *Is "doing it" changing the pace and the way you read?*
>
> *Can you "keep doing it" if you close your eyes?*
>
> *Or are you "just reading" again?*

Gleaned from an On-line Community of Practice Conversation among Developmental Consultants

Continuing our lightning-quick switches of frame, we turn from passionate, physical illustrations of triple-loop awareness (thermostats and orange gates) and from dispassionate intellectual illustrations of triple-loop experience (definitions, models, and an experiment with the mathematics of experience) to a compassionate, emotional illustration of how a professional organizational consultant, executive coach, or couples therapist can listen to clients. This statement was offered by Steve March in an e-mail conversation among a group of professionals dedicated to learning more about "integral theory and practice."

"I can *listen for clients' thematic patterns or patterns of action* during the meeting and propose or enact alternative patterns. This sort of listening and intervention can generate some important single-loop learnings on their part that can help clients improve their situation and the effectiveness of their interactions."

"A second more subtle and more difficult way I can listen to clients is to *listen to their way of listening* – in particular to what they *aren't* listening to. From this kind of listening I may suggest and try out with them a whole new practice that can help them make a double-loop change in their action-logic and embody that change in their way of listening."

"A third way of listening is to hear both of the levels already mentioned and at the same time to listen to my listening of the client's listening. How is the client showing up in my total experience? What am I feeling – emotionally and somatically? How am I being triggered? Who am I being such that this is the client I experience? I find, more and more, that this last question orients the unfoldment of my coaching."

Single-, Double-, and Triple-Loop Learning Interweaving in the Same Event

Single-, double-, and triple-loop learning may all occur in the course of the same momentary experience. For example,

> *"I've been talking and fighting and weeping with my wife all night long and into the morning hours, trying gently and patiently to reassure her that, despite whatever vibes she thought she saw between me and another (also married) woman at the other end of a long dinner table from where she was seated when we dined at our friends yesterday evening, I do love her and have no intention of leaving her.*
>
> *"As the morning continues without resolution, beyond exhausted, I remember a friend once saying that if all the different things you're trying aren't working, you should try the last thing you would ever think to do in this situation (thus, freeing yourself from the grip of your false assumptions).*
>
> *"Right now, that would mean getting angry at my wife. I can't imagine how that would reassure her, nor can I imagine what I have to be angry about. Then I remember that I have recently been teased about never getting angry. Maybe I can never imagine why I should be angry, but maybe I actually am angry without realizing it. Maybe I am rationalizing away an anger I'm not letting myself feel.*
>
> *"I realize intellectually that I may be at my assumptive limit. And I'm certainly exhausted – at my physical/emotional limits. So, not even knowing what I will say, I start*

> *making an angry roaring sound, and, to my surprise, hear myself yelling at her that she doesn't trust me and my love for her. That feels totally true to me. She immediately quiets down, begins to weep in a different way, as do I, and we're out of the cycle."*

Here, the speaker finally accepts the single-loop feedback that he is not reaching his goal of reassuring his wife. He next remembers a different, rationally preposterous strategy that is outside his current action-logic (double-loop feedback). He begins to rationalize about the strategy rather than acting on it, then sees that that's what he's doing (triple-loop feedback that changes his awareness). He then acts in a way that validates the single-loop learning by achieving the original goal, as well as in a way that validates the double-loop learning by the very uniqueness-for-him of the action, and that continues the triple-loop learning for a few moments of spacious high wonderment, seeing himself seeing, hearing himself speaking, and feeling the transformative alchemy work through them both.

Interweaving a Theory of Time with a Theory of Developing Awareness of Time

In recent work (Chandler & Torbert, 2003; Torbert, 1991; Torbert & Associates, 2004), a group of our colleagues have been highlighting a three-dimensional theory of time (and this theory is also either implicit or explicit in a number of other works related to quantum physics and consciousness research [e.g. Priestley, 1964; Malin, 2001; Purser & Petranker, 2003; Senge et al, 2004]). As we will see below, developmental theory traces the path by which people can come 1) to interweave single-, double-, and triple-loop awareness; 2) to experience the three dimensions of time (or the six dimensions of space/time; and 3) to engage in powerful, vulnerable, transforming, and timely leadership action.

One of the basic ideas of the three-dimensional theory of time-experiencing is that we are ordinarily 0-dimensional time beings, altogether time-oblivious (e.g. when engaged in a repetitive task, when driving and daydreaming, when enthralled by what we are reading, or when asleep). In addition, we are episodically 1-dimensional time beings, aware of linear chronological time (e.g. when waiting impatiently for someone who's late, or when rushing to meet a deadline). These may be named zero-dimensional time-awareness and one-dimensional time-awareness.

In its most sophisticated forms, one-dimensional time-awareness can be cultivated into an awareness of psychological and historical patterns that inform current actions (this type of sophistication is found also in the historical theories of evolution and development that have characterized both the social and natural sciences during the 20th century).

One-dimensional time awareness of sequential passing time permits us potentially to act, then identify a gap between act and intended outcome, then adjust one's action, and achieve one's goal (maybe), thus doing single-loop learning. Developmental theory and research (see Table 1) suggest that only a minority of managers and executives develop to the Achiever action-logic where they are capable of reliable single-loop

Table 1: Seven Leadership Action-Logics (adapted from Rooke & Torbert "Seven Transformations of Leadership" *Harvard Business Review* April 2005, with permission)

Action Logics	% of 4,310 research sample profiling at this action logic	**Characteristics**	**Strengths**
Opportunist	**5%**	*Wins any way possible.* Self-oriented, manipulative, "might makes right." Masters the outside world.	Good in emergencies or brief sales opportunities.
Diplomat	**12%**	*Avoids overt conflict.* Desperately wants to belong. Masters own behavior to fit group norms	Good as supportive glue within an office.
Expert	**38%**	*Rules by logic and expertise.* Always seeks the rational way. Masters some professional field of thought.	Good as an individual contributor.
Achiever	**30%**	*Meets strategic goals.* Juggles managerial duties and market demands. Uses single-loop feedback to work effectively with teams.	Well-suited to managerial roles; action and goal oriented.
Individualist	**10%**	*Interweaves competing personal and company action logics.* Encourages public reflection, creates unique structures to resolve gaps between strategy and performance.	Effective in venture and consulting roles.
Strategist	**4%**	*Generates organizational and personal transformation.* Exercises the power of mutual inquiry, vigilance, and vulnerability to generate double-loop change.	Effective as transformational leaders.
Alchemist	**1%**	*Inquires, listens, and acts.* Integrates material, social, and spiritual transformation through triple-loop awareness.	Good at generating society-wide transformation.

learning in the midst of ongoing action (Torbert & Associates, 2004; Rooke & Torbert, (2005). An even smaller percentage of adult professionals are measured as Strategists who reliably engage in double-loop learning and reliably generate successful developmental transformation (Rooke & Torbert, 1998). And only 1% transform to the Alchemist action-logic that is devoted to sustainable moment-to-moment triple-loop learning and awareness. Double- and triple-loop awareness introduce us to the second and third dimensions of time, which are hidden within durational or passing time.

The second dimension of time can be imagined geometrically as orthogonal to linear durational time from the past to the future, passing through the present. From the point of view of our ordinary (zero or one-dimensional) temporal awareness, the present is a vanishingly small instant that can never be grasped because it is past by the time that its sensations, thoughts and feelings register within us. Is there a different quality of awareness that permits a timeless, conscious experiencing of the present – a quality of awareness that permits us to live nowhere but the present… inhabiting the eternal present in all of its unfolding fullness… experiencing a sense of our own presence and of other presences around us even while remembering something, or focusing on a particular task, or imagining a possible future? When smelling a flower, or facing a sunset, or embracing (and being embraced by) a beloved, many of us are occasionally graced by contemplative moments of harmony and communion… a conscious experiencing of presence-sensitivity-receptivity in what feels like an "eternal now" (in Latin this was called the "Nunc Stans," the "Standing Now"). Similarly, we may experience vivid moments of disharmony as when we "see" that our practice contradicts our own espoused principle. But, paradoxically, these eternal moments of "time out of time" usually soon fade.

A third dimension of time can again be imagined as orthogonal (the Z axis) to the plane defined by chronological time (X axis) and eternity (Y axis). The three-dimensional "volume" of time can be imagined as holding all possibilities, all the potentialities of the future and the still-hidden meanings of the past, some of which emerge into the present (become act-ualized) and then pass into linear, historical time, through a translation process that quantum physics now describes as a "quantum collapse" (Ho, 2001; Malin, 2001).

> What is actual… consists of both objects and subjects in a dance, or flow. Each new subject is constituted in part by antecedent actualities, but each new moment of experience, in addition to its physical constituents, is also a *creative subject* which exercises its freedom and creativity to unify *in the moment* its constituent completed moments of experience. Each object is an expired experience…; *and then* these objects provide the raw material for subsequent subjects… And so the cycle proceeds from subject to object to subject to object (de Quincey, 1999, 99).

Is there really a different quality of awareness that goes beyond a deepened sense of presence in the present to sensing oneself as a creative subject actively participating in midwifing an emerging future (Senge et al, 2004)? As a first taste, we offer the following meditation written in January 2005 by Maria, a woman in her thirties, who had been a member of a spiritual group seeking such heightened awareness, but had recently recognized that it was fraudulent and that she was being manipulated into donating a large proportion of her time and money to an organization in which she shared no control. Now faced with questions of love, marriage, and faith tradition (she Catholic, her fiancé Islamic), she writes:

I'm tired of pretending
    To believe what I don't
I'm tired of pretending
    I'll do what I won't.
I'm tired of pretending
    I want what I "ought"

I'm tired of pretending
  To be what I'm not.

I'm ready to see
  What I previously couldn't.
I'm ready to want
  What I want, though I "shouldn't."
I'm ready for answers
  That come from me.
I'm ready, so ready
  To finally be free.

Here, the writer seems very much "on the edge" of her known reality – on the not-necessarily-comfortable threshold between the known and the unknown, between the present and the future. Is she really ready as she says she is? In the passion, dispassion, and compassion (for herself) of writing this meditation, she may have momentarily been truly experiencing a birthing of triple-loop awareness. Yet her previous "pretending" had surely not all been intentional pretending. Often, no doubt, she had been convinced at the time that she wanted what she "ought." Has the experiential awareness of simultaneous completion with the past and emptiness of the future (not more of the same) lasted beyond the writing of the meditation? Does it return often? Or has the memory of the writing replaced her live experiencing of presence on the verge of the volume of possibility?

The following story from an autobiographical course paper illustrates a longer visit to this world of surprising presencing, followed by the writer's reflections on the aftermath:

> *My older brother became ill, a reality almost impossible for me to accept as he was amongst my greatest life allies.*
>
> *I visited him in Mill Valley and when there saw his terrible degradation. He didn't recognize me, mistaking me for a nurse though I had called to announce my arrival only 30 minutes before. I followed him into his office where he announced authoritatively, looking at his calendar, "My sister is due here at 11:00." Self-medicating, he had frightening overdoses with alarming falls and dangerous accidents in the kitchen. His pitifully thin body was bruised and cut where he had hurt himself.*
>
> *Toward the end of my short visit I sat with a circle of his close friends, the hospice nurse and him. I was stunned and devastated, uncertain of myself. His friends were half-playfully chastising him, complaining about how difficult he was and how they worried about him, which he bore with his usual blend of humor, charism and humility. In the midst of hearing all this, the thought came to me: I will come back to live with him and take care of him. I said so right then and the clarity of my statement and power of my intention were like the quiet birth of a new reality.*
>
> *I went back to Boston and moved as if watching myself from above. I did not know how I would do it but knew I would with a certainty that was as though it were already true. My boss, who normally complained if I wanted to take any time away from work, didn't even question me. I seemingly effortlessly found someone to live in my house indefinitely. Two technical people emerged and with grace and patience, connected me*

> *remotely to what I needed for work. Twelve days after I returned from San Francisco, I flew back there to live.*
>
> *Thus began five of the most intimate, terrifying, hilarious, and grief stricken months of my life. I only worked when my brother didn't need me and learned a new trust that time would cooperate with what had to be done. As it turned out those five months were incredibly prolific and financially rewarding, and I found I liked my work more than ever before. I loved my brother's created extended family and with their help learned how to take care of him. In some ways this was my most satisfying creation: it was instantaneous in conception and fell into place like magic - its heart energy so strong and its intention so clear, nothing would stop it. It felt to me like a magician time, where the conception is the creation and time folds to meet any contingency.*
>
> Quite apart from the profound personal experience that this was for me, it was also an unprecedented experience of a new kind of power. Being a constitutional worrywart, I was accustomed to thinking with limitation – seeing the barriers (in the "real" world) associated with attaining my desires (in "here") as overwhelming. The emotional shock of this situation gave me a power and clarity I had not experienced before. Instead of seeing limitation, I saw only my intention and knew there were any number of ways it would be met. My desires and the real world were interacting in real time (the present). I never forced a connection or answer, but instead *knew* that things would fall into place. This felt physically like operating from above myself with infinite flexibility to play/enact in the world "below". I should also say that I have not summoned this kind of power since then – unfortunately, not even to write this paper (Anonymous, 2004, with permission).

Here, we hear of a prolonged experience of a purportedly altered state of consciousness generated in part, it certainly seems, by the emotional shock this woman experienced in the face of her brother's imminent death and in part by defining for herself a very practical role to play that kept her entrained in the ongoing daily presence of this most dramatic of human transformations. While it was going on it gave her an unprecedented freedom of action and self-determination. But as she says, this extraordinary time also ended, and did not leave her with a reliable capacity to recreate that state.

Is it even conceivable that there is a spiritual/political/scientific/business inquiry and practice aimed at generating an ongoing triple-loop awareness that transforms outcomes through changing the quality of one's actions, of one's action-logics, and of one's very attention? To what degree can what kind of a spiritual community of inquiry support one's efforts toward a trans-conceptual awareness that can host all three dimensions of time – 1) the "line" of mundane, durational activity; 2) the archetypal, eternal, fractal "circles" of time that durational activity embodies; and 3) the "volume" of possibilities, from which spontaneous, imp-possible, trickster-ish violations of past pattern are drawn? These questions carry us beyond the boundary of this short article. Let us instead contemplate one more example of a particular business leader who seems to integrate action and inquiry on an ongoing basis.

Warren Buffett, an Exemplar of Triple-loop Awareness and Action?

For the many who believe that material success in business and life requires opportunistic cutting of corners, it may come as a surprise that we will tout one of the richest men alive as an intuitive practitioner of single-, double-, and triple-loop learning for whom integrity, mutuality, sustainability, and inquiry are truly primary in his life and work. We are speaking of none other than the Oracle of Omaha, investor Warren Buffett. Buffett's entire theory of value-based investing requires constant inquiry into specific companies, as well as mutual inquiry with the leadership of those companies, rather than formulaic responses to the stock market or particular industries. His approach also relies profoundly on self-oriented inquiry, in order to know the edges of what he calls one's "circle of competence" as precisely as possible and not make investments outside it.

Buffett approaches the companies he invests in as partners he wishes to relate to over the longest possible term, rather than as subordinates he can dominate or fleece in the short-term. He does the same with his shareholders at Berkshire Hathaway annual meetings, with reporters, and with business students. Rather than pontificating, he turns each encounter into an opportunity for open inquiry and gains trust through his self-deprecating humor and honesty. His basic principle of conversation and political practice is simple: "Never lie under any circumstances." (The *principle* is simple; *living up to it* is a complex work of art.) Or, as his friend Charlie Munger puts it, "One of the reasons Warren is so cheerful is he doesn't have to remember his lines."

But, the reader may ask, in what ways is Buffett transformational? He appears to have done much the same things his entire adult life. He has lived in the same home and eaten the same junk foods most of that time. Early on, he created a financial vehicle to give the vast preponderance of his fortune away and has stuck with it. And most of his close friends claim they've never known anyone who remains more the same.

True (although the very idea [not to mention the actual practice] of giving your fortune away before you've even earned it is a wee bit unusual and would require a huge personal transformation for many a businessperson). Yet it is also true that Warren's wife Suzie brought him out of his introverted self in a new way and taught him how to make friends across wide differences during his twenties and thirties. He's also changed from the Republican to the Democratic Party, a pretty unusual move. And in the past decade he's gone from being virtually a lone investor to being one of the largest employers in the US.

But perhaps the most striking, virtually instantaneous reversal of frame on a large scale that Buffett has accomplished occurred in 1991 when Shearson-Lehman fired its CEO as an ethics scandal broke. Buffett (a large shareholder) received a call early one Friday morning asking him to step in as interim CEO and try to rescue the company. By Sunday evening, he was closing in on choosing a permanent successor through an inquiry he had begun with senior management, and had met with the press for hours that afternoon, answering every question as honestly as possible. His presence, integrity, and collaborative inquiry transformed the credibility of the company almost instantly and it was saved.

And how about Warren's and Suzie's and Irene's act of transforming the notion of a romantic triangle? We usually imagine a romantic triangle as a temporary, unsustainable way of secretly cheating. But these three created a romantic triangle that was mutually honest, respectful, loving, publicly-acknowledged, and sustained until Suzie's recent death. Obviously, such an ongoing relationship is potentially susceptible to any number of jealousies and two-on-one power plays, unless all three persons continually enact each of the three couple relationships within the larger frame of concern for the unique triangular relationship as a whole. (If readers are interested in evidence for this characterization, or just in sheer inspiration, we recommend that you order a copy of the 2004 Charlie Rose PBS interview with Suzie Buffett only months before her death.)

A final indication, both humorous and serious, of Buffett's trans-egoic perspective on his activities is his final letter to his Berkshire Hathaway shareholders, which he has already written and which will be released the day after his death, continuing his frame-changing leadership. It begins, "Dear Shareholders, Yesterday I died. This is bad news for me but not for you…"

Conclusion

This essay has consisted of a number of qualitatively different experiments to communicate the experience of triple-loop awareness, which supposedly gives participants in any social process the capacity to be fully present and to exercise re-visioning, frame-changing leadership in a timely fashion. The examples have been drawn from particular situations in business, art, leadership education, and home life. We have also presented an encompassing theory of time itself and of its inextricable relationship with our own capacity for awareness.

If you have reached this point in the article after having read straight through it, please recall our admonition in the introduction that it is unlikely you will have yet achieved a satisfactory sense of comprehension, completion, and conclusion. Reading the article once through is like walking around the base of a mountain. Now, perhaps, your attention can try one of the uphill paths toward the peak of this little mountain of meaning (Daumal, 1974). What would it mean to play with the very attention we are exercising as we read, as we suggested in the introduction?

In other words, to what degree may it be possible to live, on an ongoing or many-times-a-day-returning basis, within in a six-dimensional horizon of conscious inquiry into the life and death of particular events, particular thought-episodes, and particular feelings, as well as of the sense of fractal patterns among them, not to mention the subjectively presencing origin toward whom our attention turneth when we seek through our winters and into our springs?

Good, Clever and Wise: A study of political meaning-making among integral change agents

Thomas Jordan in an Interview with Russ Volckmann

Abstract: Thomas Jordan discusses the intellectual and research foundations that have led to his creation of a consciousness development model. In interview research that he conducted among selected personnel in Swedish defense and security agencies, Jordan has focused on three key skill sets: consciousness skills, self-awareness and embeddedness or identification. From this he has identified seven characteristics that show up in various patterns among those he interviewed. The first three—good, clever, and wise—are key characteristics. The next four follow from them: curious, inventive, modest and handy. These show up in variable combinations among these integral change agents involved with promoting change within political institutions.

Key words: Integral, change agent, consciousness, skills, political, meaning-making.

Q: *While your work historically has been focused on conflict management, since about 1998 you've been writing about development and politics while drawing on diverse theoretical approaches to do that. We're going to be considering the work you're currently doing. As a way of starting us off, what brought you to this work?*

A: The research I'm finishing now is about integral change agents, primarily in governmental organizations. I tried to find individuals who make sense of themselves, their aims and their world in terms of what we technically would call late post-conventional meaning-making. These are people who are unusually aware, sophisticated in their understanding of causality and have a deep, personal engagement with some kind of existential values—values that serve the whole, rather than some partial interest.

I'm doing this research with project financing from the Swedish Emergency Management Agency. That means I am focusing on people who work with societal security issues in a very broad sense (see Table 1). Some of them work with defense policies and others with internal security, for example, addressing how we can prevent society from disintegrating into a situation where we have a lot of street violence. All of the people I have interviewed in this project are in some way engaged with issues involving how we keep a decent society.

Table 1: Positions of Those Interviewed

SOME RIGHTS RESERVED

Profiles of Interviewees	
Positions	**Total**
Officials and experts at ministries of the Swedish government	5
Senior officials in Swedish government agencies	5
Police officers in various functions	4
Officials with policy making and organizational development tasks, City Office of Gothenburg, Sweden's second largest city	2
High-ranking officer in the Swedish Armed Forces	1
Consultant working for the Swedish Armed Forces and Police	1
University professor	1
Total	19

Q: Is this a significant new step for you?

A: There is a very straight line from what I have been doing for the last 20 years or even more. I have always been rather obsessed with trying to understand why the world looks like it does and why things happen the way they do. I have a very deep interest in understanding the inequalities in the world and finding some way to work with reducing suffering.

I started out trying to understand the world through economics, economic geography and similar sciences. Then I moved to looking more at how human consciousness works and to use that as a perspective for understanding societal conflicts on various scales. I've spent a very long time getting familiar with and learning to use theories on adult development and consciousness development in order to make them into tools for understanding political development and processes of various kinds. Thus, it's quite natural that I end up working with these issues.

Q: As a way of laying a foundation it might be useful for us to take a look at what are those models and constructs that have been significant for the work you're doing now.

A: I've always been interested in psychology as a way of understanding how people behave in social interactions. In the mid '80's I read two books that turned my whole conceptual framework upside down. One of them was Stanislav Grof's *Realms of the Human Unconscious.* The other was Ken Wilber's *Up from Eden***.** They were very significant in different ways for the development of how I have been approaching these matters. Perhaps Wilber's book is more relevant to what I am doing today than Grof's.

The most important thing with Wilber's book was that it painted a vision of human history—cultural history, societal history—that focuses on the relationship between structures of human consciousness development on the one hand and societal systems, structures and cultures on the other hand. Reading that book gave me a key I had been looking for to understand politics. It started a process in which I quite systematically went to Wilber's theoretical sources.

I've focused mostly on the research-based sources. I've spent many years reading the research on adult development, ego development, consciousness development, and ego transcendence. In this very rich literature there are of course some researchers who have been more important to me than others. Among my favorites are Robert Kegan and the whole area of ego development psychology with Jane Loevinger, Lawrence Kohlberg, Michael Basseches, Robert Selman, Bill Torbert, Susann Cook-Greuter and a lot of other people.

So the research I have been influenced by has focused on cognitive development and ego development. I'm also very influenced by spiritual traditions, primarily Buddhism.

One very important person for me was Trungpa Rinpoche whose books I read early on. He influenced my thinking very much. I've been reading a lot of Buddhist literature, mainly Tibetan and Zen Buddhism, Thich Nhat Hahn, for example. Like Wilber, I find it very productive to make use of the Western traditions of empirical psychological research into meaning-making structures and Eastern traditions about how human consciousness actually works.

Q: *Has this resulted in your developing a framework for integrating these?*

A: Yes. I spent quite a lot of time trying to put together many different models and dimensions of consciousness development. Wilber talks about lines of development and tries to relate different models to each other by saying that they focus on different aspects of consciousness development. But Wilber has been quite reluctant to spell out details or delve into the more intricate aspects of how those different lines of development relate to each other and what it means when you look at them in an interrelated way.

It has been an important personal project for me to try to develop a conceptual framework for putting those different dimensions of consciousness development to work when I'm trying to understand such things as security policy reasoning or how people generally behave in various kinds of conflicts, like workplace conflicts.

What I have is not at all a finished framework, but I find it very productive to think about consciousness development in terms of three different aspects, three different approaches into the field. The first is related to what we could call *consciousness skills.* That is what the theories about cognitive development are very much about—for example the complexity in how you construct causality in the physical, social and psychological worlds. It is about such things as role-taking: what skills you have in imagining how differently other people think; or capacity to construct and use abstract, subtle and paradoxical concepts.

There are very many different models discussing various aspects of cognitive and consciousness skills, not only the cognitive part of it in a narrower sense, but also what is generally called emotional intelligence: how you can use your way of relating to people, use your empathy, using your tone of voice and such things in order to influence what happens in communication and relationships.

Q: *What do you mean by cognitive? We may tend to associate that with "intellectual" and it sounds like you're going beyond that.*

A: Cognition is not only discursive thinking, but also involves other types of mental representations and information processing, such as imaginal and symbolical processes. It includes the way you make images of things that happen, for example. It is about everything that goes on in your mind in terms of your thoughts about things, the way you make story lines out of what happens in your life, the way you think about things, the way you reason about cause and consequence and so on. So cognitive for me is really a very broad category and has a very broad spectrum of development as well.

When we look, for example, at Jane Loevinger's ego development theory and stages, we can see how—in the course of development—language becomes more and more differentiated. In early stages of ego development you have access to a very simple and crude repertoire of concepts and words in order to discern and describe inner states and what happens in the environment. Developing an increasingly differentiated repertoire of concepts and symbols is a key aspect of cognitive development. It allows a person to discern nuances, ambiguity and complexity.

Q: It has to do with the capacity to differentiate?

A: That's one important aspect of cognitive development, yes.

Q: So far, cognitive is about thought and the capacity to differentiate with greater complexity, as well as emotional intelligence. What would you add to that?

A: Cognitive processes include the whole imaginal realm of using non-verbal symbols and images. Academics may have a tendency to focus on rational thinking, but in understanding how people function in daily life we need to pay attention to how people make sense of events by creating stories. These stories make little use of logical analysis, but draw on metaphor, mythical themes, dramaturgical figures and so on.

Q: And what would you add to the arena of consciousness skills?

A: Unfortunately there is too little empirical research into development of skills in the realms of feeling, intuition, sensory-motor reflexes and pure action. We learn more by imitation than by intellectually understanding and many skills we use in highly purposeful ways cannot be articulated in discourse. So I hope we will see an expansion of knowledge about consciousness skills related to emotion, imagination, intuition, action, etc.

Q: Consciousness skills is the first aspect. What's the second one?

A: The second is *self-awareness.* I use the term self-awareness with a very specific meaning, in a very specific sense. I mean the capacity or presence you have in relation to your own on-going subjective processes. What's going on in yourself? I think this can be best understood if you are somewhat familiar with Robert Kegan's subject-object framework. He talks about the very important aspect of human development where you are able to take different things as objects for reflection, as objects for awareness.

Self-awareness means that you notice that you have certain patterns of thought operating in you. You can take your own thinking operations as an object of awareness. You can look at your patterns of thinking. You can reflect on those patterns. You are aware that those patterns happen in your mind. The same goes for other types of subjective processes such as emotion, the attitudes you develop toward other people, towards your wishes and cravings and so on—all the things that the spiritual traditions work with.

Q: Would it be fair to say that consciousness skills as you are describing them relate to our life conditions and self-awareness is their interiority or is there a more complex relationship between the two?

A: They are very strongly interrelated. The distinction is somewhat artificial, but if you look at skills and you look at the theories describing different kinds of consciousness skills, they always emphasize increasing complexity and increasing sophistication in those skills. But self-awareness has not very much to do with increasing complexity and increasing levels of sophistication, but more with actually noticing that certain things are going on in yourself. You are no longer a captive of your own subjective processes, but you can develop a witnessing ability. The witness self, which spiritual traditions talk a lot about, is the principle operating in self-awareness. You develop more and more of an ability to witness your own subjective processes.

That's central in understanding, for example, how people behave in conflicts. Some people are not really aware that what they feel towards another person is a process going on inside themselves. They tend to feel that when they dislike a person that is a direct consequence of that person having bad qualities. But persons who in a very clear way are aware of this process as going on inside themselves can differentiate between their own psychological processes and the inherent characteristics or the processes going on in other people.

I would say that skills have more to do with the level of capacity you have for understanding complex systems and so on, whereas self-awareness has more to do with your presence in relation to your own processes. In Buddhism and other spiritual traditions when you start meditating you start observing your thoughts, the mind streams going on in your own consciousness. That doesn't necessarily mean that when you can differentiate your witnessing ability from the cognitive processes going on in your mind, that you can look at the thoughts floating up in your mind and that those thoughts are very sophisticated. They can be quite simple.

Persons at a very simple level of cognitive development can develop a high level of self-awareness, but that doesn't mean that they automatically are particularly skilled in understanding complex systems of causation and so on. There is a point in differentiating between skills on the one hand and self-awareness on the other hand. They tell us very different things about how a person's consciousness operates. I think there are many monks in the Buddhist tradition, for example, who have very high levels of self-awareness, but not very high levels of sophistication in their consciousness skills. They weren't trained in sophisticated thinking operations. But since they know their thinking processes are subjective, they are perhaps not so inclined to be convinced that they already know everything, which is of course a great advantage.

Q: *What is the third area?*

A: The third I tend to call either *self-embeddedness* or perhaps a more accessible term: *identification.* The first two dimensions or aspects describe what you can do, but not what you *want* to do. Self-embeddedness includes those lines of development that have to do with what you find important, what you identify with, how you identify yourself. What kind of self image you have, what kind of value systems you are embedded in, what kind of morals you feel committed to and so on.

In the self-embeddedness aspect of consciousness development we find, for example, Robert Kegan's or parts of Jane Loevinger's ego development models. We also find models related to moral development or collective identifications. That's a very interesting aspect: what kind of collective you feel you are a part of. We also have Spiral Dynamics with the emphasis on value systems. What values do people identify with?

I think it's important to differentiate those three aspects of consciousness development, because no one of them can be reduced to the other.

Q: *As I understand the framework that you've put forth so far, you're suggesting that these three areas are useful ways to cluster lines of development and to begin to think about the relationships among lines of development, is that correct?*

A: Yes, exactly. They constitute a framework that may offer tools that can help us understand unique patterns of meaning-making. One of the criticisms I have about taking stage models too seriously—any of the different brands that are around—is that they may reduce our sense of the uniqueness among individuals or cultures. With a more open-ended framework defining different lines of development and formulating questions, rather than focusing on the definition of discrete stages, we can have much more openness towards understanding what is unique about meaning-making patterns of a certain individual or a certain group. And that's very valuable.

Q: *In one of your papers, you differentiate between idiographic and nomothetic approaches to research. Are you basically arguing for this framework to support an idiographic approach?*

A: I think nomothetic and idiographic approaches are necessary, but I feel that there has been too much emphasis on nomothetic approaches, that is approaches that try to develop theories that are universally valid and describe reality in, for example, a stage model. Idiographic approaches use theory in order to understand unique circumstances and unique individuals. I think that we need more of that if we want to be able to carry out really good empirical research on these matters.

Q: *The idiographic approach basically allows us to use theory to help us understand what is happening for an individual or in a current situation in some social system. Is that true?*

A: Yes.

Q: *By being able to use theory to help us create distinctions in a social system for ourselves and others we have an applied approach to creating change—well, first to creating meaning and presumably by creating meaning, then to creating change, be it the resolution of a conflict or the development of more capacity within a particular social system?*

A: Yes, that's how I see these things. I think that in order to be really useful for working with the real world our theoretical frameworks have to be very context sensitive. They have to be adaptable and flexible in order to make it possible to understand the variations and the nuances in what we encounter and identify what are the really relevant aspects of what is going on out there. If we who work with theoretical development in the integral paradigm want to be useful for a wider world we have to go in that direction—not only—but also in that direction.

Q: *Returning to these three elements or aspects in the framework you're using, you've also talked about the interplay among them, the relationships among them. I'm wondering if you have any construct or any framework for talking about that process, that dynamic?*

A: Not really. Only that I find it very productive to have these distinctions in the back of my mind when I interpret interviews, when I look for patterns in meaning-making of, for example, a political party or a group in a conflict—how they make sense of what is happening in their world. Then I find that this theoretical frame allows me to recognize the patterns operating in a very differentiated way. I have not, at least yet, tried to theorize very much about that in terms of a general theory about how these different aspects of development relate to each other. It might possibly be done, but I think we haven't come very far yet.

Q: *How do you use this framework to begin to talk about integral politics or to make meaning in looking at situations involving politics from an integral perspective?*

A: I've spent a lot of time looking into all those different theories about consciousness development in order to fashion tools for understanding societal processes, in particular conflicts of various kinds. I was invited to one of the early meetings at the Politics branch of the Integral Institute almost five years ago. I found it very interesting and productive to think about the concept of integral politics. What would integral politics be?

Some people regard integral politics as a kind of ideological framework that would replace existing ideologies by transcending them and integrating various kinds of values. I tend to think about integral politics not so much in terms of the content, the concrete opinions and policies, but rather in terms of the structure of meaning-making. I think even an integral community will have different political camps: integral conservatives, integral liberals, integral social democrats, etc. The key issues have to do with the ability to balance the spectrum from egocentric to world-centric concerns, the ability to perceive and handle systemic complexity and the capacity to reflect on the patterns of meaning-making.

Q: *This is how your framework is applied?*

A: Yes. One of the ideas that I had is that we shouldn't just try to develop a conception of integral politics by theoretical reasoning, by deducing integral politics out of some kind of basic principles. I found it attractive to use what we academics call an inductive approach, namely to search for people who have spontaneously developed a capacity for integral meaning-making and then study how these people think about politics. How do they think about their role in politics? How do they go about trying to change things? That has been an idea that has been with me for five or six years, but I didn't have the opportunity to do a project until two years ago.

Q: *And that's what you've been engaged in since?*

A: Yes, that has been one of the projects I've been carrying out for the last two years. What I could do at first was to explore meaning-making in Swedish defense and security policies. I also did a research project on how people think about what keeps the society decent, i.e., meaning-making in internal security policies. In the course of these two research projects, I had an opportunity to interview about sixty people in various positions in Swedish political and administrative organizations. I got to know quite a lot of people and to meet some very interesting individuals.

In the course of those projects, I thought I could recognize a group of very interesting individuals. I tried to look at them with a mind schooled by the theories I've been working with for a long time now. I thought I could discern certain patterns that fit quite well with certain aspects of consciousness development theory.

So, the background to this project is that I had an initial image of the existence of a group of interesting people active in Swedish authorities, government departments and other organizations. I wanted to have a closer look at them in order to learn how they think about what they're doing, how they define what they find engaging in what they do and how they go about trying to work for change in a complex society. This would be a way to learn about what integral politics might be in practice.

These are not people who have joined university courses in cognitive development theory or anything like that. They don't have a vocabulary for reflecting on and talking about themselves in that way. But they display many of the characteristics described by, for example, Torbert's model for ego development among leaders or Loevinger's, Kegan's and other theories. I devised a strategy for finding and interviewing such people in order to learn more and to use this material to develop a—perhaps I shouldn't say best practice model, but something like that. I want to assemble a portrait of how we can conceive of political change and political work as alternative politics or integral politics. That's what I'm deeply engaged in right now.

Q: *Before we go into the study itself in terms of the variables you were just talking about, can we go back to your identification and selection of these individuals? The way I'm interpreting what you are saying is that these are people that, when you talked with them, gave you some indication that they had developed to some higher capacities in the three areas of your framework having to do with consciousness skills, self-awareness skills and* *their relationship or levels of identification with what's important in their world, their value systems, their self-embeddedness, is that right?*

A: Yes.

Q: Were you able to identify the individuals that you thought might be valuable to talk with in this study because you intuitively picked this up or were there some specific things that helped you select the people that you would include in this study?

A: Well, I had some points to start from that I knew were important and that I could look for in people. So, for example, I looked for people who felt a personal engagement in some kind of world-centric values; that was one of the points. I also looked for people who had a certain kind of interest in complexity. They have a good understanding of complex reasons and interdependencies behind what happens and also a sense for complex consequences. That's not as common as you might think when you look at how people go about their tasks in organizations—commercial or governmental.

Q: Would this piece about complex consequences relate to moving past linear causality into systemic and meta-systemic causality?

A: Yes, exactly. That's exactly what I was after. And a third very important factor was what Wilber could call vision-logic, which I conceive of as the ability to perceive and understand systems of meaning-making—individual and collective systems of meaning-making. This involves people having an intuitive or explicit ability to understand that perspectives or systems of meaning-making are actually very important causes for how people act.

Some of the people I've found have a natural ability to recognize that a person acts in such and such way because they are identified with a certain self image, certain values or they have a certain way of reasoning about causality and so on. That has very, very important consequences for their attitudes towards other people. These are people who have a very low propensity for making enemies out of other people. Even though other people may act in ways they disapprove strongly, they see the underlying reasons for their behavior and, therefore, they don't blame people in the same way that many others would. But these are, of course, very, very complex issues we are going into now.

Q: Was there anything having to do with spirituality or morality that distinguished these people?

A: Few of these people actually talk about spirituality. A few of them do, but most of them don't.

Q: What meaning do you make of that?

A: I'm not sure of how I would define spirituality. You can have two quite different ways of looking at it. One definition of spirituality emphasizes the sense of being in connection with some kind of greater presence or power. It is a very feeling-oriented sense of spirituality. Another aspect of spirituality is more in terms of ego transcendence—you feel committed to a perspective that goes far beyond your own ego and your egoic needs and interests. For these people I'm studying, I think the second aspect is more pronounced and more important in understanding how they operate. These are not people who talk a lot about God or something like that, but some of them are in fact like Bodhisattvas…

Q: *How do you mean they're like Bodhisattvas?*

A: A Bodhisattva in the Buddhists world view is an enlightened person who has chosen to stay among humans and to work for other people's enlightenment and liberation from suffering. In particular, the last part is very relevant for many of these people. They have a very, very deep personal commitment to work for other people's liberation from suffering in various forms. This motivation is central to how these individuals choose to work, what kind of positions they look for, what kinds of organizations they belong to and what kinds of tasks they feel are important to engage in.

In a close-to-the-ground sense, these people are like Bodhisattvas. Maybe they don't wallow in cosmic consciousness and feel at one with the world soul and such things, but in a very sincere and personally grounded way they are deeply engaged in working for the good of the whole and working to alleviate human suffering. In that way I feel they quite closely fit into the image of the Bodhisattva.

Q: *Having selected the people that you were going to interview, what were you hoping to gather from the interviews?*

A: I wanted to invite these people to tell me about how they conceive of what is important. How do they make sense of how social and political processes function? How did they choose to work with and for change? Also, a particularly important question in this research, how do they handle resistance and inertia, because these kinds of processes are very difficult? They are trying to influence and work with governmental policies and large organizations. They work with foreign policy questions, social policy questions, crime and so on. You don't change things very rapidly when you are working there. So, how do they go about using their commitments, their understanding of complexity and their understanding of other people's patterns of meaning-making in order to devise change strategies? That was one very important topic.

Q: *Were you using the interviews in part to confirm what you had determined, that these people had the consciousness skills, self-awareness skills and awareness of self-embeddedness and to go beyond that to describe their meaning-making in these areas?*

A: You can say mostly the latter. My own personal purpose with this research project is to pinpoint and create a differentiated image of how these people make sense of what they are doing, what their motives are, how they work and also to learn from it, of course. I wanted to go beyond, as you said, these conceptions in order to differentiate and find more nuances in what we are looking at.

Another important purpose with this project is to actually document and show to people that you can make sense of politics in this way. These are real people. They are working in real organizations. They have been doing it for years and years and they actually make sense of their work in this way. There are interesting aspects of how they do this that we could all learn from. So, the target group for my research is not so much the general public, but people who are somewhere in these regions themselves. Here they can get a mirroring of what they are intuitively striving for, but perhaps have not articulated for themselves.

So, I am trying to articulate a kind of underlying logic that some people operate with. I don't think we can teach people at early conventional levels of ego development to develop in this way, but we can smooth the path for people who are already on the way with their own momentum.

Q: It sounds like the way you found these people is that you used your network very effectively. You talked to people you knew who referred you to people they knew and so forth?

A: Yes, that's right. And I tried to describe in simple terms what I was looking for. Of course, I couldn't know beforehand if the person I was going to interview actually fit into the target group. Some of the people I interviewed really didn't, but that was also very valuable because it helped me to make differentiations. Looking at how a person with a low level of awareness of his own subjectivity reasons about the resistance his efforts encounters, for example, gives me a better sense of what is characteristic of the people who actually have a high level of self-awareness. The contrast is valuable for discerning patterns.

Q: How many people did you interview totally?

A: I have interviewed 19 people in this project, but I also interviewed over 50 people in the earlier projects. Some of those people, reasoned in a way that allowed me in this project to draw on those interviews as well. So, there is a core group and then a wider reference group.

Q: And the 19 are the people who show a vision-logic level of development?

A: When you work with real people and real interviews, the differentiations don't get so very clear-cut. What I'm doing is to develop a kind of assembled portrait of a way of making meaning that some people operate with to a very large extent and some other people operate with only partially. There's a spectrum here of some people who very well fit into the model or image I'm assembling and there are some people who partly fit into it. There are a few people who don't fit into it very much at all. So, I have 7 or 8 persons who to a very large extent are similar to the image I'm assembling, whereas the rest to various degrees live up to those different characteristics.

Q: Having done these interviews, what are some of the conclusions that you've gleaned from this work?

A: I like being a bit drastic in order to grab people's attention. So, what I have been doing is to start with a very simplified description of this group of people in terms of seven characteristics or traits which I used one word each for. I go on to explain what I mean by those different words and give examples of them with quotes from the interviews.

Q: What are the seven characteristics?

A: They are divided into two categories that grew out of the analysis work over time. There are three characteristics that seem to be fundamental and they are not very much of a surprise when you compare them to consciousness development theories. Those three most fundamental characteristics I call '*Good,*' '*Clever,*' and '*Wise.*' These are people who are good, clever and wise.

'Good' means here that these are people who are strongly committed to some world-centric or holocentric values. However, anyone would say that they are committed to values that are universal. One of the challenges here is to sort out what is actually specific to this group of people in how they construct what is 'good.'

Perhaps it would be to go too far in this interview to delve into the theoretical differentiations here, but what is central is that they have an autonomous set of values that is clearly differentiated from particular story lines. They don't use a great story that points out who is good and who is bad in order make sense of what happens in the world, which would be a mythic-rational pattern of meaning-making. These people also do not use some kind of monological rationality where they use *one* particular ideology or perspective to interpret the world or make sense of what is good and bad. You can show this in their reasoning by looking at how, for example, they are very clearly able to be quite critical of their own country, their own organizations, the policies that their own organizations carry through and so on. They all have a quite distinctly felt autonomous value system to compare with all the time. This value system is clearly differentiated from concrete actors and organizations.

Q: You've called it world-centric. Is it a value system that is transcendent in a sense?

A: Well, this is also simplification.

It is quite useful for talking about these things to differentiate between egocentric, socio-centric and world-centric values. You can go on and talk about cosmos-centric values, for example, but that's not very useful here. It is sufficient to distinguish between three different levels. Egocentric values are values that relate to the individual, to the person. I try to maximize my own advantages and interests as far as I can. Socio-centric values make the interest of a particular collective the center of motivation, whereas world-centric values refer to what is good for the whole.

Q: In this group were you able to distinguish how they related to egocentric values differently than others who would not fit into this group?

A: Yes. That's a very interesting area of exploration, which I think you have to approach in a couple of different ways. One of them is that these are people who don't have very strong ego needs. They are not very strongly motivated by getting acceptance, collecting admiration from other people, gaining status and so on. In that way, they are quite mature people. They don't define themselves in terms of an idealized ego they have to live up to and get recognition for from other people.

Their egocentric needs are not very strong, but of course, they have them. They have needs for recognition. They have needs for a secure life situation. They have needs for doing meaningful work and so on. But the world-centric values, the existential, principled or universal values they feel committed to constitute a broad frame within which they can try to satisfy their egocentric needs.

There is an interesting relationship between the egocentric and world-centric needs in these people, because they somehow get fused. When you feel a deep, personal commitment to universal values, it also becomes a personal need for you to be able to serve those values, to work for them and to realize them. If you are unable to do so, you feel dissatisfied. If you are able to do it, you feel satisfaction. An important part of the egocentric needs becomes conditioned by the commitment to world-centric values.

Another interesting thing is that these values are not always very clearly articulated among these people. So, it's not always that they can report a list of, "Those and those are the values I feel committed to and that are the compass for what I am doing." But in the course of the interview, you nevertheless get a very strong sense that these people have a kind of internal compass which points out the direction for them to work, but they have not always been able to formulate in concepts, words and discourse what this compass is about. This is theoretically interesting because, in my interpretation, it points to something significant: a world-centric value orientation is not a product of discursive thinking. It seems it is rather a result of a felt commitment and a commitment to 'the Good', a commitment to the health of the whole. But you cannot so easily pinpoint what that means. You cannot make an ideology of it. It is more like a feeling than a discourse. I find that very interesting and would like to explore this theme further.

Q: *Does this have implications for how you would describe self-awareness and self-embeddedness for these people?*

A: This is a very important aspect of self-embeddedness, of course. That's the aspect of consciousness development that most covers the characteristic 'good' here. So, you can use that aspect to discuss what is happening here.

Self-awareness is important for goodness in the sense that these are people who have a clear sense of what are actually their egocentric needs and interests. Therefore, they are able to consciously decide how they should balance their own egocentric interests and needs towards the broader commitment that they have to the good of the whole. So self-awareness is a very important element in creating some kind of solidness in this goodness that these people display.

There is also a last aspect of the characteristic 'good' which is quite self-evident when you think about it. These are people who often feel it is important to work with values. Values are a field of work for them. They find values important and they often engage in organizational change projects that have to do with developing a clear conception of values, of making people reflect on values and develop value systems and so on.

Q: *Would you give an example of that?*

A: One example is a teacher at the National Police Academy in Stockholm who spends a lot of time trying to raise awareness, start discussions and to influence the way the education program is built up in order to emphasize such aspects as respect for people who have a weak position in the society, what that means when the police is out working on the streets and so on. That is one example. There are very many other people who engage in trying to build reflection on values into the organizational culture and structure in various ways.

Q: The second was 'clever.'

A: With 'clever' I mean mainly what we talked about before: a systemic understanding of causality, going beyond linear conceptions of how things happen into a systemic conception of causes and consequences. These are people who are described by others as having some kind of 'strategic overview,' people who can perceive large systems and interactions between different parts of systems, between part and whole and whole and part and between different kinds of systems. Most important—and this is not very simple to put words to—is that these are people who, wherever they go, expect there to be complex causes and consequences of everything. That's not so common as one would think in a society with very highly educated people in authorities and in other organizations. For people to actually use an ongoing awareness of there being complex causes and consequences is not as common as I would have hoped.

Q: Would you give an example of that?

A: Well, when you start talking with these people about a particular project or problem they are working with, they often start with giving a broad background. They talk about changes happening in the society: globalization, the role of the media, technologies, value systems. All those things are long-term processes that change the very conditions for the work they are doing. That's very typical.

They don't narrow down their focus of attention on a small part of the problem. They see the problem in a much broader context. In particular, they have a very keen sense of long-term changes going on, that you have to be aware of those changes and to adapt existing structures and policies to those changed processes. That could be, for example, long-term demographic change in birth rates, migration and settlement patterns that change the conditions for social welfare policies, crime and value formation. It could be how new information technologies change the conditions for political activism and political violence. It could be how the structure of military and civil defense has to adapt to fundamental structural changes in the global security policy system, and so on.

Q: Anything more about 'clever'?

A: These people usually have a long time horizon. They think in terms of slow change processes and they develop a certain patience. They know that these are processes that take a long time. They can contribute to push those processes a little bit in some kind of direction, but can't expect to achieve radical changes fast. They often engage in change processes that can take a long time.

What is also typical of these persons is that *because* they perceive systems and regard the characteristics of how systems operate as important causes for what happens, they see systems and structures as important fields of work. So, when we look at the 'good' aspects of these people, they like working with values. When we look at the 'clever' aspects of these people, they like working with systems. They like working with how their own organization operates as a social and administrative system. They like working with principles on a large scale.

Q: As your description of this is unfolding, I get a picture of people who are working within a set of strongly held values, but not looking for a completion. They realize they're in an on-going, organic, dynamic process that probably never ends.

A: Yes, and if we think about the historical development of politics in the Western world or in the world in general, we know that very much of the political dynamic that has developed comes from political movements having utopian visions of what society ought to be like—the Marxist movement, the Neo-Liberal movement and so on. But these integral thinkers, so to speak, don't find it meaningful to make a blueprint of what a society ought to look like and then try to implement this blueprint. They know that these organic, slow processes are very complex. There are very many conditions and interdependencies in those systems. Therefore, it is meaningless to make a blueprint of what solution would be ideal.

Instead, they look at those complex dynamic processes going on and start thinking about how we can introduce some elements into these processes so that they go in a different direction than they do now. How can we push this complex dynamic system in a certain direction? And then, what does it look like in ten years? It's probably nothing we could have expected because we cannot foresee how these processes are going to unfold in the future.

Q: That sounds a bit like 'wisdom'?

A: Yes, in a sense. 'Wise' means here, as I said, vision-logic, the ability to take systems of meaning-making as an object of attention. These are people who are well aware that people make sense of themselves and politics, for example, from within a certain kind of perspective. This has a lot of consequences. One is that these people are not embedded in one particular ideology or perspective, but they can shift among perspectives. They can use more than one perspective for understanding things and they are *interested* in the contrast between different perspectives. It also means that they usually have a certain sense of the characteristics of their own perspective. They know that their own system of interpretation has limitations. That also means that they are open to learning in a way that a more conventional meaning-making system is not open to.

Q: How do you see the implications of this?

A: Well, the consequence of being wise is that these are people who are quite interested in initiating processes that might lead to transformations of meaning-making patterns. They think about how they can create a process or situation that invites people to re-evaluate their values or interpretations and so on.

Q: *Did you come across an example of a strategy that was successful in doing that?*

A: There are small and large examples of that. A small-scale example is that I can be working in an organization and realize that people around me or people for whom I am the boss may be very concerned with their self-image. They may be anxious about being exposed as incompetent. That means that they close down communication. If you understand that aspect of other people's meaning-making systems, you can start by trying to create safe spaces and trusting relationships so it becomes possible for other people to relax a little bit, open up and then start to engage in processes where they look with more openness toward, for example, critical feedback. People who are very defensive are not very keen on doing that.

At a larger scale, we have people at the Swedish Department of Foreign Affairs who are looking at strategies for involving the entire corps of diplomats in the Swedish establishment in reflective processes on values. They are trying to find a good way of locating and describing individual diplomats who have acted in a way conceived of as being representative of a value-oriented foreign affairs administration. They want to present those examples as something you can discuss as a way of developing a clearer sense of the deeper purpose of being a Foreign Affairs official, in terms of values, for example.

Q: *I find it absolutely fascinating in that context that people are even willing to engage with each other in looking that carefully at questions of values.*

A: There is a lot of resistance as well, so it's not all a rosy picture.

Q: *Okay, we have 'good, clever, and wise.' Those are the first three categories and those were the fundamentals, right?*

A: Yes, and we can take the remaining four much more rapidly because they actually follow from those three. But I find it useful to point the spotlight at some of those traits or characteristics as well.

The fourth one is '*curious*.' These are people who are curious. That follows from the wise aspect. They are aware of the limitations in perspectives and systems of meaning-making. That means that they are often strongly process-oriented.

They are interested in working in a way that invites people into inquiring processes. They don't believe that they already know everything that needs to be known. They don't believe that they or any other people already have all the solutions. They are interested in how we create processes where we can learn and discover more in order to find better solutions to central problems.

One of the main sources of frustration for these people is when they encounter people who resist inquiring processes. They are frustrated with processes in which people only criticize or have ready-made solutions to everything. They feel very uncomfortable in organizations where there is no space for searching for more and deeper knowledge, where you can toss ideas around, where you can look at the drawbacks and advantages of a certain suggestion and where you can collaboratively develop new solutions. That's a quite important aspect of these people, this 'curious' trait.

Q: *And something that calls forth their wisdom hopefully.*

A: Yes, they are strongly interrelated.

Q: *And the fifth item?*

A: The fifth is that these people are "*inventive*". A more academic term would be "generative." Because they have this autonomous value system, they have an internal compass that points out their direction. That means that they very often generate new ideas about directions one could go in. They identify needs for change and they also come up with lots of ideas about what could be done. They are not embedded in existing structures, but they have cognitive freedom to think about possibilities, because they have differentiated their values from the existing structures.

These are people who are interested in change and have ideas about change. That is not always comfortable for large organizations to have. It means that they might land in conflicts and often land in dilemmas about, "…in what sense should I be loyal with the decisions already made and in what sense should I work for change even though there is already a policy?" But these people are generally very aware of this tension between the need to be loyal to democratically made decisions, on the one hand, and on the other hand to look for room to maneuver where they *can* push policies in new direction. That's the fifth aspect.

The sixth is that these are people I would like to call "*modest*." They don't have very strong needs for being visible, for getting attention, for getting recognition. They like it when they get it, but they are not *craving* attention and recognition. That means they have a kind of inner freedom to be solution-centered. They use several words and metaphors that capture this orientation in images. They talk about themselves as catalysts, as matchmakers, as enzymes and so on. They think of themselves as being actors in complex processes where it is not so important that, "I get credit for things, but I can contribute to better solutions for going in the direction of the values I find important…" and so on. If other people see this, good and well. If other people don't see this that is not so important, because they are satisfied anyway. So, these are people who often are not very visible to the general public. They work behind the scenes and they are quite content to do so.

Q: *And the seventh?*

A: The seventh is that these people are "*handy*." That's the English word I found closest to the Swedish word I am using. These are people who are quite pragmatic. They have a high level of social skills—emotional intelligence, social competence and so on. Because they have a good sense of how other people think, they are also quite able to be effective in evading other people's defenses and finding new ways to move things around.

Q: Handy generally means that people can do things in the material world. Fix a clock or a lamp or an automobile. They are adept.

A: Yes, that is what I'm after, at least metaphorically. It is a practical skill in getting things to work.

Q: Isn't this Platonic in the sense that society needs people with differing sets of capabilities?

A: Yes. I don't personally believe that these are things anyone could learn given enough time. I personally think that this also involves in-born talent. That is, of course, only an amateur theory of mine. But when I look around, I think that some people have the kind of natural talent for developing these kinds of skills and propensities whereas other people would have a very, very hard time or wouldn't even want to go in that direction.

Q: So, this is the nature/nurture issue?

A: Of course.

Q: What are the implications of that for integral politics?

A: I don't know if the implications are that far reaching, because any position you could take on nature/nurture has us back to the present moment where such development processes, if they are possible for all people, nevertheless move so slowly that it doesn't make a difference. In terms of our lifetime and our children's lifetime, we will live in a world with very unevenly distributed awareness, consciousness skills, identifications and so on. The people who have the inner freedom to put their talents and resources to work for the general good should have as good conditions as possible to do so effectively. That's somehow the way I think of it.

Q*: Where are you going from here with this research?*

A: I'm going to take a break from researching for a while and work more in the outside world, outside the university. I'm actually trying to put some of these things into action in terms of teaching and workshops for practitioners in various fields, but also in real world political processes. It could be smaller or larger issues.

I have some collaborative relationship with people at the Department of Foreign Affairs and allied authorities. I also work with the Crime Prevention Council here in Gothenburg, which is a very interesting organization with second tier people in it. They are presently concerned about an acrimonious debate going on about graffiti and how authorities should deal with young people who engage in illegal graffiti.

It is very interesting to think about how we can create inquiring processes for people who have diametrically opposed views on the best policy to follow here. If we can create processes that open up people's perspectives and make it possible to take in that there are different types of reasoning, we could apply it to this problem. So, those are some things I will do in the next few years. Maybe later I will go back to research and write up some more theoretical things. I would like to do that, but for the moment, I'm inclined to engage in more practical activities.

Q: *Do you anticipate that the training and development programs that you want to develop would draw on the research you've done in this project?*

A: Certainly, very much. I do think in terms of creating a course for people who work with strategic change as leaders or as change agents in order to focus attention on skill development in this area. So, that's a direct implication of this research project. I think I have a quite distinct and clear picture of what kinds of skill development areas need to be included in such a program.

Q: *Given what you said about nature and nurture, what would be some examples of skill development that you think can be nurtured?*

A: First I think that it's important to find the right people, to find people who do have a good basis to build upon. Then I think that these seven traits or areas can be made the object of attention in a workshop or program as inquiring processes— inquiries into value systems, your own value system, how you relate to value issues, what you find important and how you work with value systems. Participants can focus on what this systemic understanding of causality actually means in their own fields of work. They can engage in processes that foster vision-logic capacity for perceiving and comparing perspectives. I don't expect it to be very difficult to develop a very meaningful training program.

Q: *One part that I would wonder about is the selection of the participants, because it sounds like you're suggesting that there are people who are ready and can take advantage of this and people who are not.*

A: I think it's not so very difficult to describe this course in such terms that the suitable people recognize, "This is what I've been looking for. This is something for me." Whereas people who are not really mature or right for this kind of project would say, "This sounds fluffy, it is probably a waste of time." So, I don't think that is very difficult. The most difficult thing is how to make such a training program known to the people who might benefit from it. You probably need to have patience and make use of informal networks of contact at the beginning and start from there, using the snowball effect.

Q: *Finally, Thomas, what have you learned about yourself in relation to the model that you have created?*

A: Well, I have certainly obtained a set of differentiations that allows me to orient myself more keenly in any kind of change project. I sometimes have a tendency for developing grandiose plans, and this framework reminds me to attend to complexities, use my energies where they have a fair chance of achieving something worthwhile and then let go of ambitions that simply go beyond what is possible at the time being. I think the framework helps me manage my own resources in a more efficient way.

Q: *Thank you, Thomas.*

A: Thank you.

Thomas Jordan, *E.D. is an associate professor at the Department of Work Science, Göteborg University, Sweden. He holds a doctorate in economic geography, but for ten years has worked primarily with research, teaching and training in the fields of conflict management and adult development. He has published articles and research reports in a number of academic journals and a comprehensive website in Swedish on workplace conflicts. Some of his English texts are available at www.perspectus,se/tjordan.*

What’s Integral about Leadership?
A Reflection on Leadership and Integral Theory

Jonathan Reams

Abstract: This article provides an introduction to the idea of integral leadership. It describes the basic premises of integral theory, focusing on the four quadrants, levels or stages of development, and lines or streams of development. It briefly examines the relationship of consciousness to leadership, and then provides an overview of the history of leadership theory from an integral perspective. It then suggests a distinction between an integrally informed approach to leadership and integral leadership, and closes with questions deserving further inquiry.

Keywords: integral, leadership, consciousness, development, transpersonal.

Introduction

What’s integral about leadership? I hear the term “integral” being applied to just about everything these days. There is integral psychology, integral ecology, integral education, integral kabbalah, integral politics, integral naked, and even this journal, the *Integral Review*. Leadership is no exception to this phenomenon. There are seminars on integral leadership, academic programs on it, marketing slogans based on it, and essays aiming to define it. Integral seems to be the buzzword of the times in many circles.

All this talk about integral this and integral that leads to assuming some widespread common understanding of what integral means. While there does seem to be a basic common cognitive knowledge of the main aspects of integral theory, what it means to apply the theory (let alone naturally embody an integral consciousness) is at best a project just beginning, and at worst a rationalization for private agendas. This state of affairs makes for a broad spectrum of offerings on the subject. For my part, in this article I will present observations on my experience with both integral theory and leadership theory, and speculate on implications that have emerged for me. I have engaged in an ongoing personal inquiry in both of these areas, and it is my hope that these reflections will open up space for the inquiry of others as well.

So why do I care enough to write about this? As I think back, I realize that there has been a thread, or trajectory in my life that has brought me to pursuing this question. Early on in life I was exposed to notions of leadership somewhat indirectly. I grew up on a farm, and my father was involved in agricultural politics, as well as some local church leadership issues. I seldom witnessed any of this activity directly, but it did seem to seep into the implicit context informing my early development. Looking back on early experiences with friends and neighbors, at school and so on, I can see how I wrestled in my own way with a question – how could groups of people accomplish things together?

Of course at such an early age the ways of doing such things was implicit for me. As I matured and had children, I came to be more involved in community activities, especially around their education. I found myself in positions of leadership, not from seeking them, but because nobody else seemed interested, or able to do the job. Experiences like these led me to begin questioning why others seemed confounded by the demands of such positions.

SOME RIGHTS RESERVED

Eventually, such questions led me to the formal academic study of leadership. My involvement in community activities (I never actually worked in a business or organization) continued to reveal that people tended to operate from levels of consciousness inadequate for the situation. My formal study of leadership confirmed this, and also began to reveal a way to deal with the situation as I read of attempts to cultivate leadership.

Concurrent with this trajectory in my life was another one, and I have only recently been able to begin consciously integrating the two. I recall an evening conversation with a friend when I was 19. In the course of our discussion of esoteric topics, he stated that he wanted the ability to bend spoons psychically like Uri Geller. This drew out of me a response that I wanted the ability to change consciousness. While it has taken decades to realize the implications of that unanticipated pronouncement, it reflected a deep drive within me. It led to taking up a spiritual practice and eventually to pursuing a concurrent academic agenda (along with my course work in leadership studies) in the field of consciousness studies. My dissertation research (on *The Consciousness of Transpersonal Leadership*) began an attempt to integrate these threads, and has informed my understanding of the relevant issues in leadership and in integral theory.

In the course of my studies, I came across integral theory as a comprehensive framework for understanding the context for what I been learning and experiencing. For instance, I had wondered how to understand the seemingly competing truths of various theories on leadership over the last hundred years. I wanted to see the complexity of thought that has emerged as a coherent whole. I also wondered how the implications of a spiritual or transpersonal perspective could become meaningful and relevant in the context of figuring out how people could accomplish things together. It is these questions that will guide my reflections in this article.

To provide a snapshot of how I view these questions today, I will lay out what I view as the essential elements of integral theory, my thoughts on the development of leadership theory in this context, and then make a distinction between integrally informed and integral leadership in order to try and sort out what is integral about leadership. In making this distinction, I hope to find a useful way to distinguish why I would talk about integral leadership apart from all of the other ways of discussing it.

Integral Theory

Integral theory has as its goal to contextualize the "truth" about everything – that is, to show the domain of validity of any theory – its truth and its limitations, as well as the relationship of the theory to other theories.

> "An integral vision" - or a genuine Theory of Everything - attempts to include matter, body, mind, soul, and spirit as they appear in self, culture, and nature. A vision that attempts to be comprehensive, balanced, inclusive. A vision that therefore embraces science, art, and morals; that equally includes disciplines from physics to spirituality, biology to aesthetics, sociology to contemplative prayer; that show up in integral politics, integral medicine, integral business, integral spirituality. (Wilber, 2000b. p. xii)

Grounded in the work of Ken Wilber and those who have influenced his work (such as Jean Gebser, James Mark Baldwin, Jurgen Habermas, Abraham Maslow and Sri Aurobindo), it seeks a level of integration that has historically played out in debates between competing points of view. This is as true for the field of leadership theory as it is in hard sciences such as physics, or in the social sciences.

It is this capacity of integral theory to contextualize things, place them in a framework, that has been most useful for me as I have endeavored to understand the questions articulated above. I have found great value in the recognition of integral theory (in a way similar to post-modernism) that everyone is in some way right in their view. This validation of multiple truths has enabled me to hold my relationship to others with a more humble attitude. At the same time, knowing that each view also has its limitations, that all truths are not *equally* right, (not as present in post-modernism) has helped me understand, in very specific ways, how and why some views are more useful than others in a given context.

A core aspect of integral theory that resonates with me is how Wilber's conception of it is guided by a fundamental principle of wholeness. For me, this wholeness represents a transrational way of framing things. Gebser's (1985) notion of integral consciousness as being a "world[view] (that) goes *beyond our conceptualization*" (emphasis in the original, p. 267) points clearly to its being beyond our rational analytical mode of knowing the world. My experiences from spiritual practice, research in transpersonal areas of consciousness studies and psychology, as well as studies in hermeneutics and quantum physics have all reinforced and validated this view of the fundamental nature of wholeness.

To look more closely at integral theory I will focus on three fundamental aspects of the model that have been useful to me; the four quadrant model, levels or stages of development, and lines or streams of development.

The Four Quadrant Model

In my life I have encountered many varied points of view, most of which do not tend to agree with mine. At the same time I often perceive an underlying commonality in experience with others. As I struggled to understand why this was the case, coming across this aspect of Wilber's articulation of integral theory was very useful. With the four quadrant model, I could see how others were tending to emphasize different aspects of the wholeness of their experience in perception. This model shows that any phenomenon can be characterized along a pair of axes, a continuum between poles of internal and external aspects, as well as individual or collective aspects. Table 1 shows how these four quadrants map out the different domains.

The upper left hand quadrant covers the interior individual aspects of experience, and are intentional. This quadrant includes areas of study such as psychology. The lower left hand quadrant covers the interior collective aspects, and describes the cultural world space, and includes the interpersonal domain of relationships. The upper right hand quadrant covers the exterior individual, and is behavioral in its focus. It also covers the physical sciences such as physics, chemistry, geology etc. Finally, the lower right hand quadrant is the exterior collective, or social system, and includes approaches like sociology.

Table 1: The Four Quadrant Model
(Adapted from Wilber, 2000)

	Interior	**Exterior**
Individual	Intentional	Behavioral
Collective	Cultural	Social

The holistic principle underlying the integral model shows up here as a fundamental interconnectedness. Wilber (1996) notes that "a pathology, a 'sickness,' in any quadrant will reverberate through all four quadrants, because every holon has these four facets to its being" (p. 138). An example he gives is of a society with slave wages for dehumanizing labor (lower right quadrant), reflecting in low self-esteem for laborers (upper left quadrant), and corresponding dysfunctions in brain chemistry (upper right quadrant), leading to alcohol abuse becoming institutionalized (lower left quadrant). Thus a dysfunction that shows up most prominently in any one quadrant is also present in the entire system.

Levels or Stages of Development

The most helpful aspect of integral theory for me has been the concept of stages of development. Having a way to clearly distinguish stages of the evolution of a host of aspects of human nature (more on this in the next section) has enabled me to make coherent meaning out of previously baffling experiences. It has also helped me work more effectively with other people, taking into account how to communicate in ways that will make sense for them at a given stage of development.

Developmentalism is a key element of integral theory. The process of development is one of a fusion or identification with one level, a differentiation from or transcendence of that level, and an integration and inclusion of the new level. This process, while fluid, tends to stabilize or center itself around definite stages, or levels that are clearly recognizable. A number of theorists have set out models of development, based on extensive research, that Wilber has drawn on for his integral model. While there are differences in the number of stages listed in some models, and differences in terms of what lines of development is being looked at (ego, cognitive, moral, emotional, spiritual etc.), there is remarkable similarity in the overall patterns discerned by researchers.

A good description of the process of how our self sense develops comes from Robert Kegan (1994, 1982). Kegan describes how two basic personality structures relate to each other as development evolves. One structure is our sense of self as an object, something which one can consciously examine, suspend, or have a relationship with. The other is our sense of self as subject, or the structure from which we construct order from experience. The relationship between the subject and object fluctuates. Overall, this relationship is dynamic and evolving continuously in various dimensions. Within this dynamic evolution, there are periods of relative stability during which the self has a period of identification with each level, or order, of consciousness.

> Subject-object relations emerge out of a life-long process of development; a succession of qualitative differentiations of the self from the world, with a qualitatively more extensive object with which to be in relation created each time; a natural history of qualitatively better guarantees to the world of its distinctiveness; successive triumphs of 'relationship to' rather than 'embeddedness in.' (Kegan, 1982. p. 77)

This qualitative differentiation allows for distinct qualities and characteristics to be recognized as gains of each level. The "more extensive object" that we gain the capacity to be in relationship to at each level continually enlarges our capacities for acting in the world.

An example of a developmental model that illustrates this process comes from Bill Torbert (2004). His research has identified eight distinct levels of development, or what he calls action-logics. At each level, a new organizing principle, or action-logic emerges as the self as subject from which one makes meaning and order out of experience. What had previously been the operating logic of the self as subject at the previous level is now a self as object, or an object of reflection, governed by the new operating principle. Thus the development of each stage transcends and includes what came before.

One begins at the impulsive level, where impulses rule behavior. At the second level, needs rule impulses, making an object out of what was the self as subject. At the third level, norms from society rule needs. At the fourth level a person has the norms of society as an object, and is ruled by a craft logic, or expert mentality. A person moves to level five when the self as subject operates through system effectiveness, and has craft logic as an object to relate to. Level six brings a capacity for reflexive awareness that rules the need for system effectiveness. At level seven, a self-amending principle rules reflexive awareness, and at level eight, process (an interplay of principle and action) rules over the self amending principle. From these descriptions, the "more extensive object" Kegan talks about is illustrated through the progressive expansion of what one is capable of having a relationship to rather than being embedded in.

Lines or Streams of Development

I noted above that the concept of developmental stages applies multiple aspects, or lines of human nature. In each of these lines, also sometimes described as streams of development, the process of evolving from simple to more complex relationships to these aspects of our human existence is similar to the one described for our self sense. Examples of other lines of development are intellectual, emotional, relational, spiritual, ethical, aesthetic, physical. Note that these relate to the individual quadrants, internal and external, the latter since there are corresponding behaviors associated with the internal streams. Thus the "the *overall self*, then, is an amalgam of all these 'selves' insofar as they are present in you right now . . . all of them are important for understanding the development or evolution of consciousness." (Wilber, 2000a. p. 34)

One implication of differentiating the various streams of development is that it helps us understand how we can be at different levels of development in different areas of our lives. We can have very well developed intellectual capacity, with poor moral development. Or we can have high levels of emotional and interpersonal development, but have stunted spiritual development. A central line of development is that of consciousness. My early interest in working with consciousness and my later formal study of the subject makes it is worth explicit attention on its own.

Consciousness

Consciousness is a core aspect of integral theory. Consciousness is seen as a fundamental component of reality by many researchers in fields like transpersonal psychology, quantum physics, and even leadership. Debashis Chatterjee (1998) notes that consciousness is not the result of processes in the human brain, but rather "an integral, unchanging entity characterized by the qualities of wholeness and indivisibility" that orchestrates all of the complex tasks of the human brain. In this context, even our self sense, or identity, is shaped by our level of consciousness.

Chatterjee goes on to explain that while;

> there can be various states of consciousness, . . . these different states do not alter the fundamental nature of consciousness. . . it is not consciousness that changes, but it is our

> way of becoming conscious that changes from one human being to another. (Chatterjee, 1998, pp. 35-6)

This reflects the self's personal *experience of* consciousness as changing, contrasted with the impersonal *nature of* consciousness itself as unchanging.

One way Wilber describes the developmental levels of consciousness is in terms of a ladder, with the rungs representing the different levels, or stages of consciousness. First, the rungs themselves represent the various levels of consciousness as fulcrums, or centers of gravity in the stages of consciousness. It is the self sense, identity, or ego, that climbs the ladder. This self has complex levels of development within itself, but tends to be centered around one particular rung at any given time. As this self climbs the rungs on the ladder, it gains a perspective, or world view corresponding to that rung. Thus there is the ladder, the self that climbs the ladder, and the world view from each rung.

Consciousness and Leadership

The intersection of consciousness with leadership is where the trajectories of my own life have come together. In doing my dissertation research, I came across a number of authors who had undertaken similar lines of inquiry. Chatterjee (1998) goes on to say that "leadership is not a science or an art, it is a state of consciousness" and that "we can now begin to grasp the phenomenon of leadership as the field of awareness rather than a personality trait or mental attribute" (p. 24). Harald Harung (1999) has done studies of leadership based on Transcendental Meditation. Harung's primary principle is "that how people perform, individually and collectively, is fundamentally controlled by one factor – human development" (p. 7)

In a study of world class leaders, Harung, Heaton, Graff, and Alexander (1995) describe how peak performance was related to experiences of higher states of consciousness. Findings showed that, compared to people in a normal population, a significantly higher percentage of world class performers had frequent experiences of higher states of consciousness. Descriptions of these experiences also listed heightened awareness as the major focal point. Harung et al. also noted a generalizability of peak performance to a wider range of activities, indicating that these higher states of consciousness were not tied to specific forms of activity or training.

Torbert's work, described earlier, provides another example of the relationship between consciousness development and leadership capacity. A long term study done by Torbert and associates clearly showed that the success of organizational transformation efforts was dependent upon the level of consciousness of leadership. In order to handle the complexity of change required for organizational transformation today, a level seven consciousness was required in CEOs.

These few examples of the centrality of consciousness to both integral theory and leadership point to the seeds of an integral approach to leadership that will be discussed later. In some ways they represent the result of a century of thought on the subject of leadership.

A Brief History of Leadership Theory

The brief introductory overview of integral theory provided above follows one of the main trajectories of inquiry in my life, the development of consciousness. The other main trajectory has been around understanding leadership. As I have moved along this trajectory, a question that has arisen for me is; how did leadership theory get to the place where it is beginning to take an integral perspective? This section will follow this question by examining some of the main themes of leadership theory over the last century. Along the way I will apply the integral framework to the different theories. While there are many attempts to synthesize current and historical understandings of leadership, they often attempt this integration from the same level of consciousness as the theories they are integrating. This leads to a lack of perspective essential to the integration. Applying an integral framework to an examination of leadership can provide the necessary meta-perspective to move beyond current theories towards pointing out what an integral approach to leadership might look like.

An Integral Perspective on Leadership Theory Development

The four quadrant model of the integral framework can provide a useful way to look at how tensions in leadership theory development have emerged over time. The fundamental holistic principle underlying the integral perspective reminds me not to fit theories neatly within a quadrant. Instead, I have come to recognize that they represent lenses that frame our perception along certain lines. Actual experience always encompasses all four quadrants. Thus in leadership studies, the lens of leader's character and traits emphasize the upper left quadrant, or the intentional realm. Leader behavior and style shifts attention towards the upper right, or behavior quadrant. Cultural issues such as role expectations, implicit or explicit group norms and values are the focus attention of the lower left or cultural quadrant, and organizational structure issues generally emphasize the lower right, or social quadrant.

Examining the history of leadership theory along the axes of the four quadrant model, I see a tension between internal aspects of leadership, seen in areas such as traits and qualities on the individual side, and culture and communication on the collective side, with external aspects such as skills and behaviors for the individuals, and organizational structure and position for the collective. Also, there is a tension along the vertical axis that runs from the individual or agency aspect of leadership at the top to the communal or collective aspect at the bottom. This continuum is seen clearly in the history of leadership theory. There is a fundamental tension between the effect and role of the individual and the effect and role of a host of other factors including followers and their relationship to leadership, as well as to the context, situation, or environment.

Trait Theory

A hundred years ago, the value of the individual and the role of groups were hotly debated. While followers of Marx pointed to economic and social class factors in the progression of society, and followers of Darwin looked to the nature of biology as a determining factor, William James was defending "the notion that individual human beings can and do make a difference in the course of history" (Harter, 2003. p. 4) and that the study of such individuals is a valuable contribution to leadership.

This set the stage for some of the first systematic attempts to study leadership in the beginning of the 20th century, and contributed to the development of a trait oriented theory. Trait theory is also known as the "Great Man" theory, or the heroic model of leadership. It posited that by identifying the innate qualities and characteristics possessed by great social, political, and military leaders, one could find appropriate kinds of people to hold the reigns of power. (Northouse, 2001) This theory focused leadership almost exclusively in the upper left quadrant, with it being about individuals and their innate, intentional qualities and characteristics.

Style Theory

As time went on and people examined the trait approach to leadership theory and application, its limits became more apparent. For one thing, the growth of business in North America and elsewhere led to an increasing need for people in positions of management that entailed leadership capabilities, and there were not enough "Great Men" to go around. Thus there was a shift in emphasis in leadership theory from the "Great Man" personality trait that was innate, to the need to see leadership in terms of styles of personality and behavior that could be learned. This moved leadership theory into a focus on the upper right quadrant.

The style approach to leadership conceptualizes leadership as a "form of activity" and focuses on what leaders do and how they act. This includes the actions of leaders toward subordinates in various contexts (Northouse, 2001). A limitation of this shift in perspective from an integral view is that it fragmented leadership theory by not connecting the interior trait aspects of leadership with the exterior behavioral aspects.

As the style approach was developed over time, it identified two broad categories of leader behavior; task and relationship, expanding attention into the lower right quadrant as well as the upper right. Several important studies done in the 50's and 60's (e.g. Ohio State, Blake and Mouton) examined ways leaders mixed task and relationship to create a particular leadership style. This move into the relational aspects was also influenced by the concurrent growth of group dynamics approaches to leadership.

Group Dynamics Theory

While this move from trait to style still primarily focused on the individual, others were looking at the role of group dynamics in leadership, moving down the vertical axis into the collective domain. A definition that emerged in the 1930's stated that "Leadership is personality in action under group conditions. . . . It is also a social process" (Rost, 1991. p. 47). Rost describes how during the 30's the influence of sociologists recognized that leadership had a huge relational aspect – that leaders did not lead in a vacuum, but that they were dependent on the group. This group dynamic view of leadership continued to gain prominence during the 40's and 50's, in part fueled by the impact of the famous Hawthorne studies.

Situational Leadership Theory

As the study of leadership progressed, the limitations of trying to explain all leadership through theories that emphasized either the individual or the group became apparent to some researchers. Hersey and Blanchard developed the situational approach to leadership theory in the late 60's. This approach was based on the premise that different situations demand different kinds of leadership (Northouse, 2001). In the situational approach, a leader assesses the development level of subordinates and matches his or her leadership style (a mix of directive and supportive elements) to the subordinates needs in the particular situation. This represents a step towards being more sensitive to the context of leadership, an important integral principle, and indicates beginning to include the lower right quadrant in the picture. It should also be noted that what is meant by development level of followers is not necessarily the same as the levels of development of consciousness used in integral theory, but do represent a line of development, making distinctions between levels of capacity in people.

Other Theories

Other leadership theories have emerged over the last 30 years or so that looked for ways to better address the increasing complexity of the topic as researchers kept questioning the gaps between existing theories and experience. Contingency theory, similar to situational theory, looked to match the traits of leaders (upper left) with the context (lower right). This theory suggests that a leader's effectiveness depends on how well the leader's style fits the context, and that effective leadership is *contingent* on matching a leader's style to the right setting (Northouse, 2001).

Path-goal theory was the first leadership theory to strongly emphasize the leader/follower relationship through its focus on the level of motivation of the follower (lower left quadrant focus, also introducing a line of development, motivation). This theory was a kind of contingency approach that emphasized the relationship between the leader's style and the characteristics of the subordinates and their work setting (Northouse, 2001). As a style approach (upper right quadrant) rather than a trait approach, it sees that appropriate behaviors can be taught, and is thus less dependent on the traits of the leader and more amenable to training.

The psychodynamic approach is an attempt to explore the emotional factors at play within the leader-follower relationship. This brings another line of development into the picture, and has been developed more recently by Goleman (2002, 1995). From an integral perspective, emotional intelligence makes an important distinction of a key element of the interior aspects of leadership.

Transformational leadership was introduced by Burns (1978) and is concerned with inspiring or motivating followers to achieving higher levels of moral conduct and value based actions. It involved assessing followers' motives, satisfying their motivational needs, and treating them like full human beings. Transformational leadership introduces more lines of development, values and morals, into leadership theory.

Another aspect of an integral view of leadership development is the movement from egocentric views through ethnocentric ones, to worldcentric views. Some of the early trait theories centered on a very egocentric view of leadership. As group dynamic approaches became more popular, the good of the group brought a more ethnocentric view into prominence. An example of a worldcentric approach to leadership can be seen in Greenleaf's (1977) servant leadership model, which placed the leader as servant, not primarily of the needs of the individual or company, but of the greater good of humanity. (See review of Greenleaf biography in this issue). Some of this worldcentric level of development can also be seen in transformational leadership.

More recently, there have been a number authors exploring new territory about how to look at leadership and organizations. Most of these new theories have arisen as theorists began to explore more advanced levels of development that recognize a need to respond to the complexity of the post-modern world with new ways of thinking that can meet these challenges. Thinkers such as Margaret Wheatley (1993), Peter Senge (1990, 1999, 2004), Ronald Heifetz (1994, 2002), Debashis Chatterjee (1998), Harald Harung (1999), Dee Hock (1999), Joseph Jaworski (1996), Harrison Owen (2000), Robert Rabbin (1998), Bill Torbert (2004), and Peter Vaill (1996), have all aimed to expand how we view leadership. These explorations have ventured into areas such as consciousness, spirituality, and new scientific theories. They have taken leadership theory into new territory, and help to bridge between older views of leadership and an integral approach to leadership.

Outlining an Integral Approach to Leadership

Having examined some basic principles of integral theory and then the development of leadership theory over the last century, I now turn to outlining what I perceive as the basic elements of an integral approach to leadership. The various leadership theories just examined cover the broad strokes of the territory for understanding the evolution of thinking on leadership, but none puts them all together. Not only that, none of them is grounded in a meta-framework able to contextualize and understand the value of each aspect of and approach to leadership, as well as their relationships to each other. What further distinguishes an integral perspective on leadership is that it also refers to a very specific set of developmental capacities that transcends how leadership has been seen up until now.

In laying out an integral approach to leadership, I want to distinguish between two variations. One is to talk about an “integrally informed” approach to leadership and its development. The other is to talk about “integral leadership.” The integrally informed approach has a broad appeal, can be used by a wide spectrum of people, and sets the stage for some very strategic approaches to leadership development. Integral leadership in and of itself refers to a very specific level of development and set of capacities being present in a leader.

Integrally Informed Leadership

In the integrally informed approach, the integral model is utilized by and for leaders across the spectrum of developmental capacities. The advantage this has is that it makes the integral model accessible to those who wish to benefit from its strengths. Strategies for leadership development programs can benefit from understanding the need to address the four quadrants, recognizing specific lines of self that need growth, and tailoring all of this to the levels of development of those in such programs. An example of this is how the U.S. Military Academy at West Point “has updated their curriculum and pedagogy so that it now accounts for a cadet’s level of self-development. . . . awareness of levels is primarily a tool for increasing *instructor* awareness and effectiveness” (Putz and Raynor, 2004. p. 13).

A challenge or drawback of this approach is that the capacity to gain intellectual understanding of the integral model can outstrip the ability to actually engage and act from an integrally informed perspective. Anyone using the integral model will comprehend and act on it in a way that is filtered by the leading edge of their developmental capacity. This can lead to a reduction of the concepts and principles of the integral model. This is further complicated by the issue of disparities in development along different lines within a person. These factors can produce a false sense of having grasped the integral model, and misusing it as a tool to justify actions that are less than integral in their scope or intention.

My own initial encounter with the integral model was of great benefit in understanding one situation in particular. At the time I was finding myself continually at odds with a person from whom I had taken over a leadership position in a small community non-profit organization. When we explored the foundation of our understanding of the mission of our organization, we appeared to see things the same way. Yet when we would act on that understanding, clear differences in interpretation would emerge. This led to constant frustration, and confusion for members of this organization dealing with the discrepancies in action and resulting conflict. For a long time I tried to understand this phenomenon without success, until I read through a section of Wilber’s *Integral Psychology* that described the relationship of different developmental worldviews. A light went on, and I could see how the similar language between us was being implicitly interpreted and acted upon in very different ways. This insight allowed me to stop banging my head against the proverbial wall, and begin to take a different approach that, while not totally resolving the situation, allowed me to make significant progress.

The integrally informed approach to leadership can make useful distinctions and bring insight into situations. A growing number of programs are utilizing the integral model to guide how they approach leadership development. Notre Dame University's Mendoza College of Business has begun an Executive Integral Leadership Program (www.nd.edu/~execprog/programs/eilp/). The Leadership Circle (www.theleadershipcircle.com) has begun using a 360 assessment tool that is grounded in the integral model. The number of such programs, as well as consultants and businesses that will make use of the integral model is bound to keep rising, as early adopters continue to have success in meeting the complex demands of leadership development today.

The other variation for approaching integral leadership is often viewed as being a more "elite" approach, as it says that integral leadership is not simply about being informed by integral theory, but is about displaying the level of development necessary to perceive and act from an integral place within oneself.

Integral Leadership

So now I come to the punch line – what's integral about leadership? How does integral leadership distinguish itself from any other kind of leadership? Also, why is it important or even necessary? What can one do as an integral leader that they could not do as any other kind of leader? These are big questions, and to answer them in full is beyond the scope of this article. What I can do is offer a perspective that distinguishes integral leadership in a very specific way, to introduce it as a concept. I can also point to areas for further exploration that take the convergence of these trajectories and project them out. In the end, integral leadership may be both invisible and obvious at the same time. It may exist around or in us, and yet not have the need to appear, or be recognized, unless circumstances elicit it.

To get started, I will draw on a distinction made by Putz and Raynor (2004). They delineate a view of integral leadership in the context of challenges for business to sustain growth in two areas, their existing core business competencies and simultaneously secure future growth through radical innovation that opens up new markets. "We call the ability to manage through paradox – to navigate the apparent irreconcilable demands of creating a sustainable growth business – *Integral* leadership" (p. 2). In examining the essential nature of what is being called for with integral leadership, they say that "the systematic development of the psychological maturity – rather than the intellectual capability" (p. 7) is key to the capacity for integral leadership.

Looking back at the discussion of levels of development, there is clear evidence that this is what is being described as psychological maturity. Kegan's (1994) work identifies five levels of consciousness. Putz and Raynor have adapted this to leadership capacities. Their description provides a specific set of conditions related to an integral consciousness and how it applies to leadership.

Table 2: Levels of Self Development and Leadership (Putz and Raynor 2004, with permission)

Level of Self Development	**Subjective Self-Understanding**	**Leadership Strengths**	**Leadership Weaknesses**
1) Impulsive	"I" am my impulses (like a very young child) and unable to take the perspective of others	None	Leaders not found at this level of development
2) Egocentric	"I" am my needs and desires -able to manage my impulses and to take the perspective of others, but motivated solely by my own needs and desires	Aggressive, "can do" personality	Destructive to teamwork and initiative ("my way or the highway")
3) Interpersonal	"I" am defined by my relationships and social roles – what is "right" is defined by rules, regulations and proper authority (chain of command)	Strong team player and supporter of organizational vision	Independent thinking, mediating competing relationship demands, e.g., boss, family, subordinates
4) Autonomous	"I" create my own identity, inclusive of but not defined by my roles, relationships and the expectations of others	Better able to take independent action and mediate competing relationship demands, e.g., boss, subordinates	Rigid self-identity that is associated with current success and threatened by fundamental change
5) Integral	"I" am a continually evolving person who is *aware* of development in myself and others; "I" have a flexible sense of identity that embraces complexity and paradox on a personal level (not just intellectually) but nevertheless has clear values and boundaries	More adaptive to fundamental change without threat to personal identity; better able to support the self-development of others, and understand oneself in a multi-paradigmatic way	Flexible self-identity may be confusing or threatening to subordinates; might push others to grow before they are ready

Putz and Raynor note that "an Integral leader is able to objectively assess how one's own identity tends to be formed within the frame of a true but partial paradigm and is more capable of evolving their sense of self-identity as required in the face of paradoxical change" (p. 11). This capacity to reframe identity is one way in which integral leadership sets itself apart from other kinds of leadership. This ability also only emerges in specific circumstances, with the above example from the world of business describing the paradoxical nature of such circumstances. These paradoxical circumstances are such that other levels of leadership are not able to meet the challenge, making integral leadership necessary in order to be successful.

When conditions of this nature arise, they are in essence asking a leader to be of two minds, literally, in order to manage the paradox. A leader will need to operate from a level five (See Table 2) consciousness, and choose to construct an appropriate identity, or mind, for operating in each pole of the paradox. An identity, or mind, will be constructed (utilizing a level four consciousness as a tool, or an object of reflection) with specific capacities, tendencies and strengths to engage the world, chosen for best dealing the particular pole of the paradox it is designed for. The leader will then construct another mind with the same process to deal with the other pole of the paradoxical situation. They will then be "of two minds" which can be confusing for those working closely with them! Yet it is this very capacity that is essential to handling the level of complexity brought about by the paradoxical situation.

This ability to be of two minds elicits a question. Who or what is choosing the design and doing the operating of those minds? This question speaks to the heart of the notion of integral consciousness. The lead article in this issue of *Integral Review* discusses Jean Gebser's opening of the integral paradigm, and he is quoted as characterizing the difficulties in representing integral by saying that "this world[view] goes *beyond our conceptualization*" (1985. p. 267). In turn, this leads into transpersonal realms, and notions of the soul. The burning question for me then becomes, what is the nature of this transpersonal beingness, and how does it show up at all of these different levels of consciousness, in leadership, and in our everyday lives?

Conclusion, or at least a pause for now

I now come to the end of this article, and pause to summarize where I have been and where it might lead. Writing this article has enabled me to reflect on two major trajectories in my life – leadership and consciousness. Excursions into the realms of integral theory and the history of leadership theory provided the background in these areas, and led to looking at their convergence in the notion of integral leadership. The question that titles this article, what's integral about leadership, now has the beginnings of a provisional answer. Fleshing out this answer is a subject for future consideration, as is the relationship between transpersonal consciousness to leadership.

So is there something to all the buzz about integral you name it? I find myself of two minds on the question. When I delve into the heart of the issue, I feel that yes, there is something of inestimable value behind the buzz. When I encounter it in the world, whether in application, discussion, or debate, I am not always so inclined to give my hearty approval. This could mean that we are all simply in the early stages of moving into this paradigm, and have not yet distinguished clear markers of its presence. It could at the same time reflect my own struggle to manifest a self in the world in an integral way. These are open questions for me, and reflections on these and other such questions will have to await a future issue of *Integral Review*.

Ein Integraler Gestalt-Ansatz für Therapie und Beratung

Reinhard Fuhr und Martina Gremmler-Fuhr

Zusammenfassung: In diesem Text stellen wir unseren Ansatz für Psychotherapie und Beratung auf dem Hintergrund des integralen Paradigmas dar. Wir erläutern zunächst kurz vier Anforderungen an ein integrales Konzept in diesem professionellen Bereich: Umgang mit Komplexität und Vielperspektivität, Berücksichtigung gerichteter, vieldimensionaler Entwicklung, Orientierungs- und Sinngebungsfunktion, Realisierung relationaler Qualitäten in der Arbeit. Nach einer Begriffsbestimmung von „Therapie", „Beratung" und „Bildung" charakterisieren wir das seit vielen Jahren von uns entwickelte Konzept für den Integralen Gestalt-Ansatz unter den Fragen nach (1) den Intentionen und Aufgaben von Therapie und Beratung, (2) der Gestaltung der Kommunikation und Beziehung, (3) der Art der Problemdefinition und dem Umgang mit Diagnostik sowie (4) den Strategien und Methoden - alle unter Rückkopplung an die zuvor erläuterten Anforderungen an ein integrales Konzept.

Schlüsselwörter: Psychotherapie, Beratung, intentionaler Dialog, Gesprächszyklus, Beziehung, holarchische Entwicklung, Phänomenologie, Hermeneutik, Problemidentifikation, Diagnostik

Abstract: In this text we present our approach to psychotherapy and counselling on the background of the integral paradigm. We shortly explain four major requirements for such an integral concept: handling complexity and multi-perspectivity, considering directed and multi-dimensional development, offering orientation and meaning, relational qualities. After defining the terms „psychotherapy", „counselling", and „education" we present our concept for the Integral Gestalt Approach which we have developed and evaluated for many years by dealing with four questions: (1) the intentions and tasks of therapy and counselling, (2) the formation of communication and relationship, (3) the specific way of defining problems and using diagnostics, and (4) the strategies and methods - all related back to the major requirements of an integral concept.

Key words: therapy, counselling, intentional dialogue, cycle of contact, relationship, holarchical development, phenomenology, hermeneutics, disidentification, problem identification, diagnostics.

Eine paradigmatische und gesellschaftliche Herausforderung

Eine immer unübersichtlicher und komplexer werdende Welt stellt uns vor neue Herausforderungen und Orientierungsprobleme. Deshalb wachsen gleichzeitig auch der Bedarf und das Angebot an Therapie und Beratung. Dieses psychosoziale Feld ist jedoch selbst nicht weniger komplex und unübersichtlich. Als schon seit vielen Jahren praktisch tätige Berater und Psychotherapeuten und im akademischen Bereich Forschende und Lehrende forderte uns dies heraus, nach neuen Möglichkeiten der Orientierung und Konzeptentwicklung zu suchen. Jede dieser neueren Beratungs- und Therapieschulen und Ansätze wie klientenzentrierte, systemische, hu-

SOME RIGHTS RESERVED

manistisch-psychologische sowie ressourcen- und lösungsorientierte Beratung und Therapie fanden wir zwar interessant und hilfreich, aber sie blieben auch immer etwas schuldig: sie betonen bestimmte Aspekte - und vernachlässigen andere. Auch die Versuche „integrativer“ Ansätze haben uns insofern nicht überzeugen können, als sie zwar oft theoretisch oder forschungsmäßig gut begründet sind (Grawe 1995, Petzold 1998), aber die zugrunde liegenden Paradigmen entweder nicht ausreichend mitreflektiert werden, oder sie mit den philosophischen und metatheoretischen Grundannahmen des Integralen Paradigmas nur teilweise vereinbar sind.

Solche Grundannahmen konnten wir schließlich selbst auf der Grundlage der Philosophie von Jean Gebser, der Synopse vieler Entwicklungstheorien durch Ken Wilber sowie der Theorie der Gestalttherapie zusammenstellen und in langjähriger Praxiserfahrung und eigenen Forschungen weiterentwickeln.[1] Es war und ist immer noch ein intensiver Prozess der philosophischen und (meta-)theoretischen Reflexion, der Praxiserprobung und eigener (Selbst-)Erfahrungen - und dies im ständigen Wechselspiel -, was uns schließlich zu dem hier in aller Kürze dargestellten Konzept geführt hat. Dabei werden wir zunächst vier grundlegende Anforderungen an den Ansatz formulieren und dann das eigentliche Praxiskonzept unter vier Fragenkomplexen darstellen.

Anforderungen an das integrale Praxiskonzept

Die Anforderungen an unser Praxiskonzept für den Integralen Gestalt-Ansatz für Therapie und Beratung (meist zu „Ansatz“ oder „Integraler Ansatz“ gekürzt) möchten wir zu vier Komplexen bündeln:[2]

1. *Umgang mit Komplexität, Vielperspektivität und Widersprüchlichkeit*: Dies sind wesentliche Herausforderungen unserer Zeit, nicht nur im beruflichen und persönlichen Alltag, sondern auch durch die exponentielle Zunahme an Informationen, Erkenntnissen, technischen Möglichkeiten und Entscheidungsalternativen. Die Aufgabe des Ansatzes muss daher auf konzeptioneller ebenso wie auf praktischer Ebene Antworten geben auf Fragen wie: „Wie können wir in der komplexen, oft verwirrenden Welt zurecht kommen?“ oder „Wie komme ich mit den vielen Widersprüchen in der Welt und in meinem Umfeld klar?“ und „Welche persönlichen, ethischen sowie politischen Entscheidungssituationen ergeben sich daraus?“
   Gleichzeitig müssen wir immer wieder sinnvolle Formen der Reduktion dieser Komplexität und Widersprüchlichkeit finden, zumal wir nicht mehr zu eindimensionalen Ursachenerklärungen wie in früheren Zeiten zurückkehren können.
2. *Gerichtete, vieldimensionale Entwicklung über die gesamten Lebenszyklen*: Diese ist heute in einer Weise möglich, die in der Vergangenheit nur einzelnen Menschen offen stand, und auch nicht unbedingt erforderlich war. In individueller, gemeinschaftlicher, ökologischer und

---

[1] Siehe hierzu „Veröffentlichungen“ unter www.gestaltzentrum.de.

[2] Ausführlicher hierzu in Fuhr & Gremmler 2004 und www.integrale-studien.de. Anregungen zur Formulierung dieser Anforderungen und zum Textentwurf insgesamt verdanken wir auch Thomas Jordan (siehe den Leitartikel in diesem Heft).

politischer Hinsicht scheint sie heute jedoch mehr denn je zwingend notwendig zu sein, wenn wir den Herausforderungen der Gegenwart und Zukunft auch nur ansatzweise gerecht werden wollen.[3]
Diese Art der Entwicklung kann aber nicht nach überkommenen linearen Denkweisen konzipiert werden, sie muss der Komplexität und Vielschichtigkeit Rechnung tragen. Darüber hinaus ist Entwicklung als *gerichtete Entwicklung* hin zu größerer Vielfalt, Komplexität und Einheitlichkeit zu verstehen; gleichwohl kann sie nicht *determiniert werden,* ist also letztlich immer *ergebnisoffen*. Bei dieser Entwicklung spielen überdies eine Vielzahl von Dimensionen des Menschseins eine Rolle.

3. *Orientierung und Sinngebung*: Ein Integrales Praxiskonzept muss in der in jeder Hinsicht unübersichtlichen Welt Angebote der Orientierung und Sinngebung in allen wichtigen Lebensbereichen machen können, ohne auf allzu konventionelle Glaubenssysteme zurückgreifen zu müssen. Dies betrifft also etwa Berufsfindungs- und Neuorientierungsprozesse ebenso wie ökonomische Formen oder Partnerschaftsmodelle und Lebensziele sowie existenzielle Entscheidungsprozesse.
4. *Realisierung der Beziehungsqualitäten alles Lebendigen*: Es wird zunehmend deutlicher, dass jeder Einzelne, jede Gemeinschaft und Nation in ein Kommunikations- und Beziehungsgeflecht eingebunden ist, und dass jede (neue) Technologie und praktische Entscheidung oft unüberschaubare Konsequenzen für den jeweiligen engeren und weiteren Kontext hat.[4] Ein Integrales Konzept muss daher neue Modelle für zwischenmenschliche Austauschprozesse und Beziehungsentwicklung anregen. Hierzu können wir auf vielfältige Konzepte aus der dialogischen und systemischen Tradition, u.a. der Gestalttherapie, zurückgreifen, diese weiterentwickeln und integrieren.

Diese generellen Anforderungen schlagen sich auf vielfältige Weise im Praxiskonzpet des Ansatzes nieder, wie wir beispielhaft verdeutlichen werden. Beginnen wir aber zunächst mit einigen Anmerkungen zu den Begriffen “Beratung”, “Therapie” und „Pädagogik“ aus einer Integralen Perspektive.

“Therapie”, “Beratung” und “Pädagogik”

In einer Welt vernetzenden und ganzheitlichen Denkens ist es nicht so leicht, klar zwischen Beratung, Therapie und beratenden Tätigkeiten im Rahmen von Bildungsarbeit zu unterscheiden, wie dies in vielen professionellen und öffentlichen Kontexten üblich ist und gefordert wird. In all diesen Settings geht es darum, dass Einzelne, Gruppen und andere soziale oder organisationale Einheiten durch „Experten” unterschiedlicher Art in ihren Anliegen, Herausforderungen, Problemen und Schwierigkeiten sowie bei ihren Entwicklungsinteressen angeleitet und unterstützt werden. Die Experten übernehmen dabei spezielle Aufgaben und Funktionen, für die sie qualifiziert sind. Natürlich unterscheiden sich die Anforderungen und professionellen Kompetenzen, je nachdem, ob die Experten mit Menschen mit schwerwiegenden psychischen und sozialen Problemen arbeiten, oder ob sie eine Abteilung in einem Produktionsbetrieb umstrukturieren helfen, oder ob sie Schülern bei der Lösung von Mathematikaufgaben helfen. Diese unterschiedlichen Anforderungen und Kompetenzen stellen jedoch ein Kontinuum dar, das beispielsweise von der Klärung sachlicher und fachlicher Probleme bis hin zur Arbeit mit tiefgehenden psychischen Beeinträchtigungen einzelner Personen reichen kann. Aber die Beschäftigung mit einem sachbezogenen Thema kann rasch zu biographisch bedingten Problemen hinführen und umgekehrt. Da kommt es dann nicht nur auf die jeweiligen Kompetenzen des Experten an, sondern auch auf den Vertrag zwischen ihm und den Klienten, der mit darüber entscheidet, wie weit man sich einlässt und wo Grenzen gezogen werden sollen. Trotzdem sind die Grenzen zwischen Therapie, Beratung und Pädagogik oder Erwachsenenbildung fließend, auch wenn die Vorstellung, dass Lehrende in Bildungsinstitutionen sich auch oder vielleicht sogar in erster Linie als Berater verstehen müssten, ähnlich ungewohnt ist wie die, dass Beratung und Therapie als eine besonders intensive und nachhaltige Form des Lernens verstanden werden könnte.

---

[3] Siehe hierzu z.B. Laszlo (2003).

[4] Siehe auch hierzu z.B. Laszlo (2004).

Aus all diesen Gründen scheint es uns gerechtfertigt zu sein, ein Basiskonzept für Therapie *und* Beratung einschließlich aller beratenden Aufgaben in Bildungszusammenhängen zu entwerfen. Auf diesem Basiskonzept können dann Spezialisierungen für unterschiedliche professionelle Felder mit unterschiedlichen Aufgaben und Anforderungen aufgebaut werden. Die professionellen Funktionsträger (Berater, Therapeuten, Dozenten etc.) nennen wir dabei einheitlich "Mentoren", diejenigen, für die die Dienste der Mentoren in Anspruch nehmen, bezeichnen wir durchgängig als "Klienten", und wir meinen in jedem Fall Personen beiderlei Geschlechts oder auch Gruppen und andere soziale Einheiten.

Dieses Basiskonzept für soll anhand von vier Fragenkomplexen erörtert werden (siehe auch Abb. 3):

1. Intention und Aufgabe des Ansatzes,
2. Kommunikations- und Beziehungsgestaltung zwischen Mentor und Klient sowie die Rollenfunktionen, die jeder der Beteiligten dabei einnehmen kann,
3. Art und Weise der Problembestimmung und Diagnose sowie
4. Strategien und methodische Vorgehensweisen.

Begründet sind die Vorstellungen unseres Praxiskonzepts einerseits in den allgemeinen und speziellen Prämissen und Prinzipien eines Integralen Ansatzes, und andererseits in unseren langjährigen Praxiserfahrungen in Therapie, Beratung und Pädagogik in verschiedenen Berufsfeldern (mit einem Schwerpunkt im Non-Profit-Bereich sowie in Bildungs- und Gesundheitsinstitutionen).

Das Praxiskonzept

1. Intention und Aufgaben

Die Anliegen des Praxiskonzepts für den Integralen Ansatz besteht erst einmal darin, Orientierung, Anregung, Unterstützung und Begleitung bei allen möglichen Herausforderungen und Schwierigkeiten zu bieten. Darüber hinaus geht es aber auch um Lern- und Entwicklungsprozesse, d.h. *lernende Weiterentwicklung* in persönlicher, sozialer, ökologischer, organisationaler oder politischer Hinsicht soll initiiert und unterstützt werden. Eine Notwendigkeit, sich weiter zu entwickeln, wird von den Personen, die Therapie oder Beratung aufsuchen, zwar oft empfunden. Allerdings gehen die Erwartungen meistens in die Richtung von veränderten Verhaltensweisen, neuen Strategien und Problemlösungen, weniger in Richtung grundlegender Veränderungen oder gar krisenhaften Lernprozesse. Trotzdem gehen wir davon aus, dass jedem Menschen und jeder Gemeinschaft auch ein grundlegendes Entwicklungsstreben eigen ist, auch wenn es nicht im Vordergrund des Interesses stehen mag.

Polarität des Akzeptierens und Veränderns

Unser Ansatz hat somit eine doppeltes Anliegen, die einen polaren Gegensatz bildet: Zu akzeptieren, was ist, und gleichzeitig grundlegende Veränderungen anzustreben. Die Notwendigkeit zu grundlegender, nachhaltiger Veränderung ist darin begründet, dass sich Schwierigkeiten im Lebensalltag von einzelnen und sozialen Einheiten sehr häufig daraus ergeben, dass alte Gewohnheiten und Muster wirksam werden, die der gegenwärtigen Situation und den neuen Herausforderungen nicht angemessen sind oder sogar destruktiv wirken. Auf gesellschaftlicher und globaler Ebene besteht an dieser Notwendigkeit zu grundlegendem Wandel in den meisten Lebensbereichen eigentlich kein Zweifel mehr, doch diese Einsicht auch auf sich selbst und die eigenen sozialen Bezugsgruppen anzuwenden, scheint sehr viel schwieriger zu sein.

Der Mentor muss sich also einerseits in den Klienten einfühlen, ihn vorbehaltlos unterstützen und Partei für ihn ergreifen, und er muss andererseits als *Change Agent* wirksam werden können. Die meisten Beratungs- und Therapieschulen setzen auf den einen oder anderen Pol, und dies nicht ohne Grund; denn diese Polarität auszubalancieren, ist keine leichte Aufgabe: wir müssen als Mentoren empathisch sein und Verständnis zeigen, gleichzeitig müssen wir uns auch für grundlegende Veränderungen der Reaktions-, Verhaltens-, Beziehungs- und Lebensmuster stark machen. Wenn wir Menschen, die in Schwierigkeiten sind, dabei allerdings mit dem ausdrücklichen oder heimlichen Imperativ entgegentreten, dass sie sich wandeln müssten, provozieren wir leicht Widerstände aller Art.

Perspektivenwechsel und "dritte Instanz"

Bei diesem Balanceakt hilft das Integrale Prinzip der Vielperspektivität, hier besonders im Hinblick auf die verschiedenen *Bewusstseinsmodi*: es geht darum, sich identifizieren zu können mit der aktuellen Situation und dem eigenen Erleben sowie mit dem des Klienten, dann aber wieder herauszutreten und sich zu disidentifizieren und den Bewusstseinshorizont zu erweitern, damit die größeren Zusammenhänge, die anderen Parteien in einem Konflikt, die sachlichen Bedingungen und die Prozesse in den Blick kommen, in denen sich die Klienten selbst und auch der Mentor mit den Klienten befinden. Es geht hierbei also nicht nur um den Wechsel der Perspektiven, sondern auch darum, dafür verschiedene Bewusstseinsmodi verfügbar zu haben und diese den Klienten verfügbar machen zu können. Dabei spielt die Fähigkeit zur *Disidentifikation,* das Sich-Lösen aus der unmittelbaren Erfahrung (ohne den emotionalen Kontakt dazu zu verlieren), eine herausragende Rolle.

In vielen Traditionen, die sich mit Bewusstseinsentwicklung befassen, wird in diesem Zusammenhang vom *inneren Zeugen* oder auch von der *dritten Instanz* gesprochen. Diese dritte Partei ist akzeptierend und wohlwollend, aber keineswegs unkritisch, sie ist weder verwickelt noch kühl distanziert. Daher kann sie dabei unterstützen, sich immer wieder aus Verstrickungen und Reaktionsbildungen zu lösen und (wieder) Zugang zu erweiterten Sichtweisen, zu Mitgefühl und zu eigenen Ressourcen zu finden. Die dritte Instanz ist also der innere *change agent par excellence,* da er sowohl das, was ist, mitempfindend akzeptieren, als auch für grundlegende Veränderungen die Energie und Richtung vorgeben kann. Ein zentrales Anliegen dieses Ansatzes ist es, dass auch der Mentor den Zugang zu dieser dritten Instanz immer wieder findet, diese Instanz eine Zeitlang für den Klienten übernehmen und dem Klienten selbst Zugang dazu ermöglichen kann.

Entwicklungsperspektiven

Bei diesen Herausforderungen spielen persönliche und soziale Entwicklungsprozesse neben den sich ständig verändernden materiellen, institutionellen und politischen Bedingungen eine wichtige Rolle. Wir können hier nur auf die vielen Entwicklungsmodelle, die Synthesen von Ken Wilber (z.B. 1996, 2000) oder unsere eigenen Modifikationen und Anwendungen dieser Entwicklungsmodelle auch für den Kontext von Beratung und Therapie hinweisen.[5] Thesenartig zusammengefasst geht es um Folgendes: Die Entwicklung von Personen und sozialen Einheiten vollzieht sich stufenmäßig und in vielen verschiedenen Dimensionen über den gesamten jeweiligen Lebenszyklus. Die Stufen bilden Holarchien: die jeweils höhere Stufe transzendiert und umfasst wesentliche Strukturen der vorhergehenden Stufen. Diese Stufen können als unterschiedliche Paradigmen charakterisiert werden, die trotz aller kulturellen und persönlichen Varianten wesentliche gemeinsame Merkmale aufweisen. So kann man beispielsweise präpersonale Paradigmen von personalen unterscheiden und diese jeweils wieder untergliedern, wie dies auch schon Jean Gebser vollzogen hat: vom Archaischen zum Magischen zum Mythischen zum Rationalen zum Integralen. In Anlehnung an diese paradigmatischen Stufenfolgen von Gebser (1995) und die differenzierteren von Wilber (2000) und in deren Modifikation hat sich nach unseren Erfahrungen die in Abbildung 1 dargestellte Holarchie für die Arbeit mit Erwachsenen sehr bewährt. Für Kinder und Jugendliche und für klinische Zwecke müssen die präpersonalen Stufen sicher weiter differenziert werden, und einige Theoretiker glauben, dass auch der Integrale Stufenbereich weiter zu gliedern ist.[6]

---

[6] Siehe z.B. Daniel Stern (1992) im Hinblick auf das Kinder- und Jugendalter und Commons & Richards (2002) für den Integralen Bereich.

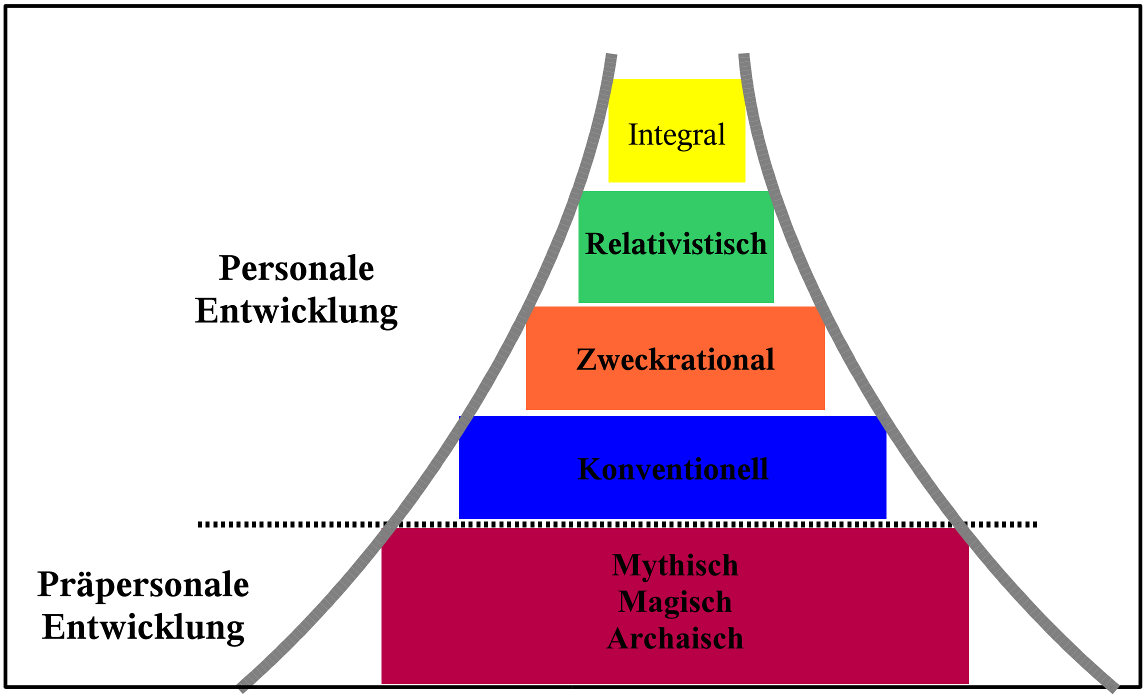

Abbildung 1: Fünf Stufen oder Paradigmen der Entwicklung

Dieses Spektrum der Entwicklung kann man unter *verschiedenen Entwicklungsdimensionen* betrachten. So entwickelt sich das *Weltbild* vom Magisch-Mythischen zum Konventionellen, Rational-Erfolgsorientierten und Relativistischen zum Integralen (Abb. 1). Damit wandeln sich auch die *moralischen Einstellungen und Handlungsweisen* vom Ego-Zentrischen und Gruppenbezogenen zum umfassenderen Soziozentrischen hin zum Weltzentrischen und Universellen. Das *Selbstverständnis* entwickelt sich von der starken Selbstbezogenheit der präpersonalen Paradigmen über ein Selbst, das sich vor allem als Rolle in einer überschaubaren Gemeinschaft versteht, über ein sich selbst reflektierendes Selbst, ein sensitives Selbst, das mit möglichst vielen Anderen mitempfindet, bis hin zu einem Selbst, das all diese vorherigen Selbstverständnisse im Wesentlichen integriert hat und jeweils autonome Entscheidungen fällt und verantwortet. Auch die *Denkweisen* wandeln sich in diesem Spektrum der Entwicklung vom vorkausalen zum monokausalen Denken, dem zufolge es nur *eine* richtige Ursache für Probleme gibt, hin zum multikausalen Denken, das mehrere Ursachen anerkennen kann, zum systemischen Denken, bei dem nicht mehr nach einzelnen Ursachen, sondern nach Dynamiken, die bestimmte Probleme hervorbringen, gefragt wird, bis hin zu vernetzendem Denken, das die Verflechtungen vieler solcher Dynamiken und die verbindenden Muster erkennen kann.

Ähnliche Entwicklungsdimensionen können aufgezeigt werden für die Gefühlswelt, das ästhetische Empfinden, das Verständnis von Sexualität und Liebe, von Spiritualität, aber auch für eher kollektive Phänomene wie Kommunikationsweisen, Formen der Beziehungsgestaltung, oder der Lebensgestaltung und der Institutionalisierung.

Da also eine Aufgabe unseres Ansatzes in der Moderation von Entwicklungsprozessen besteht, ist es wichtig für den Mentor, sich zu vergegenwärtigen, in welchem Paradigma er sich selbst und der Klient gerade bewegen. Das schlägt sich nicht nur im Problemverständnis oder im Reflexionsvermögen und in vielem anderen nieder, sondern auch in der Erwartung des Klienten an den Berater. So kann in ihm vor allem der „Helfer in allen Lebenslagen" gesehen werden, oder jemand, der einen nur unterstützen muss, das eigene Durcheinander zu klären, damit man seine autonome Entscheidungsfähigkeit wiedergewinnt, oder er wird als Begleiter bei grundlegenden krisenhaften Umwälzungsprozessen angesprochen usw. Und natürlich bewegt sich auch der Mentor vorwiegend in einem bestimmten Paradigma, aus dem heraus er mehr oder weniger Schwierigkeiten hat, den Klienten zu verstehen und mit ihm in Kontakt zu kommen.

Die Verwendung dieses Entwicklungsmodells, das wir hier nur kurz angerissen haben, wird dadurch noch komplizierter, dass wir es normalerweise nicht mit einheitlichen Stufenausprägungen und in sich stimmigen Paradigmen zu tun haben, da sich die Entwicklung in vielen Dimensionen vollzieht und es bei diesen dimensionalen Entwicklungsprozessen große Unterschiede geben kann. Daraus erwachsen dann innere Spannungen und Konflikte bei Personen und in sozialen Einheiten. Außerdem kommt es immer wieder vor, dass wir zeitweise auf frühere Stufen im Spektrum regredieren oder „Ausflüge" auf Entwicklungsstufen machen, die weit über dem liegen, was uns normalerweise verfügbar ist. Mehr als eine Orientierung für ein hochkomplexes Geschehen können diese Entwicklungsvorstellungen also nicht leisten, aber diese Orientierung kann von großem Wert für die Gestaltung der Prozesse sein.

Die Aufgabe unseres Ansatzes entpuppt sich also auch hier wieder als mehrschichtig: zum einen muss sich der Mentor bewusst sein, dass nicht nur grundlegende Erwartungen an seine Rolle entwicklungsabhängig sind, sondern auch die Fähigkeiten der Klienten zur Verantwortungsübernahme und zur Reflexion der eigenen Schwierigkeiten und Verhaltensweisen. Er muss darüber hinaus in der Lage sein, sich auf die jeweiligen Paradigmen einzustellen und auch eventuelle Diskrepanzen zu erkennen und zu akzeptieren. Vor allem aber muss er die Klienten dabei unterstützen, solche paradigmatischen Möglichkeiten und Begrenzungen zu realisieren und sie nicht innerlich oder äußerlich zu verleugnen oder zu bekämpfen. Zum anderen hat er die Aufgabe, Entwicklungsanstöße zu geben, damit sich die Klienten lernend im Rahmen des Spektrums weiterentwickeln können.

Transformative und translative Lernprozesse[7]

Diese Entwicklungsprozesse können sich nun auf die Erweiterung und Optimierung der vorhandenen Einstellungen und Kompetenzen im Rahmen ein und desselben Paradigmas beziehen - dann sprechen wir in Anlehnung an Ken Wilber von *translativen* Lern- und Entwicklungsprozessen. Oder es kann sich um grundlegende Wandlungsprozesse von Einstellungen und Kompetenzen in den verschiedenen Dimensionen auf allen Stufen der Entwicklung handeln - dann sprechen wir von *transformativen* Prozessen, bei denen alte Gewohnheiten und Muster erkannt und überwunden werden.[8] Transformative Prozesse sind sehr oft von Turbulenzen und Krisen begleitet, die der besonderen Beachtung und Unterstützung bedürfen. Normalerweise finden transformative Prozesse allerdings auch viel seltener statt als translative, wobei Krisen (die ja häufig in der Therapie und Beratung zur Sprache kommen) transformative Prozesse auslösen und unterstützen können.[9]

---

[7] In den USA wurde ein Konzept zur *Integral Transformative Practice (ITP)* auf der Grundlage der Arbeiten von Michael Murphy und Ken Wilber entwickelt, das jedoch einen ganz anderen Schwerpunkt als unser Ansatz hat: dort geht um die Integration von Übungen für die persönliche und spirituelle Entwicklung (siehe z.B. Ferrer 2003), während unser Ansatz für die ganz normale professionelle psychotherapeutische und beraterische Praxis und Theorie-Entwicklung gedacht ist und den Schwerpunkt auch nicht auf die spirituelle Entwicklung legt (siehe Fuhr & Gremmler-Fuhr 2005).

Bei transformativen, also Paradigmen überschreitenden Entwicklungsprozessen, kann man wiederum zwei Arten unterscheiden. Prozesse der *Nachentwicklung* und solche der *Weiterentwicklung*. Bei Nachentwicklung geht es um das Nachholen von Reaktionsweisen, Kompetenzen und Einstellungen in bestimmten Dimensionen, die sich nicht organisch und in Balance mit der Gesamtentwicklung der Person oder sozialen Einheit entwickeln konnten wegen schwieriger Lebenssituationen, Deprivationen oder gar traumatischen Ereignissen. Dabei haben sich bestimmte Defizite, Fixierungen und Störungen herausgebildet, die es soweit wie möglich aufzuarbeiten gilt. Als ein paar Beispiele seien starke Selbstwertprobleme, Schuldkomplexe, Abgrenzungsschwierigkeiten, Suchtphänomene, Machtdynamiken, regressive Abhängigkeiten oder paranoide Vorstellungen und Verhaltensmuster genannt. Bei einer Weiterentwicklung geht es um gegenwärtige Veränderungswünsche und -notwendigkeiten, um das Bedürfnis, im Leben und in den Beziehungen grundsätzlich etwas ändern zu wollen, sowie um existenzielle Sinnfragen.[10]

Wie wir eingangs feststellten, bewegen wir uns bei diesen Entwicklungs- und Lernaufgaben auf einem Kontinuum zwischen Psychotherapie oder sogar Psychiatrie einerseits und fachlich-sachlicher oder organisatorischer Beratung andererseits. Je nach Ausbildung und Interessenschwerpunkt und eigenen Entwicklungsprozessen und -problemen werden sich die Mentoren mehr der einen oder anderen Aufgabe zuwenden, sich hierfür qualifizieren und unter entsprechenden Vereinbarungs- und Vertragsbedingungen arbeiten. Es wäre jedoch wünschenswert, dass in jedem Fall das *gesamte Spektrum der Entwicklungsmöglichkeiten* vertraut ist, da man sonst allzu leicht entweder die Schwierigkeiten der Klienten verkennt oder sie beispielsweise auf bestimmte “Störungen” fixiert, obwohl es ihnen um ganz andere Anliegen geht.

Erfolgskriterien

Woran und wie überprüft man nun, ob die Aufgaben erfüllt und Intentionen realisiert werden? Auch diese Frage fordert vielschichtige Antworten heraus. Während diejenigen Therapie-

---

[8] Dieser Unterschied zwischen translativ und transformativ ist manchem Leser vielleicht aus der Entwicklungstheorie Jean Piagets bekannt: Assimilation und Akkomodation. Häufig wird der Begriff „transformativ“ allerdings nur für den Wandel vom „postmodernen Relativismus“ hin zum integralen Paradigma verwandt (z.B. Mezirow 2003 oder die *Integral Transformative Practice* des Esalen Instituts), nicht jedoch für *alle* Paradimgenwechsel im Spektrum holarchischer Entwicklungen.

[9] Allerdings sieht es ganz so aus, als ob wir vor der Notwendigkeit transformativer Prozesse im großen Stil stehen, wenn die weltweiten Krisen in nahezu allen Bereichen des Lebens nicht zur Überlebensfrage werden sollen (siehe hierzu u.a. Laszlo, 2003).

[10] Siehe hierzu auch Fuhr (2001, 2003).

und Beratungsansätze, die einem anderen als dem Integralen Paradigma zuzuordnen sind wie psychoanalytische, verhaltens- und lösungsorientierte oder systemische Ansätze, relativ klar angeben können, wann eine Beratung oder Therapie erfolgreich und „ihr Geld wert“ ist, sind wir nur in der Lage, Kriterien zu nennen, die im Rahmen rational-erfolgsorientierten Denkens als vage und kaum überprüfbar gelten. Der Ansatz hat natürlich auch eine Dienstleistungsfunktion und daher sind Erfolg und die Zufriedenheit der Klienten ein wichtiges Kriterium. Aber eben nicht nur, denn Entwicklungs- und Lernprozesse machen nicht immer - und vor allem nicht rasch - zufrieden und glücklich.

Sicher ist es wichtig zu überprüfen, ob der Klient nach der Therapie/Beratung klarer sieht, ob sich sein Selbstwertgefühl gesteigert, sein Zutrauen in seine Kompetenzen erhöht, sich Symptome verbessert, verworrende Beziehungen und Konflikte im Team geklärt wurden usw. Solche Erfolge sind relativ leicht einschätzbar und teilweise sogar objektivierbar.

Dann kommen aber Kriterien hinzu, die eben der anderen Intention des Ansatzes entsprechen, zu nachhaltiger Entwicklung beizutragen. Unter diesem Gesichtspunkt heißt das allgemeine Kriterium schlicht: „Ist Bewegung in die Erstarrungen und Fixierungen gekommen?“ Viele (wenn nicht vielleicht sogar die meisten) Probleme und Unzufriedenheiten rühren aus erstarrten Gewohnheiten und Mustern, die den gegenwärtigen Herausforderungen nicht mehr gewachsen sind und kreative Anpassungsprozesse erschweren oder unmöglich machen. Wenn solche Erstarrungen gelockert wurden, die Klienten flexibler wurden in ihren Einstellungen, Verhaltensmustern und Reakionsweisen, ist viel im Sinne eines Integralen Ansatzes erreicht. Dabei sollten die „Bewegungen“ auch eine Richtung haben: hin zu mehr Komplexitätsbewältigung, zu mehr Freiheit und (Mit-)Verantwortung in den Entscheidungen, mehr Blick für das jeweils größere Ganze, mehr Bewusstheit usw.

Solche Qualitätskriterien zu überprüfen ist in Auswertungsgesprächen möglich, die immer wieder einmal durchgeführt werden, besonders natürlich zum Abschluss einer Beratung oder Therapie, aber auch zwischendrin, wenn man einen Scheideweg erreicht hat, im Prozess stecken geblieben ist oder der Jahresrhythmus solche Zwischenbilanzen nahe legt. „Prozessevalution“ heißt das Zauberwort; diese liefert jedoch kaum objektive Daten, aber doch nachvollziehbare Ergebnisse; vor allem kann sie den Lernprozess selbst wieder neu anstoßen und ausrichten.

All dies sind keine geringen Herausforderungen an den Mentor ebenso wie an die Klienten. Um in dieser Weise produktiv arbeiten zu können, sind bestimmte Grundbedingungen erforderlich, allen voran die Gestaltung einer vertrauensvollen und respektvollen Beziehung.

2. Kommunikations- und Beziehungsgestaltung

Bei dem zweiten Fragenkomplex, unter dem wir unseren Ansatz darstellen wollen, geht es darum, wie die Gesprächssituationen selbst gestaltet werden. Wir brauchen hier nicht die für die Profession üblichen und selbstverständlichen Bedingungen zu erläutern wie den Vertraulichkeitsschutz, Bewahrung der Integrität der Klienten durch den Mentor und umgekehrt, Vertragsklarheit etc. Besondere Aufmerksamkeit gilt jedoch der Gestaltung der Kommunikation und Beziehung. Hier können wir auf eine Reihe bewährter und theoretisch begründeter Konzepte zurückgreifen: Martin Bubers „Philosophie des Dialogs“; Carl R. Rogers' personzentrierte Gesprächsführung; das Prinzip der „selektiven Authentizität“ aus der Themenzentrierten Interaktion von Ruth C. Cohn („Was der Mentor mitteilt, muss authentisch sein, aber er sollte keinesfalls ungeprüft alles mitteilen!“); insbesondere aber Modelle der Gestalttherapie-Theorie wie der „Kontaktzyklus“ und die „Kontaktfunktionen“ und schließlich unser Konzept des „Meta-Dialogs“.[11]

Relationale Bedingungen

All diese Konzepte und Modelle legen es nahe - und die Erfahrung bestätigt dies immer wieder nachhaltig - dass Lernprozesse generell, besonders aber diejenigen, die nach diesem Integralen Ansatz ausgelöst werden, bestimmte Bedingungen für Kommunikation und Beziehung erfüllen sollten. In zusammengefasster Form geht es dabei um folgende Aspekte:

- Lernprozesse geschehen zu einem erheblichen Teil als Kontaktprozesse zwischen Personen und ihrer Umwelt, und deren angemessene und kreative Gestaltung entscheidet wesentlich darüber, ob Klienten überhaupt etwas lernen können, und ob dieses Lernen nachhaltig wirkt.
- Erkenntnisse, Wissen und Einsichten lassen sich nicht „vermitteln“ oder gar „beibringen“. Diese entstehen im Austauschprozess selbst - sie werden also jeweils neu in der Situation geschaffen. Damit ist kein Verzicht auf schriftlich oder mündlich überlieferte Erfahrungen und Erkenntnisse gemeint, aber auch diese müssen jeweils von uns neu „erfunden“ und integriert werden, sonst können wir sie nur als mehr oder weniger schädliche Fremdkörper „schlucken“.
- Das Kommunikations- und Beziehungsklima wird jeweils mit gelernt, ob wir dies wollen oder nicht, denn es wird mit den Lernereignissen zusammen neurologisch verankert. Wenn wir also etwas unter Angst lernen, lernen wir die Angst mit und aktivieren sie wieder, wenn wir das Gelernte anwenden sollen.[12] Es geht also wesentlich darum, in der Gesprächssituation selbst und auch längerfristig für Sicherheit zu sorgen, und zwar nicht nur für die Klienten, sondern eben auch für den Mentor, denn in Unsicherheit und Angst verliert auch dieser einmal seine Geduld und Kreativität oder sein Engagement.
- Kreatives und nachhaltiges Lernen im Austausch mit anderen geschieht an den Kontaktgrenzen. Mentor und Klient müssen sich jeweils neu an diese Kontaktgrenzen herantasten und sie möglichst nicht allzu häufig überschreiten, da dies Verletzungen mit sich bringen kann. Aber sie sollten auch nicht zu weit von den Kontaktgrenzen entfernt bleiben, da sonst wichtige Potentiale verloren gehen.
- In der Beziehung zwischen Mentor und Klienten etabliert sich sowohl eine Hierarchie, als auch eine Heterarchie. Die Hierarchie ergibt sich aus den unterschiedlichen Rollenfunktionen und dem notwendigen Machtgefälle zwischen dem Mentor als Experten und dem Klienten. Heterarchie heißt hier: die Gesprächspartner begegnen sich als Personen auf gleicher Ebene mit gegenseitigem Respekt.

---

[11] Siehe Fuhr & Gremmler-Fuhr (2004), besonders Kapitel 3.

[12] Hierzu z.B. Spitzer (2002).

Intentionaler Dialog und Meta-Kommunikation

Das Kommunikations- und Beziehungskonzept für diesen Ansatz lässt sich wohl am besten als „intentionaler Dialog“ zusammenfassen:[13] Die Gesprächspartner haben die Intention, sich u.a. im Sinne der o.g. Kriterien zu begegnen, aber sie respektieren es auch, wenn diesem Bemühen Grenzen gesetzt sind und eine kontaktvolle Begegnung nicht möglich ist. Dabei sollte der Mentor natürlich der erste sein, der dieser dialogischen Intention Ausdruck und Gestalt zu geben versucht.

Unerlässlich dabei ist, dass die Möglichkeit zur Meta-Kommunikation verfügbar ist. Auch wenn die Möglichkeiten der Reflexion - und vor allem der Selbst-Reflexion - eingeschränkt sein mögen, so besteht doch fast immer die Möglichkeit, sich über die Art der Kommunikation und Beziehung auszutauschen. Dazu bedarf es meist jedoch der Anleitung. Da zwischenmenschlicher Austausch ein äußerst sensibler und störanfälliger Prozess ist, wie viele Kommunikationsforscher und Systemtheoretiker glaubhaft belegen, gehören Missverständnisse, Verstörungen und Konflikte zum Alltag, auch in Therapie und Beratung. Sofern wir sie thematisieren und immer wieder konstruktiv klären können, tragen sie meist sogar zur Intensivierung der Lernprozesse und der Beziehung bei. Aber eben diese Klärung ist immer wieder notwendig und sollte ganz selbstverständlich zum Austauschprozess gehören.

Wichtig für den Integralen Ansatz scheint es uns auch zu sein, dass sich die Gestaltung der Kommunikation und des Beziehungsgeschehens möglichst an der Normalität orientiert; das heißt, dass sowohl spezieller Sprachjargon („Psycho-Sprache“), ärztlich-therapeutische Fachausdrücke oder Begriffe aus der Systemtheorie etc. wenig oder nur in aufgeklärten Formen verwendet werden und ungewöhnliche Kommunikationsmethoden und Techniken sehr sparsam eingesetzt werden, sofern sie überhaupt notwendig sind. Denn es geht - wie zuvor erläutert - um Nachhaltigkeit: der Gesprächsprozess selbst sollte auch immer als Modell für den Alltag gelten können, wenn auch sicher in modifizierter und weniger intensiver Form, aber doch in der grundsätzlichen Qualität. Auf diese Weise können Erkenntnisse, die dabei gewonnen werden, viel leichter in den Alltag übertragen und integriert werden.

3. Problembestimmung und Diagnose

Problemdefinition, Mustersuche und Sinnfindung

Der Bestimmung des Problems im weitesten Sinn wird in unserem Ansatz eine wichtige Bedeutung beigemessen. Erst wenn klar ist, was den Klienten in welchen Situationen und in welcher Hinsicht berührt, bedroht, Sorgen macht, unter Druck setzt oder zu Entscheidungen nötigt, können wir „der Sache auf den Grund“ gehen, die wiederkehrenden Muster herausarbeiten und nach dem Sinn eben dieser Muster suchen, bevor sich dann in der letzten Phase eines Gesprächs Alternativen und Lösungsansätze oft wie von selbst ergeben (siehe auch Abb. 2). Bei einem vieldimensionalen und vielperspektivischen Ansatz kann es natürlich nicht *die* („richtige“) Problemformulierung geben, sondern wir müssen uns entscheiden, aus welchen Perspektiven wir das Problem vor allem fokussieren wollen: aus einer subjektiven Innenperspektive, aus der Perspektive der Verhaltensweisen der Beteiligten, der Wertorientierungen und sozialen Normen oder der faktischen Bedingungen. Prinzipiell können alle Perspektiven berücksichtigt werden, aber eine wird sich vermutlich als wichtiger erweisen als andere. Dies ist meist davon abhängig, wo Klienten am ehesten eigene Handlungsspielräume erkennen können, denn es hat wenig Sinn, Probleme mit viel Aufwand zu präzisieren, an denen ohnehin nichts zu ändern ist, weil größere Kräfte am Werk sind. So lassen sich aufgrund ein und derselben Ausgangssituation dann Probleme auch auf den verschiedensten Konkretisierungsebenen formulieren, also auf individueller, sozialer, institutioneller oder gesellschaftlicher und politischer Ebene. All dies sind (möglichst gemeinsame) Entscheidungsprozesse von Mentor und Klient.

---

[13] Siehe hierzu Martina Gremmler-Fuhr (2004).

Wenn das Problem formuliert ist, kann man sich ein Stück weit davon und von der aktuellen Ausgangssituation distanzieren, ohne den emotionalen Kontakt dazu zu verlieren. In dieser *disidentifizierten* Perspektive (nach Möglichkeit mit Unterstützung einer „dritten Instanz“) können wir dann überfällige Gewohnheiten oder erstarrte Muster erkennen, die sich wiederholen, hochschaukeln, verstärken oder verdrängt werden - um im Untergrund weiter zu wirken. Das Erkennen und Akzeptieren solcher Muster - Verhaltensmuster, Reaktionsmuster, innerer (psychodynamischer) Muster, Beziehungsmuster, gruppendynamischer Muster usw. - ist ein Kernstück des Ansatzes; denn diesen Mustern kommt eine Schlüsselfunktion sowohl für translative als auch für transformative Lernprozesse zu. Sie können analog zu den Tiefenstrukturen einer Sprache verstanden werden. Aus diesen Tiefenstrukturen werden immer wieder neue Sätze generiert, und - wenn die Tiefenstrukturen erstarrt und nicht mehr angemessen sind - dann eben auch antiquierte oder unverständliche Sätze. Solche Grundmuster aufzudecken ist oft unangenehm, peinlich und frustrierend, denn es handelt sich beispielsweise um unrealistische Selbst-Auf- bzw. Selbst-Abwertungen, Schulddynamiken, Totschweigen von unangenehmen Tatsachen im eigenen Leben oder in dem einer Institution, um „Schwarze-Peter-Spiele“, Machtdynamiken (ohne dass wirkliche Macht zu verteilen wäre), Delegationen von ungelebten Anteilen an Beziehungspartner (die dann bekämpft werden) und vieles andere. Es bedarf daher der besonderen Unterstützung und der existenziellen Bestätigung durch den Mentor, um solchen Erkenntnissen nicht auszuweichen und sie akzeptieren zu können, denn nur dann können wir sie verändern.

Bevor solche Veränderungs- und Wandlungsprozesse jedoch greifen können, ist es meist erforderlich, dass wir die Probleme mit den ihnen zugrunde liegenden Muster *verstehen,* dass wir ihren Sinn ergründen. Wir gehen davon aus, dass jede inzwischen noch so abstruse Gewohnheit und jedes noch so zerstörerische Muster einen Sinn ergibt. Häufig liegt dieser Sinn darin, dass es Reaktionen auf schwierige Situationen in der Vergangenheit waren, die sich verfestigt haben.

In dieser dritten Phase des Prozesses geht es also darum, die größeren Zusammenhänge zu ergründen. Diese können historisch begründet sein, sie können in der Funktion, die ein Team in einer größeren Organisationseinheit hat, in einem Tabu oder in einer unmöglichen Aufgabe liegen, die eine soziale Einheit unter Stress setzt usw.

Bei der Suche nach Sinnzusammenhängen können wir rasch an Grenzen stoßen, nicht nur, weil sie etwa für die Klienten peinliche Fakten ans Tageslicht fördern, sondern auch weil die Vertragsbedingungen für die Beratung oder Therapie nicht gegeben und die Kompetenzen des Mentors nicht gewährleistet sind. Aber wir können immer bis an diese Grenzen gehen und ggf. auch gemeinsam neue Grenzziehungen vereinbaren.

Wenn dann einige plausible Sinnzusammenhänge gemeinsam heraus gearbeitet und erkannt worden sind, steht der Entwicklung neuer Perspektiven und Handlungsmöglichkeiten nichts mehr im Wege.

Diagnostik

Diese Art der Problembestimmung, der Mustersuche und der Sinngebung eignet sich sowohl für Therapie, als auch für Beratung im engeren Sinn. Zwar werden die Arten der Probleme stark variieren, je nachdem, ob wir etwa in einem psychiatrischen oder organisationalen Kontext arbeiten. Und jeweils können auch andere Modelle und Erklärungsansätze herangezogen werden, sei es aus der Psychoanalyse, der Verhaltenstherapie, der Systemischen oder humanistisch-psychologischen Therapie und Beratung oder aus Modellen der Organisationsentwicklung. Entscheidend für diagnostische Vorgänge im Rahmen des Ansatzes sind jedoch die folgenden Prinzipien und Kriterien:

- *Diagnose wird als ein Prozess verstanden, der immer wieder einmal durchgeführt wird.*
  Es gilt also nicht der Grundsatz „erst die Diagnose, dann die Behandlung“, sondern Diagnose ist ein Teil des gemeinsamen Beratungs- und Therapieprozesses. Damit stoßen wir allerdings sehr rasch an die Grenzen etwa eines Gesundheitssystems, in dem „Behandlungen“ nur aufgrund von eindeutigen Diagnosen mit „Krankheitswert“ finanziert werden. Hier müssen wir wohl in vielen Fällen Kompromisse eingehen.
- *Diagnose ist ein gemeinsamer Prozess zwischen Mentor und Klient.*
  Soweit wie irgendwie möglich versucht man, Verständigung zu erzielen, denn nur eine Diagnose, die von beiden Seiten akzeptiert wird, kann den Lern- und Entwicklungsprozess anregen und Richtungen weisen. Auch hier stößt man manchmal an Grenzen, wenn ein Einverständnis nicht oder nur schwer möglich ist und vielleicht sogar die Bereitwilligkeit zur Verständigung fehlt. Dann gibt es nur noch die Möglichkeit, die unterschiedlichen Positionen zu respektieren und die Konsequenzen zu akzeptieren, die beispielsweise in der Beendigung der Zusammenarbeit bestehen können.
- *Diagnosen erfolgen vielperspektivisch, vielschichtig, und sie legen Defizite ebenso offen wie Ressourcen.*
  Weder geht es also beispielsweise bei Einzelpersonen als Klienten nur darum, die Defizite aufzuführen (wie sie etwa in den Kriterienkatalogen von DSM und ICD stehen), noch nur um die Identifikation von Ressourcen, wie sie etwa von lösungsorientierten Ansätzen und der „positiven Psychologie“ favorisiert werden. Wir brauchen sowohl die Ermutigung durch das Bewusstsein vorhandener, aber nicht ausgeschöpfter Kompetenzen, als auch die Erkenntnis, dass Defizite vorliegen oder rigide und destruktive Muster wirksam sind. Diese beiden Aspekte - Defizite und Ressourcen - auszubalancieren, ist eine wichtige Aufgabe des Mentors, zumal viele Klienten dazu neigen, entweder nur das eine oder das andere wahrhaben zu wollen.

Das Entwicklungsspektrum, Erkenntnisse über translative und transformative Lernprozesse, die Möglichkeiten, zu regredieren oder auch wichtige Entwicklungsschritte überspringen zu wollen, all dies sind neben den verbreiteten psychologischen, gruppendynamischen, organisationalen oder sozialen Modellen wertvolle Hilfen dabei, die Unausgewogenheiten im lebendigen Geschehen zu erkennen, zu benennen und zu akzeptieren, damit wir uns immer wieder auf den Weg machen können - Klient und Mentor gemeinsam und jeder Klient für sich.

4. Strategien und Methoden

Am Schluss der Charakterisierung des Praxiskonzepts soll die strategische und methodische Vorgehensweise zusammengefasst werden. Wir haben solche strategischen und methodischen Aspekte schon mehrfach angedeutet und wollen sie hier nun kurz systematisch darstellen.

Dialogorientierter Austausch

Im Zentrum der Vorgehensweise steht das Gespräch, das sich soweit wie möglich an den Prinzipien und Kriterien des intentionalen Dialogs orientiert. Dies ist, wenn man so will, die Methode der Wahl. Aber solch ein Dialog sollte ja mehr einer Haltung und Einstellung entsprechen, als einem methodisch geplanten Vorgehen, denn die Art der Kommunikation und Beziehungsgestaltung ist immer auch Modell für alltägliche Umgehensweisen. Deshalb würden wir keine Maßstäbe für einen „optimalen“ Dialog oder Kontaktprozess angeben wollen, da dies sonst leicht mit einer Technologie der Gesprächsführung verwechselt werden könnte. Missverständnisse, Irrtümer, Irritationen, Konflikte und gelegentlich auch handfeste Streitigkeiten gehören zu unserem Miteinander dazu und können sehr konstruktiv sein, wenn die Grundprinzipien des intentionalen Dialogs nicht verletzt werden. Immer steht uns ja auch die methodische Möglichkeit der Meta-Kommunikation zur Verfügung.

Die Bedeutung des Dialogs als methodische Orientierung beim Vorgehen ergibt sich auch aus der Erkenntnis, die die Begründer der Gestalttherapie Frederick S. und Laura Perls sowie Paul Goodman (1951) erstmals formulierten: im aktuellen Kommunikations- und Beziehungsgeschehen spiegeln sich die Probleme und Schwierigkeiten des Klienten aus dem Alltag oft auf die eine oder andere Weise wider. Wir sind dann also quasi mitten im Geschehen, das die Probleme im Alltag bereitet, und können es gemeinsam auf ganz lebensnahe Weise untersuchen. Darin liegt ein unschätzbares Potential.

Natürlich können sich auch die Probleme des Mentors im Beratungs- oder Therapiegeschehen widerspiegeln. Deshalb ist es unverzichtbar, dass Mentoren eine Aus- und Weiterbildung genossen haben, in der sie gelernt haben, sich selbst zu reflektieren, ihre eigenen Muster und Macken zu erforschen und darüber hinaus zu lernen, wie man mit diesen Mustern und Macken in Bewegung und in einem kontinuierlichen Lernprozess bleiben kann.

Phasen des Gesprächs

Wie schon mehrfach angedeutet, konzentrieren sich das Gespräch und die gemeinsamen Aktivitäten nach anfänglichen Klärungen und Vereinbarungen darauf, die Situation gründlich zu erforschen, bevor sie interpretiert wird und neue Perspektiven entwickelt werden (Abb. 2). Eine besondere Herausforderung dabei ist es, die Anliegen und Situationen, die Klienten einbringen, nach der *phänomenologischen Methode* zu untersuchen. Es geht darum, die inneren und äußeren Wahrnehmungen in der Situation (wieder) zu realisieren und sie sehr deutlich von Interpretationen zu unterscheiden. Wer etwa ein akademisches Studium absolviert hat, musste lernen, Theorien zu rekonstruieren und mit ihnen zu jonglieren, obwohl sie kaum noch etwas mit Erfahrungen, geschweige denn den eigenen, zu tun hatten. In den meisten wissenschaftlichen Disziplinen herrscht zwar das hehre Prinzip: „Erst die Datensammlung, dann die Interpretation", dennoch werden Deutungen sehr rasch als Fakten ausgegeben: „Dies ist eine Übertragung, jenes ist eine Verdrängung der Aggressionen"; auch in der Politik glaubt man, über die Motive anderer Menschen, besonders der Gegner, gut Bescheid zu wissen, und gibt sie als Fakten aus. Deshalb ist mit der Unterscheidung von phänomenologischer Bestandsaufnahme und Interpretation eine große Herausforderung verbunden. Aber sie ist auch deshalb so wichtig, weil diese phänomenologische Bestandsaufnahme die empirische[14] Basis für Verständigung darstellt. Über Interpretationen und Erklärungsmodelle lässt sich dann trefflich streiten.

Bevor wir zur Sinnfindung kommen, empfiehlt es sich, die Tiefenstrukturen zu erschließen, also die Muster herauszufiltern. Man kann sich darüber streiten, ob dies nicht schon ein interpretativer Schritt sei. Wir zählen die Erschließung von Mustern jedoch noch zur Bestandsaufnahme, denn dabei bündeln wir die empirischen Daten und fügen sie zu Mustern zusammen. Dabei ist allerdings auch oft einige Fantasie erforderlich, die durch kreative Methoden angeregt werden kann. Damit wären wir dann beim Übergang zur eigentlichen Interpretationsphase, in

der wir Erklärungen suchen für die „Muster, die verbinden“,[15] um dadurch den tieferen Sinn zu finden und zu erfinden.

---

[14] „Empirisch" ist hier im eigentlichen Sinn gemeint, nämlich als „erfahrungsbezogen".

Den Abschluss bilden dann die Entwicklung von Einstellungs- und Handlungsalternativen sowie die abschließende Reflexion und Beendigung des gemeinsamen Beratungs-/Therapieprozesses.

Natürlich wird diese Phasenfolge in der Praxis nicht strikt eingehalten, es geht vor und zurück, und manchmal sind mehrere Schleifen notwendig, bis man zu einem befriedigenden Ergebnis gelangt. Aber dieses am Kontaktzyklus der Gestalttherapie angelehnte Modell ist eine sehr gute Orientierung für diesen vielschichtigen, komplexen und manchmal auch verwirrenden Prozess.

Methodeneinsatz

Abschließend sollen einige uns wichtig erscheinende Gesichtspunkte zum Umgang mit Methoden und Techniken noch einmal hervorgehoben werden:

Prinzipiell können alle Methoden, die für dieses professionelle Feld entwickelt wurden, zur Verwendung kommen. Allerdings gelten die grundlegenden Prinzipien des Dialogischen, der Entwicklungsorientierung, der Vielperspektivität und Vielschichtigkeit. Von daher ergeben sich einige Kriterien und Gefahrenhinweise für den Einsatz von Methoden:

- Methoden sollten so verwendet werden, dass sie sich nicht *zwischen* den Kontakt von Klienten und Mentor stellen. Entscheidend ist der unmittelbare Austausch, den man leicht vermeiden oder fremdsteuern kann, wenn man durch Methoden Strukturen setzt, die die normalen Sensibilitäten und zwischenmenschlichen Umgangsformen außer Kraft setzen. Beispielsweise ist es sehr problematisch, wenn eine Nähe und Intimität hergestellt wird, die der Beziehung und Situation eigentlich nicht angemessen ist. Aber gerade solche Methoden haben eine hohe Verführungsqualität.
- Methoden sollen eigenständige und nachhaltige Lern- und Entwicklungsprozesse der Klienten unterstützen. Alltagsnahe Methoden erleichtert die Integration, exotische erschweren sie oft.
- Viele experientielle und konfrontative Methoden[16] können Turbulenzen und tief gehende Erschütterungen auslösen, sowohl bei einzelnen, als auch in sozialen Einheiten. Sie sind daher mit größter Vorsicht zu verwenden und nur unter kompetenter Anleitung. Wenn Klienten zu heftig mit eigenen Erfahrungen, Gefühlen und „Wahrheiten“ konfrontiert werden, insbesondere, wenn dabei auch noch traumatische Erfahrungen berührt werden, können Re-Traumatisierungen und Dissoziationen die Folge sein.
- Methoden sollten als *Experimente* im Sinne des Gestalt-Ansatzes verstanden werden: die Klienten erproben etwas, nicht um es zu können, sondern um neue Erfahrungen zu sammeln. Bei jedem Schritt dieses Experiments wird daher die Aufmerksamkeit auf die gegenwärtigen Erfahrungen gelenkt, und dem entsprechend werden sie modifiziert. Sobald etwa größere Ängste entstehen und Grenzen gespürt werden, sind diese erst gründlich zu erkunden, bevor

---

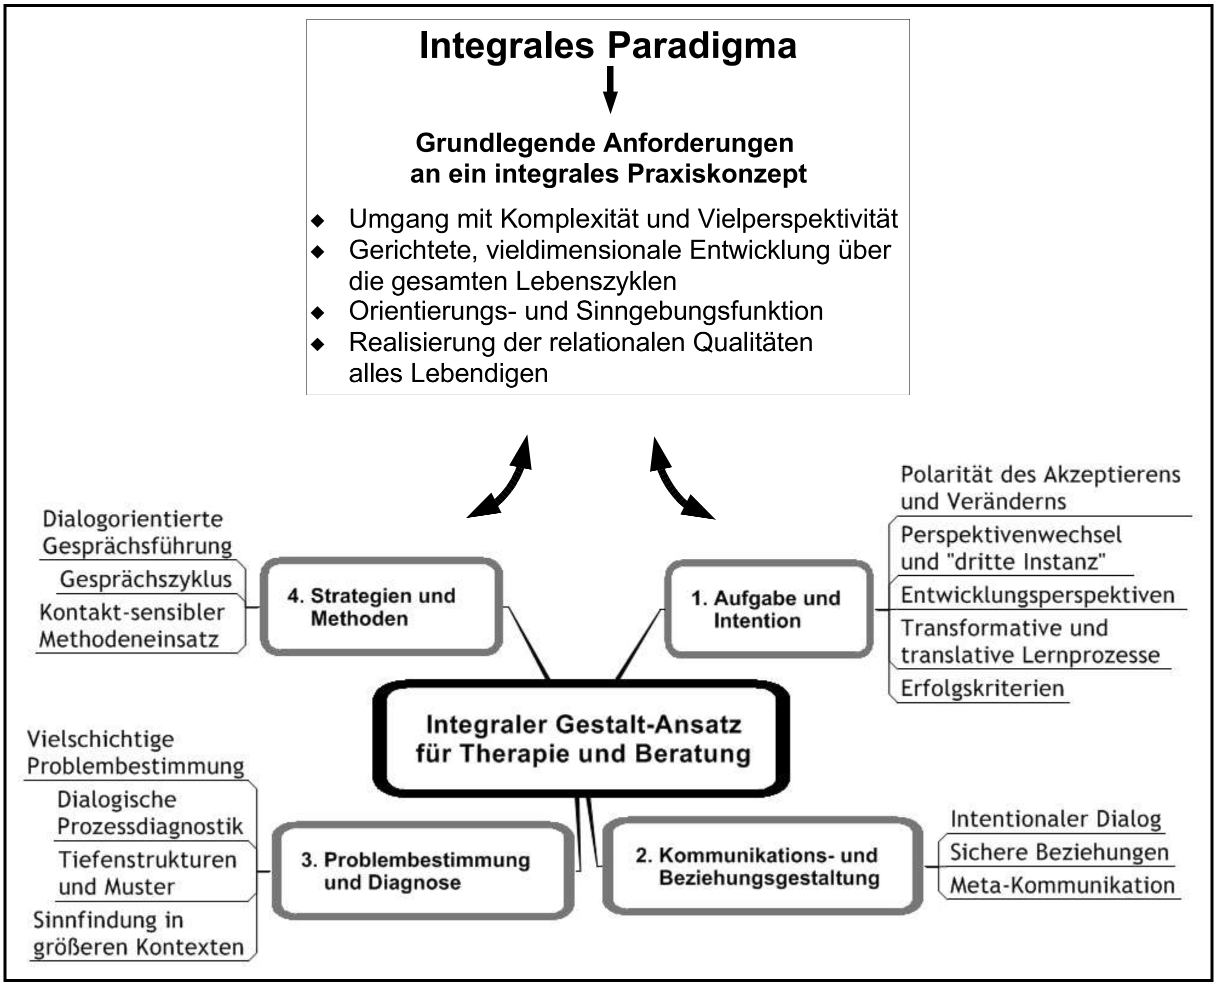
[15] Dies war der Begriff von Gregory Bateson, dem großen Anthropologen des 20. Jahrhunderts und „Vaters“ der Systemtheorie.

[16] Ausführlicher hierzu: R. Fuhr (2001).

man nächste Schritte tut. Denn Widerstände werden als Energien betrachtet, die in eine andere Richtung gehen, als die Beteiligten dies vielleicht geplant hatten. Diese Widerstände können uns den Weg zu wichtigen und tiefen Einsichten weisen. Es handelt sich dabei also um viel zu wertvolle Phänomene, als dass man Widerstände „durchbrechen“ oder „überwinden“ sollte.

Fazit

Fassen wir die wichtigsten Aspekte des Integralen Ansatzes als Landkarte zusammen (Abb. 3): Diese Art der Therapie und Beratung gehört sicher nicht zum Mainstream im professionellen Feld, schon gar nicht, wenn die allgemeine Maxime in Richtung rascher Effizienz, spektakulärer Methoden und Erlebnisqualitäten und messbarer Qualitätsmerkmale geht. Sicher gibt es eine Reihe von konzeptionellen Ansätzen, die in die Richtung des hier dargestellten Ansatzes



Integrales Paradigma
Grundlegende Anforderungen an ein integrales Praxiskonzept
Umgang mit Komplexität und Vielperspektivität
Gerichtete, vieldimensionale Entwicklung über die gesamten Lebenszyklen
Orientierungs- und Sinngebungsfunktion
Realisierung der relationalen Qualitäten alles Lebendigen
Polarität des Akzeptierens und Veränderns
Perspektivenwechsel und "dritte Instanz"
Entwicklungsperspektiven
Transformative und translative Lernprozesse
Erfolgskriterien
1. Aufgabe und Intention
Dialogorientierte Gesprächsführung
Gesprächszyklus
Kontakt-sensibler Methodeneinsatz
4. Strategien und Methoden
Integraler Gestalt-Ansatz für Therapie und Beratung
Vielschichtige Problembestimmung
Dialogische Prozessdiagnostik
Tiefenstrukturen und Muster
Sinnfindung in größeren Kontexten
3. Problembestimmung und Diagnose
2. Kommunikations- und Beziehungsgestaltung
Intentionaler Dialog
Sichere Beziehungen
Meta-Kommunikation

Abbildung 3: Übersicht über die Komponenten des Integralen Gestalt-Ansatz für Therapie und Beratung

weisen wie etwa die personzentrierte Gesprächsführung eines Carl R. Rogers (in der ursprünglichen, von ihm entwickelten Form - 1983), oder die Gestalttherapie in ihren Weiterentwicklungen,[17] oder das Konzept von Thomas Jordan (2002). Es bedarf also einiges an Pioniergeist, um im Sinne des Integralen Ansatzes arbeiten zu können. Dem entsprechend gibt es bisher auch kaum Ausbildungen dafür (eine Konzeption für solch eine Ausbildung darzustellen, wäre ein eigener Artikel). Meist müssen Aus- und Weiterbildungen individuell bei einzelnen Trainern zusammengesucht oder in Eigenstudien realisiert werden. Aber das könnte ein kreativer Weg zu neuen Ufern sein, der aufregend und vielleicht sogar sehr nachhaltig wirksam werden kann. Dazu braucht man dann eine große Portion an Geduld, Toleranz, und Risikobereitschaft. Es wäre daher hilfreich, wenn sich mehr von denjenigen, die in dieser Richtung arbeiten wollen, zusammenfinden und sich gegenseitig unterstützen könnten

Ein Integraler Gestalt-Ansatz für Therapie und Beratung
[An Integral Gestalt Approach for Psychotherapy and Counselling]

Reinhard Fuhr und Martina Gremmler-Fuhr

Summary

In this text we present our concept of psychotherapy and counseling in the frame the integral paradigm as we understand it. We briefly explain four requirements for a professional concept of this kind: the elaboration of complexity and multi-perspectivity, intentional development within an holarchical spectrum, offering orientation and meaning making structures, and realizing the relational quality of life as well as enacting intentional dialogues. We then discuss the differences and commonalities of the terms “psychotherapy,” “counseling” and “education” or “continuous training,” and we argue that they form a continuum with a major common basis as well as specialized competencies and strategies required. Even “teaching” increasingly requires a great amount of counseling by teachers and trainers nowadays, if they want to take into account what recent research on learning processes has proved. Our practical concept for the Integral Gestalt Approach which we have developed and evaluated over many years in quite different professional fields, from university seminars to health institutions, is then explored under four sets of questions or categories:

1. *Intentions and tasks*: The main task of the approach is considered to be the handling of the polarity between accepting whatever is on one hand, and supporting development processes along the specter of development on another hand. A major challenge here is to discover an “inner witness” or a “third position” that is able to empathetically acknowledge whatever is, without being entangled. Utilizing a developmental model of a holarchy with five levels, or paradigms, from pre-personal to conventional to rational to relativistic to integral has been very helpful in accomplishing this. We distinguish between translative and transformative learning processes which may be initiated – translative meaning an increase in competencies, transformative meaning a change of paradigms in one or more dimensions of individual or social development. The main criteria for success of the praxis is considered to be whether rigidified patterns or frozen structures can be turned to become fluid again, thus enabling clients to be involved in new and sustainable processes of learning and self-organization.

2. *Communication and mentor-client relationship*: Great emphasis is given to the realization of “intentional dialogues” and the establishment of safe and reliable mentor-client relationships, as these are considered to be the most favorable conditions for challenging learning processes, especially as, according to new research findings, relational qualities are learned along with the contents of any learning process.

SOME RIGHTS RESERVED

3. *Problem definition and diagnostics*: Problems can be defined on the basis of phenomenological exploration from many perspectives and at many levels of abstraction. Underneath these problems we may look for deep structures like repetitive dysfunctional patterns which then are investigated for their original meanings in wider contexts like personal history, social and organizational environment etc. Diagnostics are applied in the shape of recurrent mutual evaluation processes (in comparison to the staunch norm of "diagnosis before treatment"). Phenomena and deep structures are clearly differentiated from interpretations and explanations; traditional diagnostic models may be used by carefully adapting them to this integral approach.

4. *Strategies and methods*: Intensive contact processes guided by a four-phase model with a priority on exploration and self-reflection before the search for new perspectives and alternative solutions is considered to be the central method. Additional methods are designed in a way that they are close to normal live experiences in order to support the transfer of sustainable learning processes. Although trainings for this integral approach can build on a few established approaches to therapy and counseling, pioneering work is necessary as such an integral approach is still marginal. Therefore intensifying the networking of these pioneers is recommended.

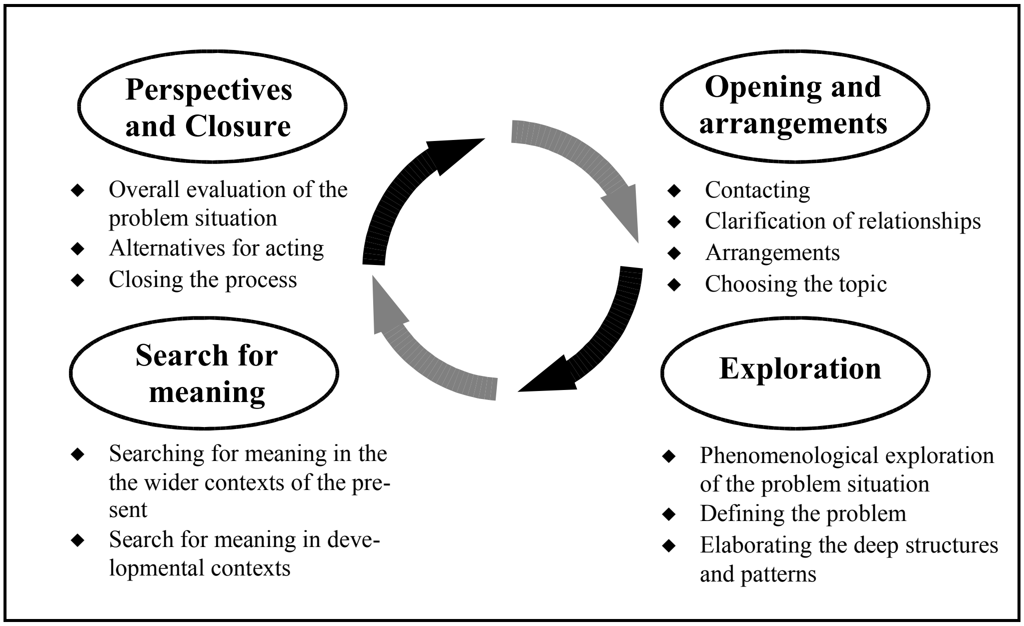
Pre-personal Development

Fig. 1: Five stages or paradigms of development



Perspectives and Closure
Opening and arrangements
Search for meaning
Exploration

Perspectives and Closure

- Overall evaluation of the problem situation
- Alternatives for acting
- Closing the process

Opening and arrangements

- Contacting
- Clarification of relationships
- Arrangements
- Choosing the topic

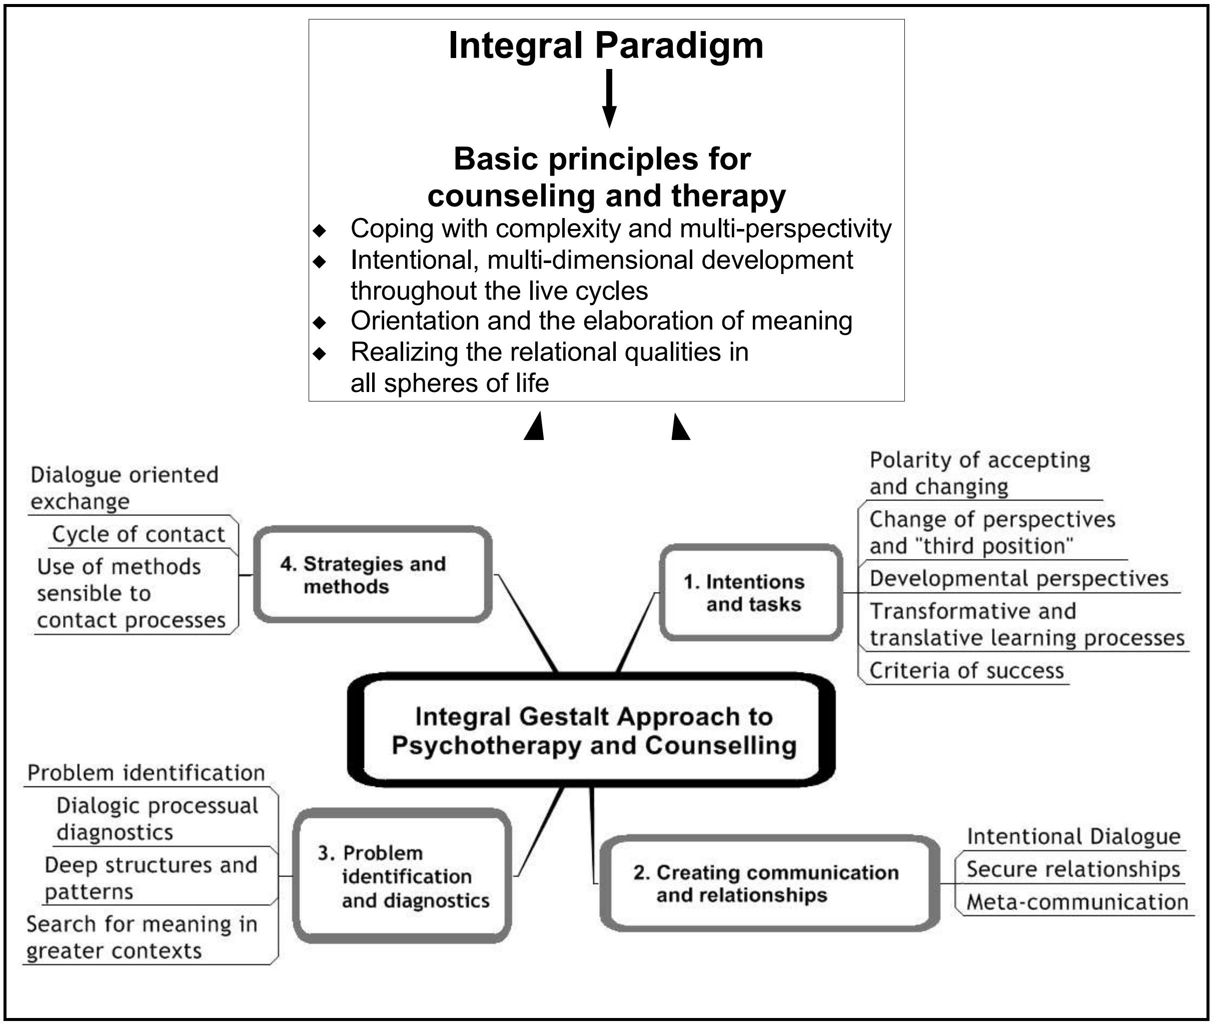
Search for meaning

- Searching for meaning in the the wider contexts of the present
- Search for meaning in developmental contexts

Exploration

- Phenomenological exploration of the problem situation
- Defining the problem
- Elaborating the deep structures and patterns

Figure 2: Cycle of contact in counseling and therapy



Integral Paradigm
Basic principles for counseling and therapy
◆ Coping with complexity and multi-perspectivity
◆ Intentional, multi-dimensional development throughout the live cycles
◆ Orientation and the elaboration of meaning
◆ Realizing the relational qualities in all spheres of life
Dialogue oriented exchange
Cycle of contact
Use of methods sensible to contact processes
4. Strategies and methods
1. Intentions and tasks
Polarity of accepting and changing
Change of perspectives and "third position"
Developmental perspectives
Transformative and translative learning processes
Criteria of success
Integral Gestalt Approach to Psychotherapy and Counselling
Problem identification
Dialogic processual diagnostics
Deep structures and patterns
Search for meaning in greater contexts
3. Problem identification and diagnostics
2. Creating communication and relationships
Intentional Dialogue
Secure relationships
Meta-communication

Book Reviews

Laszlo, E. (2004). *Science and the Akashic Field: An Integral Theory of Everything*. Rochester, Vermont: Inner Traditions International

Ervin Laszlo may be well known to many readers as a far sighted author; he was a founding member of the Club of Rome, founded the Club of Budapest, was affiliated with many Universities around the world, was nominated for the Nobel prize and he published many interdisciplinary books on questions of utmost relevance to those who are engaged in the realization and further development of the integral paradigm. And yet this is an unusual book.

Science and the Akashic Field is a most challenging attempt to summarize the foundations of a "theory of everything" on a solid *scientific* basis. His attempt stands in contrast, as Laszlo explicitly maintains, to Wilber's *Theory of everything* – as "... he does not offer such a theory" - which is, as we will see, not quite fair (p. 2). Laszlo builds his claim on his 40 years of interdisciplinary research as a professor of philosophy, systems theory and futures studies. At the core of his theory of everything is the *connectivity hypothesis*. In simple terms it means: in our universe (and in all other universes) everything is connected with everything in the information-conserving and information-conveying cosmic field of the quantum vacuum. This vacuum fills most of the universe (not matter!), and the vacuum preserves all information ever generated without any need of time and space or a medium. Therefore the total sum of information is immediately available everywhere and at any time if it can be "received" and decoded by resonance. Of course, Laszlos says, amoebas have more resonance with other amoebas than with human beings and vice versa. But in principle the experience of all predecessors can be used by every form of life and evolutionary challenge. This also means that evolution is *not* essentially based on trial and error, as the probability that life could have come to existence only in this way would virtually be zero.

Laszlo calls this quantum vacuum with all universal information the Akashic field or A-field, according to the Indian philosophy's concept of the Akashic Chronicle and along with thousands of years of the knowledge of sages, particularly in the East. This A-field cannot be observed, but its effects can be observed, measured and evaluated by scientific methods; and Laszlo quotes quite a number of examples and proofs of theses effects from cosmology to quantum physics, biology and consciousness development. Most of it is written in a way that even someone like me who is not very familiar with quantum physics, the leading edge of biology research and the details of complexity theories, can somehow understand. It is still not quite easy food.

The consequences of this basic hypothesis are far reaching:

- Consciousness and matter are just two aspects (interior versus exterior) of one and the same existential ground of everything (here and at a few other places Laszlo comes to quite similar conclusions as Wilber in spite of his initial devaluation of him). There is a free floating primary consciousness and unstructured energy field which continuously evolves and generates the manifold forms of our universe (among innumerable other universes).
- Nothing we experience and think is lost, it is available for all times, and others can built on it if they link with it through resonance with the corresponding wave functions.
- The root of our knowledge is not conserved in our brain or mind but in the A-field where everything is available (a thought that also turns up in Sheldrake's theory of morphic fields –

SOME RIGHTS RESERVED

another challenging theory which is usually ignored or depreciated by traditional science - and is not mentioned by Laszlo either).
- Evolution is “directed:” from the original primary consciousness and unstructured energy field to continuously more complexity and coherence; i.e. evolution is neither wanton nor determined and produces its own unfolding.

This theory may throw new light on many problems and phenomena of our lives, as Laszlo explains in an exemplary way: the brain – mind problem, the question of immortality (only the contents of our consciousness are immortal, nothing else), para-psychological phenomena and altered states of consciousness etc.

This book takes up many threads that show the way towards an integral paradigm, and to an encompassing and interdisciplinary theory at a very abstract and yet substantial level. Laszlo connects these strands in what I would interpret as a kind of legacy in the shape of a coherent and awe inspiring whole. Of course there remain many questions and gaps in his theory of everything - or rather: many very fascinating questions can be generated on this basis.

One of the most important questions for me would focus on what this could mean for learning, transformation and social change. For example, it has been obvious for a long time now that we cannot fill the minds of students (and those of people in general) with new ideas and knowledge like an empty bucket. Instead, incorporating Laszlo's idea, we have to produce the best conditions for resonance with and realization of the knowledge readily available in the A-field. This would be of utmost relevance to all educational endeavours from school teaching to community development; we would have to motivate ourselves and others to produce new knowledge of our own and link it with our experience on the basis of what is available; and we could dispose of most of our training programs and methods that aim at “transporting” knowledge into the heads of learners. Many alternative and humanistic pedagogic approaches from Paolo Freire to Ruth Cohn or Confluent Education and the insights of new neurological research findings which all tend towards similar conclusions could be incorporated with Laszlo' theory. How this could be done in a way that promises to be much more meaningful and effective than traditional as well as modern “technical” approaches to learning would indeed be a huge field of research and further studies.

And of course strong resistance will also be provoked by this theory of everything, and we will have to find ways of handling it. When asking a distinguished and rather open-minded neuroscientist whom I know personally, whether he could tell me anything about the assumption that the roots of our knowledge may not be stored in the brain functions and in our minds but rather in a readily available field of knowledge in the quantum vacuum to which we may establish resonance, his reply was short: “This sounds like a rather abstruse theory and of little use for me!” I will still continue to discuss this topic with him, as my resonance with Laszlo's theory of everything was a different one indeed.

Reinhard Fuhr

Ferrer, J. N. (2002). *Revisioning Transpersonal Theory. A Participatory Vision of Human Spirituality* Albany, NY: State University of New York Press

People will want to dismiss this important book by Jorge Ferrer. Because Ferrer writes by carrying us through his thought *process*, there are many easy ways to dismiss it. In the beginning, he embroils himself in the familiar epistemology-ontology nightmare of postmodernism; and not surprisingly, despite his numerous "turns" to integrate the partiality of the one by moving toward the other, he fails to extricate this philosophical *Excaliber.* In the meantime, he builds a strong critique of the Cartesian moorings of other transpersonal models, by highlighting Wilber's and faulting it for the same problem: having built an ontological model based on a priori principles, and failing to negotiate the subject-object divide.

The SDi people[1] will (and have) dismissed Ferrer's book as a kind of last gasp attempt to salvage the pluralist perspective – the singular square on the board game of a current transpersonal culture of critique that says "do not pass Green."[2]

In objection to the perennialist's notion of an absolute structure of transpersonal development, Ferrer introduces a "participatory" component of spirituality: "… transpersonal phenomena are participatory events that involve ways of knowing that are presential, enactive, and transformative."

Ferrer claims his participatory model repairs two important fault-lines of the perennialist versions of how we "know" namely, the Myth of the Given (one cannot know "things as they are"), and the Myth of the Framework (the spectrum of spiritual experiences cannot be described by any one set of a priori (deep) structures). By incorporating the three features of the participatory model, we come to see instead that; 1) we *participate* **in** the ways things are (presential),[3] 2) we each constitute a unique set of human development through our *participatory situation with/in the world* (enactive),[4] and 3) participatory knowing is transformative.[5]

Ferrer's intentionally transparent exposé into a more pluralistic version of transpersonal theory was for me a pleasure to read. His writing engaged me, as if we were having one of those endless conversations that go through the night. And then, as if the dawn had come around, and roused us from the seriousness of our philosophical sleep, Ferrer stretches out his pluralistic thought, to "relax into a spiritual universalism." In the last chapter, which reads like a coda, he writes:

> In this book, I have introduced a participatory spiritual pluralism as a more adequate metaphysical framework than the perennialism typical of most transpersonal works. … I should stress here that I do not believe that either pluralism or universalism per se are spiritually superior or more evolved. And it is now time to make explicit the kind of spiritual universalism implicit in the participatory vision.

---

[1] "Spiral Dynamics-Integral" community who have incorporated Don Beck's version of Spiral Dynamics (itself a digest version of the work of Clare Graves' research on human development) into Wilber's AQAL (All-Quadrants, All-Levels) model of integral theory.

[2] Consider, for example, Ken Wilber's comment to Daryl Paulson's about the book (quoted in Paulson's review at http://wilber.shambhala.com/html/watch/ferrer/index.cfm/).

[3] Participatory knowing is knowing by presence or by identity … in a transpersonal event, knowing occurs by virtue of being (p. 122).

[4] Participatory knowing … is an enaction, the bringing forth of a world or domain of distinctions … p. 123

[5] ... a transpersonal event brings forth the transformation of self and world … and in turn draws forth the self through its transformative process in order to make possible this participation. p. 123

> There is a way, I believe, in which we can legitimately talk about a shared spiritual power, one reality, one world, or one truth.
>
> … my sense is that *the dialectic between universalism and pluralism, between the One and the Many, displays what may well be the deepest dynamics of the self-disclosing of Spirit.*[6]

"Ahhh," I sighed, as I reached out and stretched with him, "why didn't you just say so in the first place?" I hope Ferrer is planning a sequel – picking up in the next book where he's left us with this one.

Bonnita Roy

Frick, D. (2004). *Robert K. Greenleaf. A Life of Servant Leadership.* San Francisco: Berrett Koehler

I picked up a biography recently, tired of books on leadership, developmental theories, integral theories and the like that have been the staple of my reading diet for too long now. At the same time, I didn't stray too far from my usual interests. Last year, I read Robert Greenleaf's *Servant Leadership*, and was inspired by his vision of being a servant first, and then from that orientation of service choosing to lead. His thoughts on the subject appeared to have as integral a perspective on life and leadership as anyone I had come across. My interest thus piqued, I was curious to gain insights into this perspective from understanding the life behind them.

Don Frick's approach to biography veers from the standard account of the noteworthy life. He gives the reader a glimpse into the man behind the philosophy of servant leadership that has inspired many through vignettes that often focus as much on the context of Greenleaf's life as the events. The reader is taken through many tangents that serve to illuminate small aspects of the picture. Tales of Eugene Debs, the socialist presidential candidate and union activist, of Theodore Vail's presidency at the communications giant American Telephone and Telegraph (AT&T), (where Greenleaf worked for over thirty five years), the Quaker movement in America during World War Two, and a host of other fascinating sidelights all illuminate the context in which Greenleaf's thinking developed.

Frick does provide descriptions of interesting events and activities in Greenleaf's life. His rapid rise within AT&T, his influence on a wide range of ventures; such as the reorganization of IBM under Thomas Watson Jr, the early formation of T-groups and the development of personnel assessment and training. The cast of characters Greenleaf met with and learned from reads like a whose who of the times. His influence on the formal leadership at AT&T through a succession of Chief Executive Officers was enormous. His seminal influence on many projects that he consulted on, and his founding of the Center for Applied Ethics (later the Robert K. Greenleaf Center for Servant Leadership) serve to further magnify the impact of the quality of his thinking and presence.

Impressive and fascinating as all of this is in itself, it is only the gateway Frick provides to invite the reader into glimpses of the depths of Greenleaf's being. What drew me on in this narrative was the way Frick enabled me to feel like I was on the inside, temporarily able to perceive the world like Greenleaf. And what did I perceive in those moments? I saw life as a continuous inquiry into wholeness. Greenleaf described his philosophy as a “hole in the hedge” approach to life. Whenever he encountered anything of interest, he would slip through the hole in the hedge of everyday life and perceptions, and explore how some new person or idea could reveal another component of the deeper wholeness.

---

[6] pp. 99-101

From this deeper encounter with Greenleaf the man, his seminal thinking on leadership came to life for me. I could now see the notion of the servant as leader, being a servant first who then chooses to lead, as an outgrowth of how Greenleaf lived his own life. This journal’s lead article and Kai Hellbusch's contribution discuss Jean Gebser’s opening of the field of integral thinking. There he is quoted as characterizing the difficulties in representing integral by saying that “this world[view] goes *beyond our conceptualization*.” In the writings of Robert Greenleaf, and the description of his life that stood as a testament to this writing, there is a clear presence of a wholeness beyond our capacity for conceptualization. Frick’s biography manages to provide glimpses of this wholeness as it took form in Greenleaf’s life, and in this way appears to me to be as good an example of what it is to be integral as any I have encountered.

Editorial

Another Step: The Evolution of Integral Review

Welcome to the second issue of *Integral Review*. Since our inaugural issue one year ago, we have expanded our horizons and perspectives in many ways. It has been a pleasure to make new acquaintances with authors submitting to IR, work with a growing cadre of outside reviewers, and welcome a new member to our editorial committee. These activities have generated plenty of learning for all of us involved—authors, reviewers and editors—and have fueled our evolution as a journal.

We would like to take a moment to express our sadness at the sudden passing of our former Editor-in-chief, Reinhard Fuhr, this past December. As the one who had the initial conception for this journal, Reinhard articulated its vision, and guided the first issue to fruition. He mentored and initiated me into this world of editorial process and perspective, and many times in the past months I have reflected on how he would recommend handling situations. I regret not having had more time to benefit from his wisdom. Thomas Jordan, who knew Reinhard personally, has provided us with a memorial reflection that provides some insight into his character and accomplishments. The editorial committee of *Integral Review* gratefully dedicates this issue in memory of Reinhard.

We would also like to welcome Bonnitta Roy to our editorial committee. Bonnie had been an outside reviewer for IR and we are glad that she accepted the invitation to join us in this work. You can learn more about her on the Editors page.

Finally, we look forward to the launch of AQAL: Journal of Integral Theory and Practice. The publication of this new journal from the Integral Institute/Integral University will add another voice and venue for public discourse on all things integral. While conversations with AQAL's editor-in-chief have revealed differences in the specific missions of IR and AQAL, we share a common vision for furthering high quality public discourse on integral approaches to human endeavors. Starting with our next issue, IR will publish reviews of and/or responses to articles that appear in AQAL. This offers a peer reviewed venue for the exchange of ideas to extend and develop integral discourse.

The process of accompanying authors (including ourselves) through processes of reflection and revision has been full of learning for myself and the IR editorial committee. This work has facilitated new insights into how the concept of integral is understood and applied. In turn, these insights add to our repertoire of ways to support authors' efforts to communicate their thoughts, research and praxis. This iterative and ongoing process of action inquiry guides IR's work, and frames the ideas and experiences described in this issue, like a series of snapshots in the evolution of integral perception, understanding and application.

On the Contents of Issue #2

This issue of IR opens with a short mixed genre piece entitled *It is I Who both Breaks and Binds.* Andrew Campbell shares a combination of art, process, email exchange, and photography that offers glimpses into the creative process and invites revisiting and reflecting.

SOME RIGHTS RESERVED

Next is a short piece by Mark Gerzon, *Integrity, Integral Vision and the Search for Peace*. Mark offers an integral vision for handling conflict. He points out how this integral approach is based in integrity and wholeness, and offers practical examples of how conflict can be transformed.

This is followed by a reflective piece from Nathan Harter, *The Springs of Leadership*. Nathan invites us to expand our notions of leadership activity to include contemplation. He introduces us to *ensimismamiento* as a core practice of leadership that sets it apart from the more mechanical tasks of such roles.

We then offer two pieces by Sayyed Mohsen Fatemi. In *Passionate Winking*, he offers us a creative mix of poetry and philosophy. This piece takes the reader back and forth between modes of discourse, opening up a window into his world. The companion piece, *Avenues of Mysticism*, well, it is poetry, so I'll keep any interpretations to myself!

From these shorter works, we turn to Russ Volckmann's interview with Ian Mitroff, titled *A Transdisciplinary Mind*. In this interview, Mitroff reveals the path he took through life, and how various influences helped open him to more integral perspectives. The transdisciplinarity of his mind is clearly evident throughout, as when he shows why the entire notion of disciplines is an increasingly incoherent and dysfunctional way to organize knowledge. This fascinating interview also covers his work as the father of crisis management, and his research into the spiritual side of corporate America.

For an integral approach to organizational learning, Wendelin Kupers offers *Integrales Lernen in und von Organisationen*, a German language article that invites us to take learning in and of organizations as a relational event and integrative process. He applies an integral framework to notions of learning and how they can be applied in organizations, and introduces useful distinctions that help us perceive the value in organizations actually learning.

Nathan Harter offers another look at the contemplative side of leadership with *Voegelin's Ladder*. Here he argues that leadership implies spirituality, and uses an early notion of development found in the work of Eric Voegelin to provide a framework for relating the two. He shows how spirituality manifests as purpose and aspiration, making it practical and relevant for understanding and practicing leadership.

More Perspectives, New Politics, New Life: How a Small Group Used The Integral Process For Working On Complex Issues is the title of Sara Ross's report on a small research project conducted with a group of citizens wishing to address issues of local concern. It outlines background to the process and the steps involved in it, and then how the group used those steps to generate new perspectives on their issues and for some, their lives. This article complements a longer research report included in this issue of IR.

Another application of integral thinking is presented in my (Jonathan Reams) interview with Karen Kho, *Plain and Integral*. Karen describes her work in the green building industry in California, where she and her colleagues have been able to adapt and apply integral thinking, perspectives and frameworks to their work. The success and growing interest in the work done there demonstrates the value of utilizing integral approaches for practical challenges.

Michel Bauwens' French language article *Le Peer to Peer: Vers un Nouveau Modèle de Civilization* introduces his hypothesis about the birth and emergence of a new social formation, called "peer to peer." He believes that this has profound implications for the transformation of our current form of market economy. His description covers peer to peer modes in both production and governance.

Sara Ross presents *Perspectives On Troubled Interactions: What Happened When A Small Group Began To Address Its Community's Adversarial Political Culture* as a more detailed companion to *New Perspectives*. This extended length research report includes a literature review, methodology, and significant detail on the impact this process had on individual participants. The insights gained from this research have wide ranging value and could be applied in many domains.

Finally, we close with Tom Murray's *Collaborative Knowledge Building and Integral Theory: On Perspectives, Uncertainty, and Mutual Regard*. This article applies Murray's understanding of how integral theory's approach of methodological pluralism positions it to deal with the "epistemological indeterminacy" that impacts all knowledge building communities. He provides detailed critiques from examples of current public discourse in the integral community, and then shows how issues of mutual understanding, agreement, and regard impact these exchanges. He provides useful distinctions for understanding theory building issues, and suggests practices to improve the quality of discourse in integral theory development.

The process of generating this second issue of *Integral Review* has been rich and rewarding. We hope that you will find value in the range of offerings presented here, and share your discoveries with friends and colleagues. We have authors who are already at work on submissions for issue 3, and look forward to speeding up our publishing schedule. We will also be happy to entertain publication of responses to the articles IR publishes, and hope to make this a robust forum for integral dialogue.

Jonathan Reams
(Editor-in-chief)

In Memoriam: Reinhard Fuhr

Thomas Jordan

With the premature death of Reinhard Fuhr (1939-2005), the community of integral scholars lost one of its most earnest and grounded members. Reinhard spent thirty years as a teacher and researcher at the Department of Education at the University of Göttingen, Germany. He was also a gestalt therapist and a prolific author of books and articles on gestalt therapy (primarily in German), mostly together with his wife Martina Gremmler-Fuhr.

Reinhard applied integral frameworks in three interrelated fields, namely gestalt therapy, pedagogy and conflict management. Reinhard and his wife Martina worked closely together on using integral perspectives to expand and develop gestalt therapy and to enrich the field of communication in conflict management. Together they wrote a comprehensive and innovative textbook on conflict management (Fuhr & Gremmler-Fuhr, 2004), where the integral perspective is used to discuss levels of development in interpersonal communication and where integral principles are used to discuss the processes of conflict resolution. Reinhard also invested considerable energy in developing an integral approach to his own academic field, that of education (see the list of selected publications below). Most of Reinhard's and Martina's work is unfortunately not available in English. One small exception is a little gem of an article on the phenomenon of emotional reactivity in conflicts, where an integral framework is used in a creative way (Fuhr & Gremmler-Fuhr, 2003).

In his role as a lecturer at the university of Göttingen, he introduced many students to integral frameworks and supervised a number of undergraduate theses drawing on integral theory. A small community of former students formed over time and there is good hope that we will hear more from some of them in the future.

I came to know Reinhard as a person who combined a thorough familiarity of integral theory with a capacity for independent critical reflection, grounded in his very long experience with clinical work. Reinhard would not be swayed by lofty and grandiose ideas and visions, but always looked for ways of integrating what is with what might be. I am sad that he didn't get another twenty years, who knows what riches he might have been able to offer us . . . But I gratefully receive what he offered and also look forward to Martina's coming work, e.g. a doctoral dissertation on relationships from an integral perspective.

It is I Who both Breaks and Binds

Art ~ Prose ~ Photography

By Andrew Campbell
with Sara Ross

Spanda is the vibration or pulsation of pure consciousness; it is the rhythmic cycle of emanation and dissolution. Although this power is one it is both expansion and contraction. It may be subject to a eulogistic hymn or a philosophical analysis. It is you radiantly manifest – you make all things unfold; contemplating yourself you contemplate the universe. As you pulsate, inebriated with the juices of aesthetic delight of your own nature, the phenomenal world emerges into manifestation.

Ambadas (Artist) *The Hindu* October 30th 1988

It is I Who both Breaks and Binds

Artwork from an original by Sara Ross mediated and entitled by Andrew Campbell

Last evening seven or so pink doves settled into the top of a tree to bathe in the light of the sun. I cannot think they wanted or needed the warmth. So I say they wanted to simply sit in the light of the sun. It takes a certain mindfulness to see they are the sun, and that in each black eye is each bright sun – many in one >< one in many.

I have taken a chalk i(n)mage you sent me this summer. I have both pulled and pushed it, broken it and repaired it with light and electricity, choice and chance so that it is irreversibly what you see. It is no more than what you see and no less than what you see. It is its own perfection and so it matches your own perfection.

I spread it over the one page for you, like a carpet and I doubled it and joined it, which you will see can become a method of movement in itself ;-) in that it is a path and feet may walk upon it to eternity and it can never be worn out. It is an irreversible outcome of your creative essence.

My part is no more than that of a humble 'carpet maker' - you... a wandering princess who commands the sun be made so and put before her bare feet.

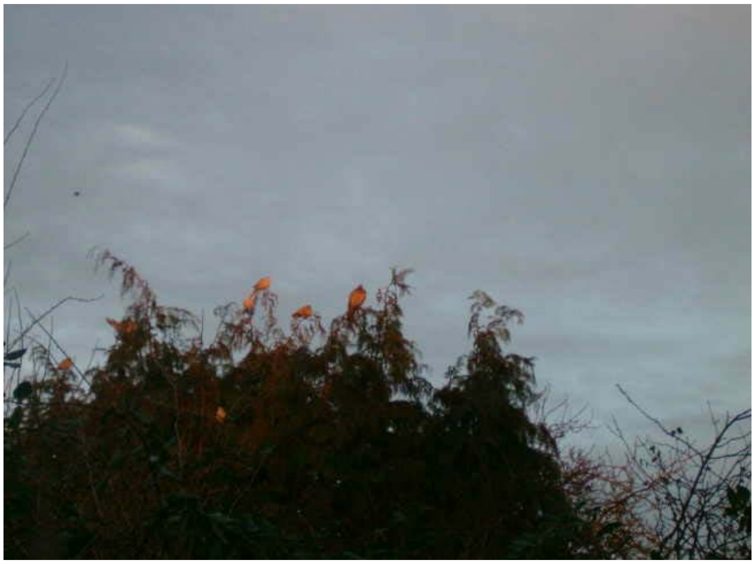
Love,
Andrew x

Andrew!
What you have done and what you have said about how you have done it is profound . . . is manifesting what Ambadas wrote. . . . is the ever unfolding and enfolding movement of cosmos . . . rolled out before us in an exquisite carpet of energy that unfolds and enfolds and it is all one coherent story telling itself, doing itself, becoming itself. . . beyond these words, I am speechless with savouring it All. . .!

Love,
Sara UX

The carpet is a single thought, your single thought. I merely unfolded what was enfolded and sprinkled some colours into it. Every thought is like this carpet and every carpet contains ten thousand more thoughts. As you might journey into such a pattern of patterns, you might become mesmerized by it all and you would have to let go of all your thoughts and sense impressions, and you might become tired, and you might fall asleep and then all the ten thousand become ten thousand more each upon and within each and so on, but they might appear in such a dream-moment as just one thing, say, seven doves sitting in the winter sun, waiting for the dark knowing that the song of the song is in the morning.

Love,
Andrew xx



seven doves in a winter tree

Oxford, January 2006

Andrew Campbell Trained under the visionary artist Leonard McComb, D.Phil., R.A. (Keeper of Pictures) at Oxford and London and studied as a pupil of Mnr. A.M. de Lange, M.Sc., Goldfields, Pretoria, RSA - the discoverer of the Seven Essentialities of Creativity. My artwork is an integral part of the project known as Presence and Presencing, viewable at the www.dialogonleadership.org web site.
Email: ACampnona@aol.com

This piece is a co-creation in the style alluded to by Ambadas out of the Hindu traditions when he wrote, "Art to me is a happening and performance, an instant plunging, flirting ;-) and merging, with life, with both its being and becoming it. All that is here is but a charge in celebration. Things, objects are only focal points of here and now, in a whole that stretches infinitely, the feeling of unlimited envelopes, something mystical in a sense. Like a dancer, who performs, not for herself but for the spectator. The dancer is the spectator and the dance."

Integrity, Integral Vision and the Search for Peace

Mark Gerzon

> *The purpose of life is . . . to know oneself. We cannot do so unless we learn to identify ourselves with all that lives.*
> — *Mohandas K. Gandhi*[1]

I have never seen a conflict in which everyone could see the *whole*. On the contrary, I have only experienced conflicts in which some, and usually all, of the "part-ies" were identified with the "part." They were, literally, "partisan."

This is the basic human condition, the natural worldview of organisms that are born, live and die as seemingly separate entities. When our bodies shout "Me first!" — we listen. We are wired to survive, and to put our survival before others (an instinct which can be trumped by only one other: protecting our offspring). As a natural extension of our survival instinct, we tend to care more about the welfare of those near and dear to us than those who are, by whatever definition, far away. Our language provides convenient words for each: the first we call "us;" the latter, "them."

The challenge of integrity—or integral vision, which literally means "seeing" or "holding" the whole—is to balance this very natural allegiance to the part ("partisan") with an allegiance to what it is but a part *of*.[2]

If we think of a conflict which affects us—whether personal, professional or political—we notice that we tend to be more identified with "I" than "you," and more with "us" than "them." This tyranny of pronouns not only affects our tongue; it is in our cells. Integrity is our fallible, human attempt to counteract this in-built self-centeredness by cultivating a whole-centeredness. (It is worth nothing that in English the word "partisan" is used very often, particularly in election years, but that we have no word for "wholisan").

This intention toward integrity—from the Latin *integer*, meaning "undivided, untouched whole—is our first, critical step toward transforming conflict. Because of our commitment to "hold" or to "see" the whole conflict, we can become part of the solution to the conflict rather than just adding our energy to it.

At a dialogue retreat for US House and Senate staff in the summer of 2002, for example, a veteran chief of staff for a Democratic congressman pulled me aside. "We have been told to oppose all Republican amendments," she whispered to me. "I am told that they have been told to oppose all Democratic amendments. I really have a problem with that." Then, looking over her shoulder to make sure no one was listening, she added: "*I don't think that's leadership*!"

[2] I am grateful to Ken Wilber for conversations over the years that have helped me understand the concept "integral," and to apply it to my own thinking about leadership.

SOME RIGHTS RESERVED

This middle-aged African-American woman, like so many leaders with whom I have worked around the world, sensed the need for political leaders to hold themselves to a higher standard. She believed that leadership meant more than automatically taking one “side” against the other. She wanted the US House of Representatives, the institution to which she was dedicating her professional life, to be “the people’s house.” For this reason, she wanted both Democrats and Republicans to work for what was best for America, not just what was best for their own party.

Integrity in the House of Representatives can make the difference between a partisan free-for-all and a coherent bipartisan legislation. In your house or mine, it can make the difference between endless squabbles that lead nowhere and a family life that moves through conflicts towards greater understanding and harmony. Similarly, in organizations and communities, integrity in leadership can make dialogue highly productive and pull remarkable synergy out of the jaws of conflict. Just as it is hard for our representatives to care for the whole House, so is it hard for parents to care for the whole *family*, or for a mayor to care about a *whole* town, or a CEO to care about a whole *company*, or for a president or prime minister to care about a whole *nation*. (No wonder it often seems to utopian to believe that we can care for the whole *world*!)

To apply this concept of integrity to your own life, think about a recent conflict in which you have been involved, and you will notice how partisanship was absolutely central to it.

- After a period of little communication, my brother and I finally agreed to meet to try to work through an incident that happened at a family gathering. It had been so unpleasant that it left us feeling estranged for months. When we recalled the incident, he remembered the part when I had shouted and been rude, and I remembered the parts where he had been arrogant and judgmental. Each of us, however, had “forgotten” our own misbehavior until the other pointed it out.
- When planning the retreats for the US House of Representatives in the late 1990s, the Democrats referred repeatedly to arbitrary and unfair decisions by the Republican majority. But the Republicans defended themselves by pointing out that, during the several decades when the Democrats were the majority party, they had done the same things.
- In April 2004, Americans’ doubts whether the war in Iraq made sense increased sharply, in large part because it was the deadliest month since the war itself. 136 American troops died between April 1 and April 30. (To make matters worse, photographs leaked to the press of flag-draped coffins being shipped home only increased the number’s emotional impact.) During the same month, at least 1,361 Iraqis were killed—a ratio of Iraqi to American deaths of just over 10 to 1. Despite the exponentially higher figure of non-American deaths, however, it was not cited as a reason to question the war. The reason cited was the much smaller number of American deaths.[3]

(Note: For most of the Arab world, of course, the numbers have precisely the opposite weight: they do not focus on the American deaths, but on the deaths of fellow Muslims. War is almost always fueled by the symmetrical blind spots of the combatants who, naturally, identify more with “our” deaths than “theirs.”)

In each of these three cases, we can see the human tendency to magnify the meaning of one’s own pain or loss or hurt and to minimize the other’s. Integrity as a value stands for our commitment to recognize this human tendency and to transcend it, as best we can, in order (following Gandhi) to "learn to identify with all that lives."

---

[3] “Iraqi death toll much higher,” Lee Keath, DC 5/1/2004

Just as a whole number (or integer) is different from a fraction, the whole is different than a part. The challenge of integrity is to recognize that, while each of us come from a particular part, healing conflict requires that we seek to identify with the whole. As astronaut Russell Schweickart put it after repeatedly circling our small planet, we need to identify with "the whole thing."

For those of us who have not spun around the planet like a whirling dervish, identifying with "the whole thing" remains elusive on every level of our lives. In families, we marry or are born into a particular role (first-born child, second wife, etc.). In schools, we are enrolled in the system in very different ways (student, teacher, administrator, etc.). At work, we have very different job assignments and fit into the hierarchy in specific roles (chief financial officer, vice president for marketing, director of R&D, etc). And in public life, we all have different economic interests and political affiliations (lobbyist, legislator, citizen activist, etc).

On this level of assigned roles, we are *expected* to view the whole through the lens of the part. To put it in the language of our era, we are "hardwired" and "programmed" to be partisan in virtually every conflict of our lives. We are supposed to take sides with *our* part against the *other* parts. So the most fundamental dilemma of leading through conflict is how to hold the whole in our hearts while, at the same time, tending to identify much more strongly with one part than another.

During my training as a family therapist, for example, one of the most basic lessons my supervisors taught me was to identify with the whole family, not with a particular member. It is so easy to enter a "family system" and, usually unconsciously, feel very close to one person—say, the lonely teenager whose parents are critical of him or her. If family therapists get "sucked in," and consequently see everything through the eyes of one family member, it is unlikely that they will be effective.

Whether the "whole" is a family, an organization or a community, it is tremendously difficult to truly grasp it. "If only our company knew what we knew," said one CEO, who was lamenting his organization's efficient information flow. What stopped them from "knowing what they know" was the inability of the entire organization to be aware of the whole.

I recently consulted with an organization that consists of Americans and Israelis, both Palestinians and Jews, and in my interviews with them I consistently heard the same refrain:

- "No body seems to get the whole picture."
- "They see only their part, not the whole organization."
- "We are suffering from myopia… we can't see past our noses."
- "Isn't there some way we can all get on the same page?"

The bad news was: they were all seeing the same organization through different lenses. But the good news was: they knew it. Even though they were not succeeding at "seeing from the whole," [4] at least they were committed to trying.

Integrity, the intention to identify with the whole, does not mean that we have to blur the distinctions between the parts. On the contrary, it means learning to see them more clearly, or more "holistically."

---

[4] Peter Senge, Joseph Jaworski, C.Otto Scharmer, Betty Sue Flowers, *Presence: Human Purpose and the Field of the Future* (New York: 2004), Chapter 3.

"Wait a minute!" someone shouted at me, in one of my recent workshops. "In a world where someone who hates me can blow me and my family up at any moment, when 'smart bombs' or 'suicide bombers' can attack without warning, how do you expect me to identify with the whole? There's 'us' and there's 'them.' Doesn't my survival and my safety depend on knowing the difference?"

Of course the answer is yes. But *knowing* the difference and *identifying* with the difference are two different things. The more we identify with the part, the less clearly we will see the whole. We are safer if we know our "enemies" very well. And knowing them very well requires that we learn to see them clearly, not through the distortions of our partisan lens.

Integrity grows out of the humbling realization that there are many ways of seeing the world, and that we cannot take our worldviews for granted. Doing so blinds us to the possibility that our worldviews may be incomplete, skewed or—to oversimplify—"wrong." If this is so, then no matter how noble our intentions may be ("freeing the people," "creating jobs," "protecting human rights," etc.), everything we do will backfire.

The challenge of developing this kind of integrity is captured beautifully by a 10-year-old who, one week after the attacks on the World Trade Center, wrote the following:

> Last Monday it was easy to be open-minded. All we had to do was listen to other people's ideas at recess. But this Monday, we all wonder, can we be open-minded? Can we comprehend, listen to, and reflect on all sides of the story? And more than that, can we understand the conflict and what got us to where we are now?[5]

While many North Americans and Europeans contracted in fear, others, like this 5th grade student, reminded themselves to open their hearts. They recommitted themselves to the path of seeing the whole—of integrity.

To practice integrity, we must ask ourselves three questions:

- How I am connected to the world outside the borders that define "us?"
- How does what we call "us" and "them" fit together into a larger whole?
- How can I become more aware of "the whole thing?"

When we ask these questions, and live the answers, we are practicing integrity. We are developing integral vision. And, I believe, we are making a modest but significant contribution to peace and justice on this small and precious planet.

Mark Gerzon *is president of Mediators Foundation and co-director of the Global Leadership Network, a global collaborative designed to develop global thinking and practice among emerging leaders in both private and public sectors. He is the author of several books, most recently* Leading Through Conflict: How Successful Leaders Transform Differences Into Opportunities (Harvard Business School Press).

The Springs of Leadership

Nathan Harter

Abstract: Leadership denotes activity, if not strenuous activity. Yet in its own way contemplation is an activity—an activity arguably at the root of leadership, which this meditation seeks to justify.

Keywords: Activity, contemplation/meditation, *ensimismamiento,* leadership, nature.

I

In the season of dogwood, I drag out the pieces of an old father's day gift—a hammock—so I can read outdoors, reclining. I find it easy on my back and, after so many weeks of winter, easier on my spirits. There I take up books on leadership, books of theory and of philosophy. Soon I stop reading, lost in my own reflections and staring up through the boughs of the flowering tree, falling asleep, as my thoughts become increasingly irresponsible, deranged. Study becomes meditation, mediation becomes a nap.

The literature on leadership emphasizes striving, the pursuit of goals, the accomplishment of tasks. Leaders constantly do things. If they are not task oriented, then they are relationship oriented, but leaders are always oriented outward, representative of purpose. They communicate a vision. They resolve conflict. They transact and transform. They are symbols of what yet needs to be done. In a manner of speaking, leaders are especially future oriented, warning about threats and promising hope.

Leaders can be imagined as that vital impulse, whatever it is, the inner drive that characterizes life. Just as the dogwood competes for water and light, striving, so also groups and teams compete for bigger budgets and status. The metaphor is never far from the surface: images of natural selection, the survival of the fittest, and nature red in tooth and claw. The philosophers Arthur Schopenhauer and Friedrich Nietzsche both tried to penetrate the commotion of life. What force or power lay behind it? The Greek called it entelechy. The Christian called it providence. These Germans decided to call it "will"—a single abstract relentless tendency in living things to survive, thrive, and persist. The struggle to exist pits organisms against each other. Selfish genes make adaptations, cooperating where they might, competing where they must.

Plant life low to the ground finds itself in shadow to the leaves of taller plants, which in forest competition grow taller still and spread their sun-catching leaves. Lower plants must flourish where trees cannot grow, or they must live in the shade, or live off of the dominant trees as vines, even perhaps slowly creeping and swallowing the trees, like kudzu taking back the sunlight, forcing the trees to hold them up, reversing the hierarchy. In his book *The Accursed Share*, Georges Bataille describes the restlessness in nature to absorb energy and protect itself, even prolong itself, to the point that life completely detaches itself from the dirt and moves. You and I are evidence of that!

SOME RIGHTS RESERVED

The most obvious use of these metaphors from nature exists in business, where doctrines of capitalism emphasize growth, competition, adaptation, uncertainty, and self-interest. Firms "capitalize" on the individual strivings of employees, channeling their natural proclivities into a corporate body with a single, abstract mission: to garner profit. Firms compete with other firms. Management negotiates with labor. Industries lobby governments. From the springs of appetite, we seem to have built an enormous autopoietic system devoted to everlasting change in a process of renewal. And the vital impulse in these various operations is the leader.

At the heart of nearly any definition of leadership is change. Leaders bring about change. Change is ascribed to them. They are the change agents, the ones who stimulate, direct, and sustain energy. They keep our human systems whirling. They feed progress.

Other sectors regard leadership in much the same way. In the military, of course, leaders orient themselves to conflict, to withstanding the onslaught and to conquest. That crafty Florentine, Niccolò Machiavelli, advised generals and politicians always to study war, especially in times of peace. One must never rest. It is no coincidence that in addition to his political handbook titled *The Prince*, Machiavelli wrote *The Art of War*. Today, politicians prefer to be seen as strong, allied with the military, war-time leaders, commanders in chief, hawkish—patriotic most in seasons of struggle. It helps when they can cite previous military service. Politicians will even borrow militaristic imagery to wage wars on poverty and combat illegal drugs. Few candidates promise to do nothing while in office. They promise to fight for their constituents.

Leadership exists for the sake of activity.

What then am I doing lying on a hammock, face to the sun, watching the layers of dogwood bob and weave? This is most passive, the antithesis of leadership. Somebody probably ought to rouse me to exertion. What good am I, suspended from a rope, swaying in the breeze? The book face down on my chest is likely to be about leadership, since that is what I teach. Catching up on my reading is the laziest of races. How can one catch up while lying down? But I am not even reading now. I am gazing at the underside of leaves, the flecks of blossoms, and the gaps of sky between them. I am absorbed in the texture, somewhere between thought and dreaming.

It occurs to me, this too is nature. Life is not all "eat or be eaten." Maybe I was laboring under an illusion, the pace of nature's conflicts being imperceptible. Trees do not grow abruptly. They stretch slowly. Their roots wriggle over time. Their girth expands in small rings. Their lives are measured in decades. To the naked eye, nothing of the tension is apparent. It all seems so tranquil. A cardinal calls from the rooftop. Bees hover. Grasses bask and bend. Maybe images of struggle overstate the case. Even in the motion I do detect, there is more of the dance than of domination.

When artists approach nature's beauty, they often respond to its momentary order, its balance. They usually celebrate what is, rather than what is passing away into corruption or pushing out of concealment. There is something thrilling in the whale that arcs out of the water. It rises from the sea and massively thrashes back into the sea, but for an instant in the air it instills awe.

Maybe the beauty derives from our awareness as observers that such moments are transitory. Maybe we celebrate the experience knowing how brief it is. We are already nostalgic for it, rather like touching the face of a child or lifting a peony. This too shall pass. Nature grinds and shivers and bores and splits, but in that wild flux—and we soon learn, because of that wild flux—there is a beautiful thing. Call it what you will, the impulse of vitality has yielded remarkable diversity and treasures.

I do not think that spiders admire the orchid. Orchids do not admire the spider's web. Nature is busy. So far as we can tell, only human beings notice and value the incredible display. It is within our powers and apparently our powers alone to admire. And a part of our appreciation originates in our longing that it stay. We hate to see the fish swim away into deeper waters. We regret the collapse of our favorite redbud tree. We spend weeks each spring waiting impatiently for the crocus. We schedule vacations in the autumn in order to drive through the wooded hills, so we can experience the colors and the damp smells. We stand perpetually on tiptoe, even straining our necks at the office to look at the weather outside. Is it a sunny day? Human beings regard it as our unique privilege to notice nature as something of a pageant. We are its audience.

So, in my hammock, attuned to my garden and gate, I serve this purpose. I am being distinctly human. Part of me is, anyway. Part of me is yielding to my own natural rhythms, alleviating my aching back and falling asleep; perfectly natural. In fact, I am between being part of nature, on the one hand, and experiencing nature, on the other hand—both within the environment and separated in my consciousness from it. I am both participant and observer. I am suspended in a tension, just as my body is suspended by the tensions in the rope.

I like the feeling. I enjoy the perspective. Where then in leadership studies, with all of the havoc and hubbub, do we find ourselves in that state, suspended and appreciative, fleetingly grateful, largely passive? As students of leadership, we can read stories about leaders, biographies and case studies. In that sense, we are not far removed from hero-worship…oh, maybe more realistic, even skeptical, assured of keeping things in perspective. But we still talk endlessly about exemplars, citing the same paragons: Gandhi, Mother Teresa, MLK.

That alone is an indulgence. If all we do is read their narratives and thrill at their heroism, then how is that different from spending an afternoon reading dime novels or watching adventure flicks? We are being entertained. We are witnessing leadership as something exterior, part of an exterior reality. That is different from what I have been trying to describe, an interior reality. As I laze on my hammock, I am not just being entertained by nature. I am experiencing it differently, deeply.

The philosopher Ken Wilber would refer to it as the translogical eye of contemplation.

Meditation is assisted by nature. It includes me serving as a witness to what nature has wrought. It also includes pondering my place in the flux. It includes using the imagination. It is more active than it seems from the sidewalk. Neighbors probably wonder when I actually work. But done properly, freely, meditation of this sort draws so many thoughts and ideas and memories together into new and creative combinations that some of my most satisfying and productive breakthroughs have originated in the twilight of consciousness, after reading a powerful passage and then halting long enough to consider it.

In a sense, I am very much like the dogwood, seemingly languid on a spring day while working beneath the surface, imperceptibly, strengthening my grip on the soil.

II

Leadership denotes activity. Unlike nature, however, leadership derives from choices that people make. Whatever role there might be for impulse, instinct, appetite, desire, and habit, at least one part of leadership includes choosing to do one thing, rather than another. Somewhere in the process, a participant exercises freedom.

When a person in position of authority carries out the commands of superiors, without initiative, without making any unique contribution, we would be hard pressed to say that he or she is leading in any meaningful sense. That person is an extension of somebody else's will, an instrument, a tool, a flunky. We expect for leadership to contain a spark of individual creativity. A leader brings something to the table. Where does that spark come from? In the relentless pace of human organization, when does the leader interject that contribution?

Warren Bennis, writing *On Becoming a Leader* in 1989, made an interesting observation. "The importance of reflecting on experience, the idea that reflecting leads to understanding, came up again and again in my conversations with leaders." Leaders periodically withdraw, even if only to take a deep breath and really think about a problem. They emerge from such moments resolved. Something happens in the stillness. José Ortega y Gasset called it *ensimismamiento*, a phase of disengagement, solitude—not to escape life's predicament, but to ponder it in peace. In short, leaders meditate. It can happen quickly. Or it can take a year-long sabbatical. In any case, it seems to be an integral part of forming purpose. Call it a retreat, call it visioning, call it prayer, call it recharging your batteries. For busy leaders, it is the pause that refreshes.

Life has a way of scurrying ahead. Work expands to fill the available time. There is always more to do. "What have you done for me lately?" Customers expect results. Supervisors need quantifiable measures, deliverables. A really talented leader is in demand.

I never get tired of the story of an efficiency expert who told the manager to fire that guy in the corner office who never seems to be doing anything. He sits all day staring out of the window with his feet up on the desk. "I seem to recall," replied the manager, "that he was sitting just that way when he came up with an idea to save this firm a quarter million dollars. He stays."

Without *ensimismamiento*, leadership can be reduced to technique, schedules of reinforcement, manipulation, the causal relation between something the leader says or does and something the follower does in response. Leadership is a collision of human particles, reduced to mathematical formula, like fluid dynamics. One can turn then to the science of leadership. What makes leadership uniquely human, however, and more of an art, is the experience equivalent to what I enjoy lying on my hammock. I get to suspend overt activity and become quiet.

Meditation has its risks. A person might come away with nothing. There are no guarantees that it will produce. It is, if anything, a letting go of such expectations. At such times, one is living, in the memorable words of Hannah Arendt, without banisters. Meditation can also veer a person away to other things, to distractions, even to sleep, where deeper powers of the psyche cavort. That is not an altogether bad thing. Worse, meditation might impress upon a person some new idea—an innovation, reform, repentance—conscripting the conscious leader to take up a new burden, a challenge. Meditation just might demand exertion. The risk is that meditation issues in a call for leadership.

Be careful what you wish for. You just might get it.

We have little reason to believe that the rest of nature experiences purpose. The more mechanistic models of nature say that organisms have their functions within a system, and that's just about it. There is no doubt, on the other hand, that human beings do experience purpose. And it is my job as a teacher to emphasize the value of these experiences and to give my students opportunities to have these experiences, to knock the chocks away from the wheel, to disengage the clutch, to drift in a state of wonder and doubt. Students learn to right themselves. First, I want them to submit themselves, subject themselves to these disorienting experiences, inasmuch as education consists in a series of such experiments.

Happily, our very human capacity to gaze on nature, to watch it without asking anything more from it, assists in the process of meditation. It is a meditation to see it snowing outside or to stop and smell the roses. Nature invites us to come away and lose ourselves in its texture and depth.

Nature draws us away from struggle and routine. Where else do we go when we stare into a roaring fire or gaze at a rippling stream? We turn from Doing to Being and then return to Doing more richly, or at least refreshed.

It is my contention that leadership as such originates in solitude, private unstructured reverie, even dreams.

III

The Christian tradition depicts at least three women named Mary. Mary, the mother of Jesus Bar-Joseph, observed her remarkable young son and pondered these things in her heart. Mary, the sister of Martha, attended Jesus as a houseguest, not by scurrying about the house getting things in order, but rather by sitting and listening to him. Mary Magdalene in the garden, after searching in vain for the corpse of Jesus, stood outside the empty tomb weeping. Moments of passivity, yet moments of drama. Perhaps unlike the quarrelsome men in his entourage, they had chosen the better part.

We are each of us suspended in the world. Occasionally, we ought to slide the book down, remove the pen, cock our head to one side, and take our thoughts into the wilderness of a hundred rustling dogwood blossoms, for a kind of alchemy where troubles turn to gold and we find purpose sufficient for the day.

I want my leaders to use a hammock.

Nathan Harter *left the practice of law in 1989 to become a college professor at Purdue University, where he teaches organizational leadership. In 1995, he was promoted and tenured in the School of Technology for his work in southeastern Indiana. His first book on leadership theory is being published by the Purdue University Press. The father's day hammock was given to him by his children, Nathan, Elijah, and Kalyani, with some assistance from his wife, Karin.*

Passionate Winking

Sayyed Mohsen Fatemi

Discombobulated and deluded in the chamber of inductive and deductive imagination,[1] a moment of illuminative philosophical reflection passionately winked at me bringing an intuition.

My cerebral cortex and my limbic system marshaled their desire and ebullience right in front of the window of intentionality[2] way beyond Husserl's conception of consciousness.

The excitement phase[3] of intriqueness honked the horn of engrossment for the urge to consummation.

---

[1] Inductive and deductive arguments refer to two different processes of reasoning. In induction, the reasoning is done from particular to the general. Although the conclusion is supported by the premises in induction, it does not necessarily follow from the premises and its truth is not guaranteed by them. In deduction, a conclusion follows necessarily from the premises. There are minor and major premises in deductive argument and the conclusion is born out of these two premises. Here these processes are linked to imagination so imagination is broadly used here as a 'noun' (linguistically speaking) for the adjectives inductive and deductive. This also opens up a new discussion on the relationship between reasoning and imagination.

[2] Husserl (1965) made this concept famous. Before him, his teacher, Franz Brentano used the concept and he borrowed the term from some medieval philosophers (McAlister, 1976). In phenomenology, intentionality refers to the thesis that every conscious act has an object. The act is called 'intentional act' and the object 'intentional object.' The term gains its significance because it undercuts the metaphor of mental 'contents' (as in a theater, an image explicitly used by David Hume (2003), for example). Therefore, conscious acts are not self-contained contents that are unknowingly coordinated with the movements of our bodies. Intentional conscious acts are among various acts. Here, the concept is pinpointed, yet it is distinguished from the one used by Husserl.

[3] This is a term used by William Masters and Virginia Johnson (1966, 1961) who studied human sexual response and used the laboratory setting to learn about physiological changes during sexual arousal (see Crooks & Baur (1999) for a discussion). Excitement phase refers to the first phase of the sexual response cycle, in which engorgement of sexual organs and increases in muscle tension, heart rate, and blood pressure occur. This is used here analogically to indicate the commencement of the act. Notice the word 'consummation' right afterward and its implications of fulfillment, completion, and achievement. So the language of sexuality is associated with the language of philosophy.

SOME RIGHTS RESERVED

The lips of my curiosity pressed the thighs of sagacity away from Strawson's[4] conceptual analysis and Quine's denial of Kant's synthesis.[5]

The kiss of perspicacity smacked so vociferously that it brought the sex flush of my privileged access[6] in the plateau of abundance. The heart rate of my sensation became united with the palpitation of my understanding. They both exceeded transcendental hermeneutics and warmly embraced the Heideggerian one.[7]

---

[4] Peter Freerick Strawson called his metaphysics 'descriptive.' He insisted on indicating that it was only to be construed as an analysis and description of our conceptual framework and not of reality-in-itself. He introduced systematic metaphysics into current British philosophy through his book *Individuals* (1959) where he argues that only after the recognition of the primary category of 'persons,' we can consider the distinction between mind and body. Persons are not conglomerates of minds and bodies, and we can talk of minds and bodies only because we first have a way of specifying the different attributes of a person. The reference is made here to a form of sagacity whose analysis can not even be done by Strawson's conceptual framework.

[5] The reference is made here to Quine's (1960) attack on Kant's (1998) distinction between 'analytic' and 'synthetic' sentences. According to Quine, there are no indubitably 'necessary' statements or beliefs, just those that happen, at a particular point in our knowledge and interests, to hold a relatively protected place in the overall system of our beliefs for ostensibly practical reasons (see Miller (1998) for a discussion).

[6] A term used by philosophers to refer to the point that only a person knows directly what is in his/her mind without having to observe his/her behavior. This is also indicative of the point that mind has a unique characteristic in that one and only one person can and must experience what is going on. Here this has been preceded by the introduction of sex flush, a term from the psychology of sexuality which refers to a pink or red rash that appears on the chests or breasts during sexual arousal. So the sex flush has been used metaphorically and analogically to serve as a preamble for the introduction of the concept of privileged access as if privileged access sprung from somewhere. The plateau of abundance pinpoints the opulence and profusion of the privileged access and its happening. The plateau is also a term used by Masters and Johnson (already explained) for the second phase of the sexual response cycle, in which muscle tension, heart rate, blood pressure, and vasocongestion increase.

[7] In his book, *Being and Time* (1962), Heidegger suggested that life is like a text, and the purpose of our lives is to understand that text. He tries to 'uncover' the hidden meanings in our experience in his hermeneutical phenomenology. He rejects the scientific tone of Husserl's phenomenology and prefers to talk about the structures of life itself, including our profound sense of history, which defines human life. Heidegger was a student of Husserl. And therefore a phenomenologist. Phenomenology refers to the study of human consciousness. The use of the word 'transcendental' in Husserl and also Kant means the basic and the only rules with which we 'constitute' our world. Husserl attacked all forms of relativism and tried to develop a transcendental hermeneutics that discovers the basic rules of all experience (see Bauman (1978) for a discussion).

The rapture of the intelligibility cuddled the velvet of joy apart from the every day discourse.

The yearning for embracing the reality bloomed in the havoc of Hume's exegesis[8] and I felt ascended towards the plains of epistemology.[9]

Was this intuition, inspiration, reason, senses, or experience? Maybe none, maybe all. Maybe it was ineffable. But it is incorrigible.[10]

The blooms of my contemplation had their ornate intercourse with the sunlight of enrichment.

The refraction period was quick. No resolution phases[11] whatsoever.

I could see the incessantly smothering kisses of mystical insights coil around my consciousness, of course not in a Freudian sense.[12]

---

[8] I use this here as a critique of David Hume's (2003) thesis that there is no knowledge of right and wrong and no rational defense of moral principles. These are based on sentiments or feeling and, as such, can not be defended by argument.

[9] The study of human knowledge, its nature, its sources, its justification.

[10] Philosophical term which refers to the point that we can not be mistaken about our mental states. There is a distinction between privileged access and the incorrigibility. The first means that the person knows what is in his/her mind without having to observe his/her behavior; the second means that he/she knows for certain and beyond the possibility of error. This is used here as an indication of a thing that can not be mistaken.

[11] Refractory period happens in the male after orgasm during which he can not experience another orgasm. The resolution phase of the sexual response cycle as outlined by Masters and Johnson is the fourth phase in which the sexual systems return to their non excited state. This is used here to metaphorically discuss the continuous process of an intelligible ecstasy versus a temporal enjoyment such as that of a sexual one.

[12] Freudian taxonomy of consciousness, pre consciousness and unconsciousness does not have any room for the placement of mystical experiences as discussed in there. Superficially, it might be subsumed under one division of his category related to sublimation. However, this is epistemologically unknown to Freud and his classification of the consciousness. (See Ha'iri (1992) for a discussion of the arguments of the existence of such consciousness).

Avenues of Mysticism

Sayyed Mohsen Fatemi

I walked through the avenues of mysticism amidst the dark nights of despondency when the nightmares of failure, fiasco, annihilation, devastation, and delirium ferociously echoed in the dismal channels of desperation and frustration, when the fulcrum of being was paralyzed by the antagonizing impediments and the havoc of the mansion of life.

I walked through the avenues of mysticism and searched for the houses of peace where the erosion of anxiety and the mirages of certainty pine away.

I saw a man who was selling pomegranates of joy to the hearts of people at the cost of a sincere smile quite different form the ostentatiously hypocritical ones that can often be found in the metropolitan cities.

I saw a woman who was giving away cascades of lilacs and baskets of sweet basil munificently and generously to open up the incarcerated hearts.

I saw gazelles of sensibility running free in the realms of tigers.

In avenues of mysticism, jasmines teach eloquence and water lilies offer philosophy, the chosen would walk on water and the elite would break the moon and exceed the sun.

In avenues of mysticism, people share the nakedness of the heart and never get lost in the alleys of alienation. There is not a dead end, or a shut off. Nor any cul-de-sac or impasse.

In avenues of mysticism, people use the express train of bliss and bring the news of awareness without any need to C.N.N. or A.B.C. or C.B.S. In avenues of mysticism, the petals of the flowers act as correspondents and report the latest happenings not in utilitarian ways.

In the avenues of mysticism, the subordinate clause sits by the main clause without any shame or doubt. Even the compound sentences turn out to be prepositions afterward.

In avenues of mysticism, prayer serves as a panacea far better than any amphetamine, barbiturates, and PCP or thrill pills.

A Transdisciplinary Mind: An Interview with Ian Mitroff

By Russ Volckmann

Abstract: Known more widely as the “Father of Crisis Management,” University of Southern California professor Ian Mitroff came to the work of Ken Wilber and integral theory over two decades ago. No one else has brought an integral perspective to the fields of management and organization theory for as long as Mitroff. In this interview he talks about the development of his theories, the people he has worked closely with, his spiritual development and the streams of his work, including his research on spirituality in organizations. While his involvement with Wilber’s Integral Institute is not what he would like it to be, he sees there the potential to develop an institution that addresses the politicization and failures of our institutions of higher education. In the face of the crisis in leadership, integral and transdisciplinary approaches have the potential for making a positive difference as we are faced with the dissolution of distinctions that underlie how we make meaning in the world.

Keywords: crisis, integral, leadership, psychology, spirituality, systems, transdisciplinary

Introduction

One of the striking aspects of Ian Mitroff’s work is his ability to engage phenomena through a variety of lenses. There are several ways to approach the study and development of complex issues and systems. We can look at them through the lens of a particular discipline, e.g., physics, biology, sociology, or philosophy. We can take an interdisciplinary approach that brings together the views of several disciplines at the same time, e.g., what does change look like through the perspectives developed by various disciplines. We can take a multidisciplinary approach whereby representatives of various disciplines try to find common ground on a subject. Finally, we can take a transdisciplinary approach. According to Nicolescu (Manifesto of Transdisciplinarity, 2002)

> *…transdisciplinarity concerns the dynamics engendered by the action of several levels of Reality at once. The discovery of these dynamics necessarily passes through disciplinary knowledge. While not a new discipline or a new superdiscipline, Transdisciplinarity is nourished by disciplinary research; in turn, disciplinary research is clarified by transdisciplinary knowledge in a new and fertile way. In a sense, disciplinary and transdisciplinary research are not antagonistic but complementary. (45)*

As I will show, and as the interview bears out, such an approach is very much in the spirit of, if not identical with, that taken by Ian Mitroff in his work.

SOME RIGHTS RESERVED

I wanted to interview Ian Mitroff because of the many facets of his work related to organization change and development, managing and leading in the face of complexity, working and thinking in organizations, all subjects that have been important in my own career. Over the years I have found in his contributions insights that many of us continue to struggle to define and consider in our work. An example of this is how to bring together the internal, external, individual and collective considerations of Ken Wilber's work in the study of phenomena and in building approaches for change and development individually and in organizations and communities. While the depth of Ian's work cannot be represented in one short interview such as this, I believe we have here a useful overview upon which to build. And I hope to have the opportunity to do so in the future.

It is probably coincidental that Ian Mitroff and I spent some of the same years at Berkeley—during the 1960s. We both graduated from college in 1961, he at the University of California at Berkeley and I at Monmouth College (now University) in New Jersey. We both began our Masters programs at Berkeley in 1961, he in Engineering and I in Political Science. He completed his Ph.D. in 1967, thus demonstrating a high level of focus and commitment, while I dragged out those luxuriously political and social student years and the agony of writing my dissertation until 1974. While Ian was on the faculty at the University of Pittsburgh (Pennsylvania) and building a strong academic career, including collaborations with a number of very talented original thinkers in their fields, I taught at the University of Arizona and got enmeshed in the human potential movement of gestalt, neoReichian, transactional and various other therapeutic modalities. Ian went on to a long and continuing career at USC where he has been active, not only as an academic, but in applying his work to the real world of corporations and government. Ian's list of publications is quite extraordinary. I dropped out of an academic career gradually, went back to school for a program in humanistic psychology in order to work with change and development in government and business organizations and limited my publishing to pieces in small periodicals oriented to change agents.

The parallels and differences in our careers are significant. Ian offers a transdisciplinary perspective to work those impacts throughout the United States and the world. My own efforts have been somewhat transdisciplinary—and even more so in the last ten years. What I find in Ian's work is an early focus with a transdisciplinary perspective that has been influenced to an important degree by the work of Ken Wilber. I came late to Ken Wilber. Ian has taken to heart the integral approach of Ken Wilber and applied it to his own life on many levels. This is not to say that Wilber is his only influence, but that it has been an important one that I suspect Ian has applied even more to his own life than solely to intellectual pursuits. In the latter it shows up in his transdisciplinary perspective and some use of the four quadrant model as a lens on the things that have interested him.

In 1983 Ian wrote: "Ken Wilber is a young scholar of immense potential. He has already produced a highly significant set of books that explore the notion of mind across both Western and Eastern viewpoints." (Stakeholders of the Organization Mind). In fact, Ian has expressed his respect for Wilber's work more consistently and longer than any other academic I have discovered.

In addition to Wilber, he has cited such significant influences as West Churchman (Systems Theory), Russ Ackoff (Systems Theory), Bruno Bettleheim (Psychotherapy), Norman O. Brown (Philosophy), Joseph Campbell (Mythology and Comparative Religion), Sigmund Freud (Psychoanalysis), William James (Psychology and Philosophy), James Hillman (Archetypal Psychology), Carl Jung (Archetypal Psychology), Herbert Marcuse (Philosophy), Erich

Neumann (Archetypal Psychology), and Marie-Louise von Franz (Archetypal Psychology). The range is wide and exciting. Another area he and I have in common is our interest in Hillman, von Franz and Jung. In the early 1980s he was using their work in his writing and his work with clients. This interest in archetypal psychology and Jungian personality theory was something I shared and used, as well, during that same period, including the publication of an article on Jungian archetypes and organization change. And while his work seems to have focused on individuals and large (corporate) systems, I was working with individuals in smaller organizations, most often at the team or project level.

Since completing his Ph.D., his work has focused on crisis management. In fact, he has been called the "Father of Crisis Management." Yet the concept of crisis management seems too narrow to capture how he has integrated thinking from systems theory, psychology, philosophy, organization theory, leadership and a number of other disciplines. The titles of his books suggest the scope of his work. Here are some examples of his books that suggest the range of his attention:

The Subjective Side of Science, 1974
Stakeholders of the Organization Mind, 1983
Business Not as Usual, 1987
Break-Away Thinking, 1988
We're So Big and Powerful Nothing Bad Can Happen To Us, 1990
Framebreak, 1994
The Unbounded Mind, 1995
The Essential Guide to Managing Corporate Crises, 1996
Smart Thinking for Crazy Times, 1998
A Spiritual Audit of Corporate America, 2000
Managing Crises Before They Happen, 2000
Crisis Leadership, 2004
Why Some Companies Emerge Stronger and Better from a Crisis, 2005

Ian Mitroff has had the career my mother would have wished for me. In this conversation, with a bow to Frank Visser who wrote so well about Ken Wilber's intellectual career using a stage approach (Ken Wilber: Thought as Passion, 2003, Albany: State University of New York Press.), I have tried to put Ian's transdisciplinary career in perspective.

Russ Volckmann

Intellectual Foundations

Q: You have an unusual career path. You began in engineering and moved from there to become a professor in USC's highly respected business school, the father of crisis management and an organization theorist concerned with the inter-dynamics of individuals and their relationships with the systems where they work. You added to that a focus on spirituality in corporate America. Your work includes organizational systems, Jungian archetype psychology and personality theory, the four-quadrant model of Ken Wilber, ways to challenge assumptions and a whole lot more. Then there are your *frequent op ed pieces in newspapers where you critique politicians and policy. If nothing else, this suggests that you're having a very full life.*

Perhaps we could use an exploration of the phases in your career and the major intellectual layers that you chose. In the spirit of Frank Visser, we could begin with Mitroff I. That was your post sputnik era interest in engineering. At Berkeley you majored in engineering physics as an undergraduate and also obtained an M.S. in structural engineering. Your Ph.D. at Berkeley involved a shift to engineering psychology with a minor in the Philosophy of Social Sciences. You did a dissertation about a computer simulation of human decision-making. Here you seemed to be exploring what became the title of one of your books, The Subjective Side of Science. *What were the important intellectual aspects of your work during this period?*

A: I have to back up and give a little bit more background. I essentially went into engineering because growing up I was good in math and science and for a poor kid, the first one in my family ever to have gone to a university, I literally did not know what other careers there were where one could make a good living. It was only when I got to the university that I really learned that there were all these other worlds and interests.

In high school I liked everything. It wasn't just math and science, but I liked literature, you name it. When I got to the university, I didn't think much about it because I really didn't know that universities are like most institutions: they are really not well-rounded places. They force you in many ways to choose a single discipline.

First of all, universities are organized around disciplines, which is an antiquated if not counterproductive way of organizing knowledge. Most academics really have never thought that the disciplines are just one way of organizing knowledge. That's all they are. They take them as basic elements that have descended from the heavens. But they are only political units that are there to meet basic psychological safety reasons. Most people need the certainty and security they provide.

I remember when I was a sophomore-engineering student and we were required to take a one-year course in social sciences; we had some fascinating lecturers. One was Louis Feuer. It was the first time I was ever exposed to Marx and to Freud. I remember the day in this big lecture hall of 200 people that we were talking about Freud. I had never even heard of Freud. We were reading Freud's introductory lectures to psychoanalyses on dreams. I found it utterly fascinating. But when I looked around the room, I saw disinterest at best and more often than not, sheer disgust. The reason for the disgust among my fellow engineering students was their attitude, "What the hell did this have to do with engineering!" It was nonsense to them since you couldn't put it in a formula. I found that attitude so abhorrent to me that that was really the beginning of my eventual departure from engineering.

I got a Ph.D. with a three and a half year minor in the philosophy of social science from West Churchman. West was in a business school of all places, because although he was a philosopher he wanted to teach philosophy to applied social scientists. My minor became my real major. However, I'm glad that I actually did go all the way through engineering, because I have a quantitative structured side. But without philosophy, I wouldn't be able to do things such as crisis management or most things, which are not only inter- but also transdisciplinary.

I not only don't believe in the disciplines, but I am an enemy of them because again, it is just one way to organize knowledge. Increasingly, it's a highly dysfunctional way. It's no accident why interdisciplinary efforts are extremely hard to get going in universities. It's no accident that people like Ken Wilber wouldn't find a home in a conventional university within a single department. That's a real tragedy.

That is the background and the reason why I finally ended up taking the three and a half year minor in philosophy of social science—which by the way, the U.C. Berkeley College of Engineering did everything in its power to talk me out of and put up hurdles, because they didn't understand what the hell did that have to do with engineering. I tried to explain to them what I was doing. For some reason or other as a young kid—even in my mid 20's getting a Ph.D.—it hit me that philosophy was the most general of all things to study and I just kept it going. That was probably just as well that I didn't go to a philosophy department because that would have been just as disciplinary and killed off the search for general knowledge. That's a brief summary of my background.

Q: *You make it very clear that being a scholar in a university is a real challenge.*

A: Yes, but it's more than that. First of all, most people in universities are not really scholars. I consider myself more of an intellectual because of all the reasons I just listed. I do have disciplinary training and I have widely studied the disciplines. But they are artifacts. Most people think of them as real things. They're not. They are artifacts. But secondly, a very narrow interpretation of scholarship takes place in universities that is not for a broader public or for the problems of the world. It's mainly for other members of the narrow community. Frankly, I'm not interested in that and it turns me off. It's for the same reason that I'm not a member of any organized religion. It's just too narrow for what I am.

Q: *You mentioned your work with West Churchman. What was it about his work that you found was inspiring?*

A: A number of things, although I didn't know it at the time. Churchman was one of the few people at Berkeley—he obviously had an enormous intellect—who had a real systemic view of human knowledge. He was one of the developers of the systems approach. I've talked to Ken Wilber about this. Ken doesn't really mention Russ Ackoff and West Churchman as developers of the systems approach. I do think that Ken's notion of systems is even broader for the reason that it includes spirituality. Churchman didn't get that part until later in life when he was confronting his own demons, largely around alcoholism through AA. But it's kind of strange since his mentor, E.A. Singer, Jr., was one of William James' best students. If James were alive today, he and Ken Wilber would have a powerhouse relationship. I have no doubt about that. They would be talking with each other and interested in one another.

Churchman was one of the most powerful intellects on the Berkeley campus. At Berkeley you had all of these Nobel Prize winners and top professors running around, but West was truly different than all of them. He was deeper. He was very smart and, in addition, he was wise. He just attracted students. He was a magnet. He was a magnet for all the students like me who had been hurt by all these disciplines.

The disciplines are like Chinese foot binding. They attempt to bind the mind. They are almost like cults. If you look at what goes on in Ph.D. education, a lot of it I just call sheer indoctrination. And too much of it is fear based.

You come out of most Ph.D. programs terribly afraid to do anything out of the mainstream. That's important when we talk about what I did in spirituality or crisis management. Most people, whether they are tenured or not—in fact they are tenured—would not do certain studies because they are horrendously afraid of what the rest of the profession would think of them. They are terrified. So the built-in censorship is incredible. We talk about authoritarian regimes around the world and authoritarian organizations. One of the biggest is the contemporary university. I will say it and I won't make friends. I think most academics are like sheep and they're not really independent. Even though they supposedly have the luxury of academic freedom, they are afraid to use it.

Q: *I'm sharply aware that I laid out my plan for this interview in somewhat of a linear fashion and having read as much of your work as I have, I should have known better.*

A: Well, would you have a linear interview with Ken Wilber?

Q: *Right, exactly.*

A: Everything is related to everything else, it doesn't matter where you start or end.

A Whole Systems View

Q: *This formative phase of your work when you were opening up to all of these new disciplines and perspectives seemed to transition as you moved into academia and began publishing. Your focus became a deeper question of the relationship between the workings of the human mind and emotions and scientific and technological innovation and creativity. I wonder if this is Mitroff II, because this is a time when you seem to be saying things that people are still struggling to express in the literature today. Here you seem to take an organic systems view of organizations and roles, whether they are internal or external, that are played out in these systems. It's here that you advocate for nonlinearity and a transdisciplinary theory of inquiry.*

A: I wouldn't necessarily call it Mitroff I or II. It may be a sense of maturity or just reading more and deepening my understanding of concepts or my appreciation of them. I think that was always there, at least in my mind it was. It wasn't necessarily always expressed because things unfold, but all that stuff was back in my getting my Ph.D. and this three and half year seminar which met every week on the philosophy of social science.

That was not a conventional philosophy of science. We read Jung and Freud. We might have read Ken if he'd been more available. I think Ken was just starting out at that time, so he wasn't there. I, independently of my mentors, discovered Ken Wilber. One of the things—I mean everybody has strengths and weaknesses—about West Churchman's greatest strengths was that he was very intuitive. He was very smart, but he was much more of a thinking type: his dissertation was in symbolic logic. Again as I said, he was an alcoholic; he openly acknowledged he was in AA. He came to spirituality later in life, really realizing that spirituality was the most powerful force of all. But he still came to spirituality mainly through a rationalist perspective where the concept of God plays a prominent role. God is the guarantor of knowledge. But that's very abstract; that's impersonal. That's not necessarily a kind, loving God. It's certainly not a God that helps one in recovery, to manage life's problems, a giver of goodness and so forth.

Q: *In this early period of writing is where you begin to present your admiration of Wilber's work and you take what I would call a developmental perspective of human psychology and the idea of the path of transcendence. During this time, you formed professional relationships—and perhaps they went beyond that—with Ralph Kilmann and Dick Mason, who I think was at the University of Arizona. I noticed his preface to Stakeholders of the Organizational Mind was written in Tucson where I taught in the early 70's. You began to coauthor a lot of works with Mason and some with Kilmann over a number of years.*

A: I was very selective, very particular. Dick Mason was also a student of West Churchman, so we had a common vocabulary. Dick and I met when we were both at Berkeley.

When I went to the University of Pittsburgh, my first job, Ralph Kilmann came there a few years later from UCLA and he was very smart. Ralph was brilliant and we shared a lot of interest in Jung. The point is these were people with whom I could talk. One of the difficulties of going through and doing this is that you are lonely in a way. Most people are trained at best to be positivists. They learn a mixture of crude empiricism and crude rationalism, but West and Wilber are way, way beyond that. It's like saying, what's a methodology for human inquiry that's founded on an integral approach? I mean, most people aren't even aware of the question, let alone how to respond. Ralph was a kindred soul; we did a lot of pioneering work together. We wrote a lot of papers.

Q: *In this early time when you published Stakeholders of the Organizational Mind, which I think is a most extraordinary book for its time, Dick Mason wrote the preface, referenced Basho and wrote Haiku. This suggests possibly that your collaboration was more than just an intellectual relationship.*

A: It was more than that, sure. It was partly spiritual or developmental or whatever you want to call it. *Stakeholders of the Organizational Mind* was an attempt to look at the fragmentation in the social sciences and to think, rather naively, that one could heal it. It's like reading one of Ken's passages years ago—don't ask me which one, but I remember—he was naïve enough, he says this laughingly, to think that his overarching framework would be embraced by all the people he put into his framework. If anything they were hurt and insulted because every one of them wanted to think that they were the whole picture and to be relegated to a quadrant or to a particular level was not only crushing, but made them mad as hell.

Let me put it this way. Over the years, I don't know how many Ph.D. dissertation committees I've served on. Almost without exception all of my colleagues, except for maybe West, have this mantra: Take a problem that the student has, it's really not their problem, it's a problem of the discipline. Every dissertation advisor encourages the student to whittle it down, to narrow it down, to bite off a small chunk so it's do-able. ***No one asks them ever to be expansive.***

My mantra is: Take an issue or a problem and expand, expand, expand it until you reach the limits of your comfort zone, where you can no longer expand it or your intellectual powers break down. You don't know what to say; it becomes meaningless, and so on. The point is no one goes the other way. It's like Ken saying, "It's turtles all the way up and turtles all the way down." Russ Ackoff said, "If there are no limits to expansion, there is no limit to atoms." But most people don't get that and it's part of the mantra of current university positivism that one will eventually come to the atoms of human knowledge or whatever it is.

Well, those are only concepts. Most people don't understand that what they're proposing is not just an epistemic strategy, but also a psychological one. They're telling us about their comfort zone. Most people are not comfortable with wholes or holons or whatever you want to call them, but they are only comfortable with very small atoms. Why does the modern university or most organizations attract and develop a preponderance of atomists? Except for the sociology of knowledge or philosophy, at times, no one asks that question. It's just part of their background oxygen.

Q: When you were writing Stakeholders of the Organizational Mind, how would you describe the state of your own spiritual development?

A: I wouldn't say it was particularly great because I really didn't know much about it. I came at it more from philosophy. Philosophy was a substitute for me for the particular religion into which I was born, and really didn't have a lot of meaning for me. So I never called myself a religious person. I think I was on a spiritual quest without knowing it at the time. That's really what it was. To say I went to study philosophy because I felt uneducated or undeveloped is true, but I think the spiritual part of it was unknown to me at the time. I think I had some awareness that it was partly spiritual, but it certainly wasn't developed.

Father of Crisis Management

Q: Then the next phase as Mitroff III sees you for the first time being recognized publicly as a father, the Father of Crisis Management. During this period you're collaborating a lot with Ralph Kilmann, Thierry Pouchant and others. It seems like a remarkable transition, because here you're taking these larger concepts and you're beginning to apply them to what is unthinkable or unknowable. Would you comment on that?

A: That's partly true. Part of it is that I took a one-year sabbatical leave of absence from University of Pittsburgh and went to the University of Pennsylvania Wharton School where Russ Ackoff was. (Russ was one of West Churchman's first students.) While I was there, I was part of an applied research center and one of the clients we had was McNeil Pharmaceuticals, a division of Johnson & Johnson. McNeil made Tylenol and I worked with the executives there on a very interesting project around assumption analysis.

When the Tylenol poisonings occurred I was truly shocked. I was personally hurt, because I knew these executives and they were good people. This light went on in my head. I just knew instantly that something—call it crisis management, whatever—was now going to be a prominent feature of today's world. It's like once these things happen, you always have airport metal inspections. You never go back. They become marker events.

Partly I was bored. I had done *Stakeholders of the Organization Mind*. Now, what more, what new was I going to do? I was thinking of leaving academia to go into a leadership position or something. I was really bored with the academic world. Lo and behold, along comes this new thing and I realized that, oh my god, it's literally now going to be an important feature of the world. When you build a world that is so interconnected, the time of system's approach has arrived. An interconnected world is imminently susceptible to disruption.

The sad thing is when you see 9/11 and Katrina. Most of what happened in Katrina was predictable, including the poor response of the government and FEMA and all the rest of that. It shows how little learning has occurred in 20 or so years since I got into this thing. It's pitiful. We oscillate between frantic fear of being overwhelmed and then doing nothing.

You don't want to get me into what I think of the current administration: It is the worst that I have ever seen in my life.

Anyway, there is another part that also comes out of William James: the world is a laboratory. You learn by going out to the laboratory. One of the ways I learned crisis management was doing a lot of consulting. Most academics don't really understand applied research. That's how I got highly sensitive confidential data that I wouldn't have been able to get any other way—by going in and doing crisis audits and talking to hundreds of executives in all kinds of organizations.

The one area where I would critique Ken is I don't think Ken is sufficiently aware of the intricacies of organizations. I know that's not his primary concern, but I think that would give an added flavor and dimension to his work. One of the things that were very important to Churchman is implementation. For William James and West you don't just have a true proposition or assertion about the world, but you have something that is true if and only if you're able to make changes in the ethical quality of our lives. That means that ethics and implementation are integral to knowledge. It's not like most of my colleagues say, "Oh well, I have a true statement and I'll just tack ethics and implementation on at the end." Oh no, ethics is there right in the beginning, in what we call true and what properties we observe as true or characteristic of human beings.

So ethics is built right into our very theories and facts, if you want to call them that, at the very beginning. Also, you don't have a truth unless you are able to make a change in the world. What good is it to say I have a theoretical solution for how to end poverty and world hunger if I can't do anything about it? That's a partial truth at best. So the point about crisis management: it's not just going out into the world; it is not only learning from the phenomenon that is out there integral with the world, but learning how to make a difference in the quality of the world.

What is so frustrating still is that we know a lot of the reasons why crises happen and even what to do to avert or to lessen the impacts of many of them. Yet we still have all these barriers. That's why you want to say integral politics and integral this and that are so important because the main lesson—you know Ken and Albert Einstein have both said that problems cannot be solved at the level of development or the language in which they are first presented.

Q: *Or created, yes.*

A: So you have a problem like Katrina because it's the fault of a system in its lack of development; it cannot be solved at that level. That is one of the primary lessons of Katrina in applying the thinking of Ken. Katrina shows you can only solve social problems—depending on what you mean by solve—on a higher level of human and social development.

Q: *One of the people that you were actively involved with, both in the area of crisis management and later in the area of ethics is Thierry Pouchant.*

A: Thierry was a student of mine at USC. He was a very good student—very bright and a very nice person, a very good person, a good soul. Thierry and I still stay in touch.

Integral Spirit

Q: *In Mitroff IV you were active with the early years of Wilber's Integral Institute, you published The Spiritual Audit of Corporate America and you participated in the formation of the American Management Association's Management, Spirituality and Religion group*.

A: The *Spiritual Audit* represented the fact that I've been doing crisis management for all these years and, while intellectually exciting because it's so complex, it is a downer in many ways because bad things are happening. For years I've been wondering, actually angry, and asked why no one had gotten out there and done a good empirical study of spirituality in a setting where most of us spend the majority of our waking hours. I did not want to ask—as the typical studies have done—how many times a day do you pray or what the practices are? I, frankly, was bored with that. What does that tell you?

I was more interested in what **meaning** spirituality and religion had for people and how organizations could practice it without blowing up and fractionating all the employees. I was absolutely astounded that no one had done that. Finally, one day I said, okay, my energy is now there. I'm going to get out and do a series of interviews. I had a collaborator on the east coast, Elizabeth Denton, and I went out and did sixty interviews. At one point I remember talking with my good friend and colleague, Warren Bennis who said, “Come on Ian, you've done enough with twenty interviews. You know what you are going to find.” I said, “You're right Warren, but the interviews are so rewarding that I can't stop doing them.”

Q: *Speaking of those interviews, you defined what you mean by spirituality based on what you got from the interviews, what people told you spirituality was for them.*

A: Right. It was not my definition because I'm now aware that one of the first issues, spirituality, religion and Ken's work, is to have a better grasp of the multiple meanings of the definition. The reason I get defensive is that constantly I'm asked by people, "What's your definition of spirituality?" I have to correct them and say, "You know, it's not mine." What I knew instinctively is that I did not have to ask people what their definition was. You get a definition by asking people what meaning 'blank' has for them. Here's the academic mind: they first have to have a definition of what they're studying before they study it. If you had a perfect definition, for crying out loud, you wouldn't need to study it. It's just absolutely insane. But those are people who have low tolerance for ambiguity. This is not incidental.

Q: Maybe I've fallen into that trap on the subject of leadership, which I'd like to talk with you about, but I want to note the definition that emerged from your study. Spirituality was the basic desire to find the ultimate meaning and purpose in one's life and to live an integrated life. Is that a fair summary?

A: That's part of it, but the other part was this feeling of cosmic connectedness. I didn't use the word 'cosmic', and these are not theologians or systems people, but ordinary people who had a sense that the universe was a seamless fabric; it was interconnected. That's one part. Secondly, they didn't believe that it was just here, the result of pure blind mechanism. There is a force, a god, call it what you want, behind it or an expression of it. Third, we were put here to do good, to find meaning and purpose in our lives. There were ways to say that God or whatever you call it is an ultimate ground or guarantor for being and it has consequences. A lot of people, not everybody, said if you believe this, your business had to do good. It had to produce ethical products and services.

Q: Let me quote from the book about that because here is where you manifest that integral perspective of the individual and relationship to the culture in the system. You say,

> The data suggests strongly that those organizations that identify more strongly with spirituality or that have a greater sense of spirituality have employees who are less fearful for their organizations, are far less likely to compromise their basic beliefs and values in the workplace, perceive their organizations as significantly more profitable and report that they can bring significantly more of their complete selves to work, especially their creativity and intelligence, two qualities that are especially needed if organizations are to succeed in today's hyper competitive environment.

A: Yes, that kind of summarizes it, which is what previous studies or non-existent studies hadn't done. Here's another point of it. I didn't say it, but I would say it now, is that among the many qualities in which academic institutions or departments are lacking, first of all they don't have a sufficient enough systemic or integral vision or philosophy, but they're lacking sorely in any spiritual development. I'm convinced everybody in the world ought to be in therapy or in some spiritual program. That's a given. But I think universities sorely need it, because if you take what Ken and other people take seriously, you cannot have anything pretending to be knowledge independently of these paths and states of development. Ken says it many times, he can tell a person's level of development by their definition of leadership. I can tell a person's level of development by their definition of knowledge: what they regard as true, good or beautiful or however you want to put it. So everything is a reflection, by definition, of our development.

Q: *Interestingly since the early 80's, you've been really an advocate of people paying attention to Ken's work. I'm wondering if you can say a little bit about how your relationship with Ken has evolved over the years and what you think we need to be paying attention to around his work?*

A: That's a good question. A few years ago, I can't remember after what book I read, I was tempted to call him on the telephone. I got his number and as one knows, Ken is notorious in not returning phone calls. But I did happen to get his email and said I'd like to come and meet him. I trekked out to his home. He had been living up in the mountains behind Boulder and we spent a day together. Then I came back for the first of the integral business meetings.

Ken is a most unusual, if not daunting character and I say that with great affection. I know very few other people who could seclude themselves for that amount of concentrated energy for his writing. I've said to him in writing and in person, every time I read one of his books, I feel like two-thirds of it I've already heard. But it's not just sheer repetition; it's like a deeper appreciation. He goes over it, but something is added each time, so it's enriched.

I haven't found anybody as comprehensive as Ken Wilber. There well could be; it's not that I know everything, but I read a lot and look for comprehensive minds. I got that when I was taking this three and a half year minor because there was not only West Churchman there, but also one of his teachers, Thomas Cowan. Cowan constantly scoured the intellectual landscape for people who were deep and comprehensive. Tom Cowan would have found him above all people. Tom Cowan was a professor of jurisprudence. He read James Joyce because in *Finnegan's Wake* Joyce has a lot to say about the law.

But there was no one else when Ken's work came out. I read his original grid of internal/external and then the individual and the organization and how he got there by literally one day sorting on the floor all these different religious traditions and voila, this framework appeared to him. He had Don Beck's work and you could see the states of development West and East. Some people have obviously hinted about this before, you know, the people that had come before Ken that he cites, but I didn't find anybody else. I wish that Ken were closer. I'd have more frequent contact, but I do understand that Ken would literally be besieged if he took all the speaking engagements. I wish he would selectively come out and speak in a few highly select gatherings.

Q: *How would you describe your relationship to Integral Institute and Integral University?*

A: They are not as close as I would like them. I have just fallen out of the loop and I don't know why, because I would really like to be more involved for a lot of reasons. The most fundamental is that I don't think I would describe a university as a university any longer unless it was integral in a deep way. I certainly would not describe something as knowledge or, let's put it this way, it's a lower form of knowledge. In that sense, it fails. The current university almost never asks—almost like our political institutions—why they are such failures. Some do, but you can say why, with all this knowledge of crises, have we failed to have this impact in the world?

It's as my wife reminds me, and I know it myself, the opening passage of A.A. Milne's *Winnie The Pooh* has Christopher Robin dragging Winnie the Pooh down the stairs. He's dragging Winnie by its foot and with each step down the stairs, Winnie's head is going bump-bump-bump. As this is happening, Winnie is thinking to himself, if only my head could stop bumping, maybe he could figure a better way of coming down the stairs. Well, that's kind of symptomatic of our times, except the bumps are big: wars, pollution and all the problems we have. Again and again, there are really illustrations that the problems we have are the direct consequences of the current level of development or low level of development and as such they cannot be solved at that level.

The Challenge of Development

Q: *Let's talk about the idea of development for just a minute. You've mentioned William James and of course he had his developmental model about the intellectual or cognitive development of students that he's studied. He found that in the course of a four-year college education, they would develop one level. There have been some follow-up studies with engineering students in Colorado and Pennsylvania, for example, that affirm this pace of development that occurs in higher education. So, in terms of development, do you see a great hope for verticality?*

A: Yes and no. Let me back off and give you a philosophic musing about that. It also comes from William James because I ruminate a lot about this. I get epiphanies. One of the famous passages of William James—I'm not sure whether it's varieties of religious experience or his essays on pragmatism—but he has this passage where he says, "Imagine that we were present at the moment of creation and the creator put this basic bargain or question to you." The creator says, "Now, I can give you a universe that is completely fixed, determined. There will be no good, no evil, your actions will make no difference, or I can give you a universe that is open, uncertain, your actions will make a direct difference. What do you choose, choose wisely." James chose the latter. Hold that thought and let me bring it together with another thought.

If you read modern physicists, they are really doing scientific metaphysics. They're taking Einstein, and extrapolating to the whole of the universe. They don't really understand that by doing this they're being metaphysical. They just think they're being imaginative. There is a guy at Penn State (Lee Smolin?) who proposed using evolutionary biology coupled with cosmology. The outcome is that universes are continually being born, this guy speculates. Every time a universe is born, the fundamental physical constants get reset; like the ratio, the mass, the electrons, and protons. That affects whether stars and living things get born and so forth and so on.

I'm walking down the street one day and I said, "Why in the hell is it that we only have these big picture speculations from physical scientists? Why shouldn't the social sciences do the same? Here's the thought that came to my mind and I shared part of it with Ken one time. Suppose every time a universe is born, the ratio of good to evil is reset. We're apparently in a universe where the ratio of good to evil is slightly larger than one, but it seems like it's very close. I can't prove it, but I feel it. Back to William James, it's a real struggle. We don't know for sure whether goodness will triumph. Now, let's take it one step further. Here is the next step in the epiphany: Suppose every time a universe is born, it takes more or less time to transcend the stages of human development. So we're in a universe where it takes—you talk to Ken—roughly seven years of hard work to transcend, if you can, each stage. Well, given the span of the human lifetime, that's not much time for us to develop much.

So you can speculate. Suppose we were in a universe where it only took three or so years to span a level? What would that universe be like? We can't jump to one of those other universes. We can't do time travel, yet. Nonetheless, the ethical, moral imperative is, no matter what universe you're in, always act to increase the ratio of good to evil. Do everything you can to engage in transcendence in the universe where you find yourself. Maybe those principles, I'm just saying, are themselves indicative of different levels. But the point is that we almost never have that kind of conversation. Because we don't, we—all of us, including me—we fall into despair.

Q: *It's like we're living in a period where all those things, at least in our generation, we were raised to believe in about what this nation and its fundamental values are being challenged.*

A: I started off as a very poor kid, I mean really poor. I would not be where I am, well-off, with my wife, if I hadn't been born in California, had not gone through the University of California, gone to Berkeley, where I had almost free tuition, where I could take out student loans which were forgiven—in effect I got a free education. So, do I begrudge paying taxes? No, I really don't and I'm offended…

Q: *I saw a bumper sticker that said, "I'm a Democrat, please tax me."*

A: Yes, well I'm a recipient. I wouldn't be here were it not for the benefits of the state of California. I had to work hard and I had to have brains, but to give tax breaks to the super wealthy, what does that represent? When you talk about sliding back regression to the lower levels of development; that is so pathetic.

I think probably the most important question—because I know a lot of my liberal west side friends in L.A. have almost given up hope—they see this as the end of the American Empire, which may not be the worst of all things. Stop being the world's bully. They are in despair that the changes wrought by the Bush Administration may do irreversible or irreparable damage to the U.S. I'm afraid of that. What Katrina showed: poor, mostly black people like rats—I think that had a profound impact visually on even a lot of conservative Republicans. They too, are disenchanted. Whether that will translate in voting or whatever, that's another thing.

Q: *What you seem to be advocating, for example, in your book Crisis Leadership, is a shift from being reactive to being proactive in dealing with all of the crises and the issues that we're faced with.*

A: But here's the rub: You cannot be proactive. The word proactive is a low level way of saying higher development. Most people really get hung up on hierarchy. It's a post modernism politically correct crap where they think of rigid hierarchies. It's a bad word, so they don't want to say something is better than or worse than anything else. **By avoiding better or worse, in fact, they are saying it's better to avoid better or worse. So they've just done it. That's the irony of their position.** It's not only relativism, but also postmodern crap! They think post modernism is 'better than.' It is the only correct way. You can't be proactive unless you've reached a different stage of development.

What's Next?

Q: *Given this history, what are you working on now and where do you see your next phase going*?

A: I'm working on a variety of both popular and more intellectual books. I wouldn't say scholarly. You have to go out into the world of big publishers with agencies. One is a book on un-reality. The main title would be *America the Delusional*. My wife has a Ph.D. in education and she worked at the Pittsburgh public television station with Fred Rogers [Mr. Rogers—a popular children's program]. We're working on a very popular book applying Fred Rogers to the world of work. That's a more popular way to talk about a lot of the stuff that is really too difficult for most people to read. Although they need it, they avoid it. I work between a variety of projects and they are all interesting to me. I do have good students. I enjoy teaching. But what I think is really, really key is we have to get more integral universities and integral this and that. We really do.

Q: *I've heard that Integral University just established a relationship with the Fielding Institute [Santa Barbara, California]…*

A: That's interesting because Fielding is adult education.

Q: *…at the master's program level.*

A: That's good enough and that's a good start. I think Fielding is a viable alternative.

Q: *One of the challenges that is continually being cited since the 80's and many of your comments today have suggested is that we face a crisis of leadership in our society and in our businesses. Can you comment on what you see as being important for the future development of leaders and leadership in our organizations today?*

A: I think I've said it. The current leadership, again, is an expression of the current development of society and of organizations. What did we hear on national news this week? Verizon or Cingular is cutting back on their promised pensions to workers, even though they have the ability to pay them, because they are anticipating risk—or whether it is greed or whatever. There are exceptions for a few specialized organizations like Patagonia and some very special enlightened leaders who I think are more spiritually developed.

Q: *Like Herb Kelleher?*

A: Yes. People like that. Yvon Chouinar, the guy who runs Patagonia, just wrote a book, *Let My People Go Surfing*. He knows he has the kind of people who are dedicated and will not take advantage of the organization. How would you explain what he is about to, say, the head of GM because Ford and GM are failed companies now.

We could turn around the world and say certain societies are failed countries. They just don't work. Take Mexico. Maybe take us. They're failed. Largely, today's current organizations have failed. They reached the end of their lifecycle. They reached the end of the assumptions or the conditions to which they were responsive, mainly that level of development, World War II. But they have not made the transition to the 21st century. Bush is even farther back than that. He's in extreme regression. One of the things going on is this debate over intelligent design. It's laughable because there is a form of intelligent design. You want to talk about terms of integral philosophy that does make sense, but not in the ways that is being currently framed.

Q: *It's like the skeptics say evolution is not a theory; it's a fact.*

A: Yes, but even scientists don't get it. I accept evolution. It accounts for things pretty well. But what is it that sets the mechanism in place? Why do we live in a universe where evolution is possible? That's the way for me to frame it. How a "higher power" (or what) intervenes and at what level and I don't know? And then jump to, it intervenes because we have these complex mechanisms and intelligent design or the creation shows that people don't understand systems development! Therefore, it must have come into being all at once with all its properties—you can't have a conversation with people who believe this. One of the worst things I think has happened in this country, and I'm a part of it too, is that we're unable to converse now across the divides. I've never seen it so divisive, never in my lifetime. Have you?

Q: *No.*

A: Not even during Reagan and Nixon, not even at the height of the Cold War, not even at the height of the Vietnam War, which was divisive. Maybe because we've had 40 years of such division, I don't know. Do we have a basis for hope that we will transcend this? All I can say is, I really hope we do. I hope we have hope. I don't know what else to say.

Q: *Transdisciplinarity, not just in the academic sense, seems to be at least a theme that is something you would advocate. Do you have any notion of a transdisciplinary agenda or anything like that?*

A: I think it is the integral program and ideas that we've talked about. It's integral in terms of the scope of knowledge and the scope of the development of people and of humanity. So I'd say Ken's integral philosophy is a theory of transdisciplinary knowledge and development. It's one and it's as good as I know. I don't know of any others.

Most people have a low level meaning of interdisciplinary. They think, "Oh well, maybe I learn x and I learn y and I do joint studies of x and y together." That's not what Churchman's notion of interdisciplinary is. Every concept in every field of knowledge and every branch of knowledge **presupposes all** of the concepts or at least some of the concepts of every other field. That's very different. Take physics! You don't do physics as much as physicists would like to believe without human beings that are organized into communities. The laws of physics maybe are just "out there" but as far as they are known, they are known by people.

Q: This is an affirmation of a theme that I think you expand on and develop very well in Stakeholders of the Organizational Mind and the application of that seems to be what the integral approach is all about.

A: There is one place where I do disagree with Ken and I've talked to him about it. I do agree when he locates the 'it' in the exterior. If I go back to my first book, *The Subjective Side of Science*, yes there is an external world. I don't doubt that. But that external is only meaningful because there is an 'I', and internal world.

I don't like the words subjective, objective. I want to totally ban them from the vocabulary. They are outdated. Yes, there is a world that people regard as "it." That's the crucial point; **people regard it as it.** It does not regard it as it. That means there are people on the internal, left hand side that regard the external world as it. The right hand side is impersonal and objects and all the rest of that. But that's really a continuum. It's true that there are different senses of the right hand side; there are different concepts of the world and spirituality. I accept that, but it is misleading.

Q: One way that I think he's been trying to make that distinction more recently is that he would see in the lower right quadrant phenomena like communication, for example. But the means, the mechanisms, the computers, the telephones or what have you, of communication that are taking place, those are all artifacts.

A: I agree with that. I agree. Artifacts mean they are human artifacts. They are not artifacts of nature. The concept of nature itself is a human artifact. You could say the concept of the human body is now an artifact. In fact, in reality we are on the way—make no doubt about it—to becoming cyborgs. There is no doubt in my mind. What will happen if there is a line or lines when we will cross over and what will it mean to be human? The thing I would say about the internal and external dimension and even the 'I, we', those things are not only in flux as they have never been in human history, but more and more they are design possibilities. I'm not sure they are not also design nightmares. Mainly, that line is being manipulated and eroded by human beings.

Q: *There is an item in Ray Kurzweil's newsletter today that there is a meeting of people addressing the question of the legal aspects of people who are part human, part machine…*

A: …but my point is when is it going to be that we're going to have things that you can't even say are part what? That's almost quaint—their question. They're not looking far enough ahead. Here's what the intelligent design people don't get: that's not the problem. It's dumb redesigns that we are faced with when we got through all these redesigns of people.

Q: *Ian thanks. I look forward to your next book.*

A: Thank you.

Integrales Lernen in und von Organisationen

Wendelin Küpers

Abstract: Bezogen auf das integrale Models von Ken Wilber untersucht der Beitrag die Bedeutung des Lernens in und von Organisationen. Nach einer Darstellung der Relevanz und des Grundverständnisses des Lernens im Organisationskontext, werden integrale Dimensionen des Lernens dargestellt. Im Einzelnen werden die verschiedenen Sphären eines inneren-subjektiven und äusseren-„objektiven“ Lernens des Einzelnen als auch ein gemeinschaftliches Lernen und Lernen im System auf der kollektiven Ebene dargestellt sowie deren interrelationaler Zusammenhang diskutiert. Schließlich beschreibt der Beitrag noch integrale Lernprozesse sowie integrale Gestaltungsfelder zur Förderung des Lernens in den verschiedenen Bereichen. Abschließend spricht der Artikel noch Schwierigkeiten und Probleme an sowie nimmt im Fazit ein perspektivischen Ausblick vor.

Keywords: Integrale lernprozesse, integrale theorie, organisatorisches lernen.

Abstract: Related to the integral model of Ken Wilber, this paper investigates the role of learning in and of organisations. After describing the relevance and basic understanding of learning in the context of organisations, integral dimensions of learning will be outlined. In particular learning in the sphere of an inner-subjective and exterior-objective learning of the individual and a communal learning and learning within a system on the collective level as well as its interrelations will be discussed. Afterwards integral learning processes and various measurements for enhancing integral learning in the different sphere will be discussed. Finally, difficulties and problems will be addressed and in conclusion some perspectives and implications are presented.

Keywords: Integral learning processes, integral theory, organizational learning.

Einführung

Der folgende Beitrag versucht die integrale Vision und Philosophie von Ken Wilber auf den Bereich des Lernens für Organisationen zu beziehen. Dabei werden sowohl die lernrelevanten Bereiche des Ichs, der Gemeinschaft bzw. der Kultur sowie des Systems in einem umfassenden, ausgewogenen und dennoch spannungsreichen Beziehungskontext betrachtet. Integral bzw integrieren bedeutet dabei ein differenzierendes und zugleich zusammenzuführendes, vereinigendes und vernetzendes Vorgehen. Gemeinsamkeiten werden so zusammengebracht, ohne die Unterschiede und Spezifika zu leugnen. Diese integrale Orientierung versteht sich mit Wilber dabei nicht als eine endgültige oder festliegende Anschauung oder gar als einzig mögliche. Sie ist vielmehr nur eine Sichtweise, die aus verschiedenen wissenschaftlichen Disziplinen unterschiedliche Erkenntnisse und Forschungsergebnisse berücksichtigt und auf kohärente Weise einbindet sowie in einem evolutionären Gesamtzusammenhang betrachtet (vgl.

SOME RIGHTS RESERVED

Wilber 2000a, S. 14). Das Entwicklungsverständnis einer integralen Evolution versteht sich dabei nicht als starre, lineare Leiter, sondern als „eine fließende Angelegenheit mit Spiralen, Wirbeln, Strömungen und Wellenbewegungen – und einer fast unendlichen Anzahl multipler Modalitäten (vgl. Wilber 2000a, S. 18). Gerade dieses pluralistisch-integrale Verständnis ist für die Potenziale und dynamischen Prozesse des Wissens und Lernens wichtig. Denn Wissens- und Lernprozesse sind wesentlicher Teil der menschlichen Bewusstseinsentwicklung und evolutionären Transformation: „Die Dialektik des Fortschritts zeigt sich darin, dass mit dem Erwerb von Problemlösungsfähigkeiten neue Problemlagen zu Bewusstsein kommen.“ (Wilber 2001, S. 249). Zudem generiert der sozial-evolutionäre Lernvorgang selbst auf jeder Entwicklungsstufe neue Ressourcen, die neue Dimensionen der Knappheit und damit neue historische Bedürfnisse bedeuten (vgl. Wilber 2001, S. 249).

Eingebettet in diese evolutionären Gesamtzusammenhänge konzentriert sich der folgende Beitrag insbesondere auf den Bereich des Lernens in und von Organisationen. Den Konzepten eines „organisationalen Lernen“ bzw. der „lernenden Organisation“ wird in der aktuellen betriebswirtschaftlichen Forschung und Wirtschaftspraxis eine zunehmende Bedeutung für die Entwicklungsfähigkeit und für die Bewältigung des Wandels von Organisationen beigemessen (vgl. z. B. Argyris/Schön 2002; Brentel 2003; Eberl 1996; Huber 1991; Lembke, 2004; Wiegand 1996). Ist die Einsicht der Bedeutung des Lernens erst heute gewonnen worden? Haben Mitglieder von Organisationen nicht bereits früher gelernt? Warum ist ein integrales Verständnis des Lernens gerade gegenwärtig relevant? Um auf diese Fragen zu antworten, werde ich im Folgenden zunächst kurz in den Kontext und die Relevanz von Lernprozessen in Organisationen einführen. Aufbauend auf die Relevanz und das Grundverständnis des Lernens in und von Organisationen werden danach integrale Dimensionen des Lernens im Einzelnen und in ihrem Zusammenhang dargestellt sowie integrale Lernprozesse, Gestaltungsfelder sowie Probleme diskutiert. Ziel dieser Ausführungen ist es, die Bedeutung eines integralen Lernens im Organisationszusammenhang aufzuzeigen, damit diese zu einer lebendigen Wirklichkeit werden können.

Kontext und Bedeutung des Lernens in Organisationen

Selbstverständlich wurde schon immer in den Betrieben gelernt und gelehrt, gab es Lehrende und Lernende (vgl. Münch 1995, S. 88). So wurden bereits seit langem Organisationen als „Lernorte“ verstanden, die als soziale Kontexte das Lernen von Individuen beeinflussen und innerhalb derer Maßnahmen der Aus- und Weiterbildung insbesondere der Personalentwicklung ansetzten. Handelt es sich also bei organisationalem Lernen um einen „alten Wein in neuen Schläuchen“? Was erklärt die aktuelle Bedeutung des Lernens von und in Organisationen, die eine besondere Resonanz sowohl in der organisationalen Wirtschaftspraxis wie in der Organisationsforschung gefunden hat?

Für die Organisationspraxis ist die besondere Relevanz der Thematik u. a. auf organisationsinterne wie sozio-kulturellen Veränderungsprozesse rückführbar. Diese Veränderungen vollziehen sich einer durch große Unsicherheit gekennzeichneten Umwelt. Neben der Entwicklung neuer Informations- und Kommunikationstechnologien sowie grundlegender Veränderungen betrieblicher Organisationsformen und Wissens- und Wertschöpfungsprozessen ist es eine Intensivierung des Innovations- Wettbewerbsbedarfs, der einen steigenden Veränderungsdruck ausübt.

Es kommt zu einem „Wandel des Wandels“ (Mann 1993, S. 14ff), der durch wachsende Komplexität bestimmt ist (vgl. auch Klimecki/Probst/Eberl 1994). Diese äußert sich in der Vielfalt von vernetzten Einflussfaktoren und Ereignissen sowie einer beschleunigten Dynamik des Wandels. Veränderungsprozesse gestalten sich auch zunehmend diskontinuierlich, also unabsehbar und sprunghaft. Bewährtes Wissen, herkömmliche Routinen oder stabile Organisationsgefüge werden durch ständig neue Anforderungen in Frage gestellt. Mit immer neuen Projektaufgaben, Stellenwechseln und Fluktuationen von Organisationsmitgliedern gehen vielfältige Schwankungen einher, die eine kontinuierliche Zusammenarbeit wirkungsmächtig beeinflussen. Schließlich sind Wandlungsprozesse zunehmend nicht linear und finalistisch, sondern entfalten sich eher spiralförmig und mit offenem Ende (vgl. Weick/Quinn 1999, S. 382).

Diese Einflusskräfte und neuen Bedingungen des Wandels bringen es mit sich, dass Organisationen sich von der Vorstellung absoluter Beherrschbarkeit, sicheren Prognosen und einmal festgelegter, weil zu einem bestimmten Zeitpunkt tauglicher Verhaltensmuster verabschieden müssen. Damit gehen Unsicherheiten und Ungewissheiten über die gegenwärtige Situation sowie zukünftige Entwicklungen einher. Auch müssen sich Organisationen zunehmend mit gegensätzlichen und paradoxen Anforderungen (z. B. Stabilität und Flexibilität; Kooperation und Kompetition) und Ambiguitäten auseinandersetzen (Handy 1994; Müller-Stewens/Fontin 1997). Schließlich gehen von Veränderungsprozessen und -maßnahmen systemische Rück- und Wechselwirkungen aus, die besondere Herausforderungen nicht nur an die Planung, die Organisation und die Führung, sondern an alle Organisationsmitglieder stellen.

Anbetracht dieses dynamischen und drängenden Kontextes werden von dem Konzept einer „lernenden Organisation“ bzw. „organisationalen Lernens,“ Möglichkeiten erwartet mit den damit einhergehenden Herausforderungen konstruktiv umzugehen. Denn die beschriebenen externen und/oder internen Herausforderungen können durch die Organisationen nicht (mehr) in herkömmlicher Weise begegnet werden (vgl. Dodgson 1993, S. 376). Um wirtschaftlich in dem beschriebenen Zusammenhängen zu überleben und sich weiterzuentwickeln ist eine Selbstevolution der Akteure und Lernprozesse in Unternehmen erforderlich, d.h. umfassende Entfaltung ihres emotionalen, körperlichen und geistigen Potenzials.

Neben einem “Verlernen“ (Hedberg 1981), also dem Überwinden von alten Routinen und Wissensstrukturen sind integrale Lernprozesse notwendig, um ganzheitliche Orientierungen und Entwicklungsprozesse in und von Organisationen zu gewinnen. Erst so vermögen es Organisationen der paradoxen Anforderung zu genügen, einen „stabilen Wandel“ zu organisieren und eine effektive Selbst- und Umweltanpassung zu realisieren. Mit anderen Worten: Lernen ermöglicht, dass Organisationen ihre eigenen Strukturen so arrangieren können, dass sie einerseits die Identität der Organisation gewährleisten. Andererseits aber auch soviel Spiel- und Entwicklungsräume behalten, um die eigenen Selbstfestlegungen überraschbar bzw. variabel zu halten und auch wieder auflösen oder verändern zu können. Denn das Erleben und die Selektion von Diskontinuitäten, Unterbrechungen und Etablierung neuer Kontinuitäten bzw. Variationen ist eine Bedingung der Möglichkeit des Lernens (vgl. Kranz 2000, 124). Die Leitbilder eines „organisationalen Lernens“ bzw. einer „lernenden Organisation“ versprechen so zu einer Bewältigung des organisationalen Wandels beizutragen. Denn sie vermitteln dem Unternehmen Möglichkeiten zur Entwicklung bzw. Aktivierung notwendiger und Gestaltungs- und Anpassungspotenziale.

Für die Organisationsforschung stellt organisationales Lernen ein wachsendes und zunehmend bedeutsames Forschungsfeld dar. Mit seiner Offenheit und Ambiguität sowie dynamischen und positiven Konnotation und Qualität als Beobachterkategorie, erlaubt der Lernbegriff

Organisationsforschern scheinbar einen gemeinsamen Problembezug und Diskussionsbasis zu finden. Wie der Kulturbegriff, organisiert der Lernbegriff unterschiedliche Interpretations- bzw. Betrachtungsweisen und verschiedene Verwendungs- bzw. Erkenntnisinteressen in einer Debatte.. Von dem Konzept erhofft man sich Organisationen bzw. organisationale Lernprozesse und hierbei wirksame Einfluss- und Vermittlungsgrößen in deren Komplexität besser zu verstehen und zu erklären. Für Praxis und Forschung zeigt die Fülle der Literatur und Rezeption zum Thema einen großen Bedarf an Reflexion, um die sich real vollziehenden Veränderungen zu bewältigen bzw. theoretisch aufzuarbeiten (vgl. z. B. Reinhardt 1995, S. 314).

Das integrale Modell kann dazu einen wertvollen Beitrag leisten. Ein integrales Verständnis von Wissen und Lernen ist für die betriebswirtschaftliche Theorie und Wirtschaftspraxis relevant, weil damit;

1. die begrenzte Auffassung herkömmlicher Ansätze und deren Mangel an integralem Entwicklungs- und Transformationsverständnis überwunden und ein erweitertes und zugleich vertieftes Verständnis von Wissens- und Lernprozessen gewonnen werden kann,
2. eine integrale „Gesundheit“ in Organisationen auf horizontaler und vertikaler Weise als notwendig erkannt und lebensweltlich konkret entwickelt werden bzw. eine Transformationspraxis zu dessen Verwirklichung aufgezeigt wird,
3. Perspektiven für eine nachhaltige Integration von spezifischen Wissens- und Lernprozessen in Organisationen zugänglich werden,
4. spirituelle Dimensionen, die meist vernachlässigt oder nicht beachtet werden aber für Organisationen und ihre Mitglieder von grundlegender Bedeutung sind (vgl. Hawkins 1991) berücksichtigt werden können,
5. Möglichkeiten integraler Organisations- und Managementformen als eine spirituelle Praxis sich eröffnen (vgl. Butts 1999; Conger et al. 1994; Dehler/Welsh 1994; Bolman/Deal 1995).

Grundlegend kann eine integrale Ausrichtung von Lernprozessen in Organisationen und ihren Mitgliedern dazu dienen, deren aktuellen wie auch zukünftige Herausforderungen in den Lebenswelten von Organisationen zu bewältigen. Bevor im Weiteren das integrale Modell von Wilber auf Lernprozesse in Organisationen bezogen wird, gilt es zunächst zu klären, was unter Lernen im Allgemeinen und unter „organisationalem Lernen“ im Besonderen zu verstehen ist.

Grundverständnis des organisationalen Lernens

Allgemein führt Lernen über Erfahrungsprozesse zu einer überdauernden Verhaltensveränderung und neuen Fähigkeiten bzw. Erlebnis- und Handlungsmöglichkeiten im Verhältnis zur Umwelt (vgl. Angermeier/Bednorz/Schuster 1991, S. 27; Bower/Hilgard 1981, S. 32). Es hat also sowohl innere wie äußere Bezüge, die wiederum beide in umfassendere Kontexte eingebettet sind. Grundlegend kann Lernen als die Fähigkeit charakterisiert werden, bestehende Denk- und Handlungsmuster zu revidieren und sich dabei zielgerichtet Veränderungen anzupassen bzw. neue Orientierungen zu entwickeln. Dabei beschränkt sich der Lernprozess nie nur auf abgrenzbares „Wissen“ als Lerninhalt bzw. -ergebnis, sondern umfasst immer auch die gesamte (Lern-)Situation mit all ihren Vorkommnissen, Aktionen und Reaktionen, z. B. Ressourcen, Freiräume, Kommunikationsstrukturen, Anwendungsmöglichkeiten, Feedback zu Lernerfolgen (vgl. auch Bertels 1997, S. 58). In einem erweiterten Sinn kann Lernen sogar als eine Art und Weise zu „sein“ überhaupt verstanden werden (vgl. Vaill 1998).

Erkenntnisse über Ursachen und Prozesse sowie Wirkungen des Lernens wurden in unterschiedlichen Lerntheorien systematisiert. Damit wurde versucht ein je spezifisches Verständnis von Lernprozessen sowie Prognosen über Lernergebnisse und Lernfortschritte zu gewinnen. Entsprechend können verschiedene, z. B. behavioristische, kognitivistische sowie konstruktivistische Lerntheorien unterschieden werden, auf deren Einordnung und Gefahren eines Reduktionismus noch zurückzukommen sein wird.

Wenden wir uns hier nun dem spezifischen Lernen in und von Organisationen zu. Die wissenschaftliche Diskussion und Anwendungspraxis der „lernender Organisation" und „organisationalen Lernens" ist durch Heterogenität und Vielschichtigkeit sowie durch das Fehlen einer einheitlichen, allgemein akzeptierten Theorie bzw. Konzeption gekennzeichnet (vgl. Hennemann 1998, S. 9f.; Eberl 1996, Huber 1991, Wiegand 1996). Nachfolgende Definition integriert verschiedene Ansätze (vgl. u. a. Probst/Büchel 1998, v. Krogh/Ichijo/Nonaka 2000) und folgt dabei einem anwendungsorientierten Verständnis der Organisationstheorie, welches zur Lösung praktischer Probleme beizutragen versucht.

Organisationalem Lernen meint einen Prozess zur Erhöhung und Veränderung der organisationalen Wissensbasis, der wiederum die Problemlösungs- und Handlungskompetenz verbessert sowie Verhaltensweisen von und für Mitglieder innerhalb der Organisation erweitert.

Diese praxisorientierte Definition beinhaltet einzelne Kriterien, die im Folgenden kurz erläutert werden. Eine organisationale Wissensbasis bezeichnet die in einer Organisation verfügbaren Wissenselemente (z.B. Fakten, Regeln, Rezepte, Routinen, Normen, Standards etc.) und ihrer Beziehungen. Wie eine Art „organisationales Gedächtnis" (vgl. Walsh/Ungson 1991) bestimmen diese auch unbewusst das Denken, Entscheiden und Handeln von Organisationen und ihrer Mitglieder mit. Für ein bewusste Bearbeitung müssen die Inhalte dieser Wissensbasis von den Organisationsmitgliedern allerdings verstanden, bearbeitet und gedeutet werden sowie als anerkannt, verknüpfbar und nützlich gelten. Organisationales Lernen verändert und restrukturiert nun diese gemeinsamen Orientierungsmuster oder schafft neues Wissen. Kompetenzen zur Lösung von Problemen und zum Handeln umfassen Qualifikationen zur Erfüllung bestimmter Ziele oder Aufgaben. Dazu gehören neben fachlichen Kenntnissen auch Gestaltungs- und Umsetzungsfähigkeiten wie emotionale und soziale Kompetenzen. Über organisationale Lernprozesse können diese Kompetenzen gewonnen oder weiterentwickelt und so verbessert werden. Schließlich erweitert sich durch das organisationale Lernen auch das Repertoire der Möglichkeiten der Organisation (vgl. Wiegand 1996, S. 15). Damit können sich Organisationen und ihre Mitglieder nach Innen und nach Außen flexibler ausrichten und agieren.

Aus ökonomischer Sichtweise ist das Ziel des Lernens von Organisationen zum Leistungsprozess des Unternehmens beizutragen (vgl. Dodgson 1993, S. 378). Damit soll die Überlebens- und Wandlungsfähigkeit in einem von Wettbewerb bestimmten Marktkontext gesichert und gefördert werden. Organisationales Lernen zielt dabei im Besonderen auf eine Strategieentwicklung, Strukturgestaltung und Weiterentwicklung von Markt-, Kunden- und Umweltbeziehungen (vgl. Sattelberger 1991, S. 13), um das Handlungs- und Innovationsvermögen und damit Wettbewerbsvorteile zu gewährleisten. Das Lernen in und von Organisationen dient dabei auch einem kritischen Hinterfragen bereits vorhandener Regeln, Praktiken, Kompetenzen und relevanter Organisationsprozesse (vgl. Hennemann 1998, S. 163ff.). Auch unterstützt es den Aufbau von zukünftigen Kernkompetenzen bzw. Aktionsspielräumen und die Bereitstellung alternativer Lösungsansätze. Schließlich zielt es auf die Entwicklung grundlegender Lernpotenziale und -fähigkeiten. Diese dienen gerade in Zeiten einer sich radikal wandelnden internen und äußeren Umwelt der Organisationen auch als Vorsorge gegen Unsicherheiten der Zukunft. Dass über diese ökonomischen Bestimmungen hinaus, auch erweiterte Möglichkeiten einer individuellen, sozialen und kulturellen sowie systemischen Transformationspraxis gewonnen werden können, soll die nun folgende Darstellung integraler Dimensionen des Lernens in und von Organisationen zeigen. Zunächst wird dazu eine ganzheitliche Wirklichkeitssicht des Lernens und danach das integrale Modell vorgestellt und für das Lernen im Organisationszusammenhang fruchtbar zu machen versucht.

Holons und Holarchien: Die ganzheitliche Wirklichkeit des Wissens und Lernens

Grundlegend wird mit dem integralen Modell von Ken Wilber wird eine multidimensionale Integration angestrebt, welche die Wirklichkeit als ein Zusammenhang von Teilen und eines Ganzen versteht (Holon). Jedes Holon, das simultan eine innere und eine äußere Dimension hat, besteht also zugleich aus Ganzheiten und Teilheiten die in einem offenen Kontext miteinander verbunden sind. „Es gibt kein Ganzes, das nicht auch zugleich Teil von einem anderen Ganzen wäre, und dies setzt sich unendlich fort.“ (Wilber 2000, S. 41). Wilber (2001, 63ff) beschreibt vier Grundvermögen von Holons: Selbsterhaltung, -anpassung, -transzendenz und -auflösung. Zudem emergien Holons also lassen wie aus ihrer Vernetzung neue Eigenschaften und Konfigurationsmuster i. S. zunehmender Ganzheit/Teilheit entstehen (vgl. Wilber 2001, 71ff). Dabei transzendiert und inkorporiert jedes emergierende Holon seine(n) Vorläufer (vgl. Wilber 2001, 77ff). „Alle Grundstrukturen und Grundfunktionen werden bewahrt und in eine größere Identität aufgenommen“ (Wilber 2001, 78).˙ Das Niedrigere setzt zudem die Möglichkeit des Höheren, das Höhere setzt die Wahrscheinlichkeit des Niedrigeren (vgl. Wilber 2001, S. 80f).

Bei all dem bestimmt die Anzahl der Ebenen die Tiefe der Hierarchie, wobei jede weitere Evolutionsstufe zu einer Vertiefung führt. Dabei unterscheidet Wilber zwischen einer horizontale Translation der Oberflächenstruktur und einer vertikalen Transformation der Tiefenstruktur (vgl. Wilber 2001, S. 86). Während Hierarchien durch eine wachsende holistische Kapazität verstanden werden und Heterarchien als nicht-hierarchische Interaktion der zu integrierenden Elemente aufgefasst werden (vgl. Wilber 2000, S. 31), implizieren Holarchien, eine Balance des Hierarchischen (qualitative Ebenen) und des Heterarchischen (wechselseitig verbundenen Dimensionen). Dass das Wirkliche zugleich ein Ganzes und Teil (anderer Ganzheiten) ist, kontextualisiert auch die Wirklichkeit – und damit das organisationale Wissen bzw. Lernen und die lernende Organisation – in einem offenen (ko-evolutionären) Zusammenhang (Holarchie). Holarchien ko-evolvieren in Feldern von Feldern von Feldern (vgl. Wilber 2001, S. 91f), wobei Mikro und Makro auf allen Ebenen in Beziehung und Austausch miteinander stehen (vgl. Wilber 2001 S. 94).

Grundlegend nimmt die schöpferisch emergierende Evolution die Richtung zunehmender Differenzierung, Vielgestaltigkeit, Komplexität und systemischer Organisation ein. Das Zusammenwirken von Differenzierung (neue Teil- und Vielheiten) sowie Integration (neue Ganz- und Einheit), welches das Muster von Holons ausmacht *ist* dabei seine integrative Kohärenz (vgl. Wilber 2001, S. 97) die zugleich durch eine zunehmende Strukturierung, relative Autonomie bestimmt wird (vgl. Wilber 2001, 100f). Das gemeinsame Muster aller Evolution und Höherentwicklung ist dabei eine „Holarchisierung“ (Wilber 2000, S. 52), bei dem

Teilcharakteristika in einem umfassenderen Sinn einer kohärenten Einheit zusammengeführt und verknüpft werden.

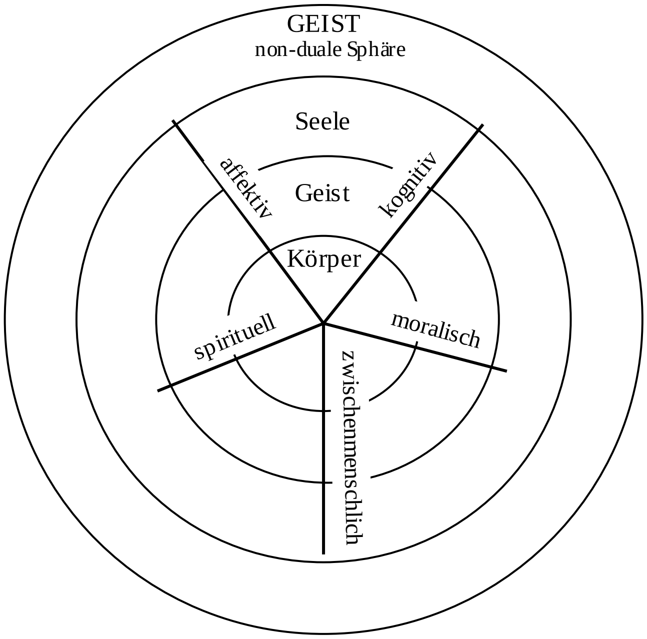

Abb. 1: Die Holarchie der Entwicklung (vgl. Wilber 2001a, S. 59).

Folgende Abbildung zeigt ein entwicklungorientiertes Modell der Holarchie bei dem die Ebenen als Bewusstseinsstufen als Körper, Geist, Seele und GEIST (als non-duale Seinsweise) – die sich alle aufsteigend integrieren – von verschiedenen Entwicklungslinien oder -strömungen, z. B. emotional, kognitiv, moralisch, zwischenmenschlich, spirituell durchzogen werden.

Bei Menschen können verschiedene Strömungen unterschiedlich ausgebildet und entwickelt sein. So können sich Mitarbeiter und Führungskräfte in Organisationen in ihrem Alltagsleben gleichzeitig auf verschiedenen Ebenen und Entwicklungsniveaus bewegen (vgl. Torbert 1994; Küpers 2004). Auf die Bedeutung dieser Ebenen und Linien der Entwicklung für das Lernen in und von Organisationen wird noch zurückzukommen sein.

Grundstruktur des 4-Q-Modells und Lernsphären

Die Bedeutung einer integralen Sicht von Lernen in und von Organisationen kann mit Hilfe des 4-Quadranten Modells von Wilber (1997, 2001) erschlossen werden. Aufbauend auf dem zuvor beschriebenen holonischen Wirklichkeitsverständnis, schlägt Wilber als wesentliche Differenzierungen vor zwischen innerlichen und äußerlichen sowie individuellen und kollektiven Quadranten zu unterscheiden. Die sich daraus ergebenden vier Quadranten sind die vier Dimensionen jedes Holons. Diese stellen zugleich je eigene „Welten“ (Binnen-, Handlungs-, Mit- sowie Sach-/Umwelt) mit je spezifischen Dimensionen dar. Folgende Abbildung zeigt die Grundstruktur des Modells mit einigen beispielhaften Bestimmungen hier angewandt für die Organisation.

Die oberen beiden Quadranten beinhalten die individuellen Sphären des Einzelnen. Während der obere linke (Bewussteins-) Quadrant (I) sich auf die Binnenwelt des intentionalen, denkenden, fühlenden und wollenden Subjektes („Ich“) bzw. Qualitäten des Individuellen bezieht, umfasst der obere rechte (Verhaltens-) Quadrant (II) die Handlungs- und Wirkwelt des Individuellen („Mein, Es“). Diese ist neben äußere materiellen-biologischen Manifestationen des Verhaltens auch durch handlungspraktische Dimensionen des Wissens, Kompetenzen und

Ausführungsweisen bestimmbar.[1] Diesen oberen Bereichen des Individuums bzw. des Individuellen stehen mit den beiden unteren Quadranten kollektive Sphären gegenüber. Der untere linke (Kultur-) Quadrant (III) verweist auf die gemeinschaftliche Sphäre („Wir), also auf eine innere, sozio-kulturelle „Mitwelt.“Dieser wird durch den unteren rechten (System-) Quadrant (IV) funktionaler Zusammenhänge in der äusseren Sach- bzw. Umwelt ergänzt („Unser, Es“). Als Spalten betrachtet, repräsentieren die beiden rechten Quadranten die Felder objektiven bzw. objektivierenden Außenaspekte: das obere i. S. der Einzelphänomene, das untere i. S. vernetzter Systemphänomene. Die beiden linken Quadranten stehen dagegen für die Felder der Innerlichkeit: Das obere verweist auf die „individuelle Innerlichkeit,“ während das untere ein „kollektives Innen“ repräsentiert.

Diese analytischen Differenzierungen und dualistische Konzeption ist selbstverständlich nur ein verständnisförderndes Konstrukt, das nicht beansprucht die „Wirklichkeit“ wiederzugeben. Wie eine Landkarte ist dieser integrale Bezugsrahmen für eine Orientierung und Klärung der einzelnen Elemente und Dimensionen des Lernens sowie ihres Verhältnisses zueinander förderlich. „In realitas“ ist der Bereich des Subjektiven und deren Innenwelt unaufhebbare mit dem „Außen,“ der Handlungs- und Wirkwelt verbunden, wie auch die Außendimensionen des Individuellen immer auf dessen „Innen“ zurückverweisen. Auch gibt es kein gemeinschaftliches Kollektiv ohne einen funktional-strukturellen Systemzusammenhang wie umgekehrt. Zudem bedingen und beeinflussen sich die individuellen und sozialen kollektiven Gesamtbereiche wechselseitig.

Angewandt auf das Thema des Lernens und Bezug zu den einzelnen Quadranten können entsprechend spezifische *Lernsphären* unterschieden werden. Quadrant I bezieht sich auf das

subjektive Lernen, während der Quadrant II ein „objektives“ Lernen im Handlungsbereich impliziert. Auf der kollektiven Ebene verweist der Quadrant III auf ein zwischenmenschliches

---

[1] Die Zuordnung des Wissens in den oberen rechten Quadranten ist hier eine bewusste handlungsspezifische Schwerpunktsetzung, die für den Organisationskontext zweckhaft erscheint. Selbstverständlich ist das Wissen immer auch eine innere mentale Repräsentation (Quadrant I), ein soziales Vermögen (Quadrant III) sowie ein systemische Ressource (Quadrant IV) (vgl. auch Romhardt 2002). Ähnliches gilt für die Kompetenzen, die es auch in den anderen Sphären gibt. Hier sind damit die im Handeln und Verhalten sichtbaren Äußerungen von Individuen gemeint.

Lernen oder eine gemeinschaftliche Lernkultur, während der Quadrant IV sich auf ein „inter-objektives“ Lernen bezieht, welches Funktionen im äußeren Systemzusammenhang umfasst.

Wie bereits erwähnt, können den vier Bereichen verschiedenen Personalpronomen zugeordnet werden:.

- Die individuell-innerliche Sphäre (Quadrant I) korrespondiert mit dem lernenden „Ich“
- Die individuell-äußere Sphäre (Quadrant II) entspricht dem Lernqualitäten eines „Es“ (engl. It) und „Mein.“
- Die sozial-innerliche Sphäre (Quadrant III) meint das lernende „Wir.“
- Die kollektiv-äusserliche Sphäre (Quadrant IV) steht für Lerndimensionen eines systemischen „ES“ (engl. „Its“) und „Unser.“

Entsprechend gibt es eine jeweilige „Ich-Sprache“ und eine „Wir-Sprache,” die methodischen nach einem „Verstehen“ bzw. Interpretieren fragt (was bedeutet es für mich/für uns?) sowie eine „Es- oder Objekt-Sprache,” die nach einem Erklären und Kausalitäten fragt

Was will ich lernen?
Wie ist mein Selbstbild als Lernender?
Was fühle und denke ich beim Lernen?
Was sind meine Lernprobleme?
Lerne ich aus meinen Fehlern?

Was kann ich lernen?
Bin ich fit zum lernen?
Was ist mein Know-How?
Wie löse ich dieses Problem?
Wie werde ich besser durch „Learning-by-doing“?
Wie gut bin ich im Vergleich?
Wie wirkt sich das Lernen auf mein Handeln aus?

Was sind unsere gemeinsamen Lernziele?
Wie können wir zusammen lernen?
Was ist unsere Lernkultur?
Passt der/die zu uns als Lerngemeinschaft?
Welche Lernhindernisse haben wir?

Wie funktioniert dieser Lernprozess?
Welche Lernstrukturen sollten geschaffen werden?
Wie Lernprozesse und -ergebnisse bestimmen?
Wie kann die Lerneffektivität erhöht werden?

Abb. 4: Typische Fragen innerhalb des Vier-Sphärenmodells angewandt auf das Lernen in und von Organisationen.

(was tut es, wie funktioniert es?) (vgl. Wilber 2001, S. 187). Gemäß diesen verschiedenen Sprachen stellen sich für jeden Bereich typische Fragen, hier beispielhaft angewandt auf das Lernen in und von Organisationen:

Methodisch betrachtet, geht der linksseitige Weg mit seiner Orientierung auf der individuellen Seite eher dialogisch-interpretativ, hermeneutisch und bewusstseinserforschend vor. Demgegenüber folgt die rechtsseitige Ausrichtung eher einem monologisch-erklärenden, empirischen, positivistischen und formorientierten Ansatz.

Entwicklungsebenen und –linien des Lernens

Mit einem holonischen Verständnis eines integralen Lernens können zudem die zuvor erwähnten verschiedene Entwicklungsebenen und -linien berücksichtigt werden. In allen Lernbereichen gibt es demnach verschiedene Niveaus von *Bewusstheitsebenen* z.B. materielle, körperliche, seelische, geistige Stufen des Lernens. Auch sind verschiedene *Entwicklungslinien* des Lernens zu unterscheiden. Diese zeigen verschiedene Medien oder Bereiche der Entwicklung des Lernens, z.B. moralische, kognitive, emotionale oder ästhetische Dimensionen sowohl des Einzelnen wie des Kollektivs. Grundlegend kann analog zu den verschiedenen individuellen Entwicklungslinien auch eine Binnendifferenzierung von organisationsspezifischen Bewusstheitsstufen und Entwicklungslinien des Lernens angenommen werden. Genauso wie individuelle Entwicklungslinien können sich auch organisationalen Linien der Entwicklung im Innen und Außen sich gegenseitig verstärken oder blockieren. Auch hier gibt es also unterschiedliche Entwicklungsniveaus und -geschwindigkeiten der verschiedenen Bereiche. Mit den unterschiedlichen Bewusstheitsebenen und Entwicklungslinien ist ein „*Lernholon*“ auf eine agentische, also handlungsorientierte Identität des Einzelnen und eine kommunale Identität des Kollektivs wie auch auf eine subjektive Identität und eine objektiven Identität ausgerichtet. Folgende Abbildung zeigt diese Ebenen und Linien eines solchen „Lernholons“ im graphischen Zusammenhang.

Abb.5: Bewusstheitsebenen und Entwicklungslinien des Lernens.

Da sich diese Stufen der Bewusstheit und die Linien der Entwicklung in Organisationen je nach Primat und Ausrichtung mit-, gegen- aber auch unabhängig voneinander sowie mit je eigenem Tempo und Dynamik entfalten (vgl. Wilber 2001, S. 58), ist die Gesamtentwicklung des Lernens und der Organisation oft unausgeglichen. Mit der Differenzierung von

Bewusstheitsstufen und Entwicklungslinien werden zudem einseitige Orientierungen herkömmlicher Lernansätze erkennbar und überwindbar.

Reduktionismen beim herkömmlichen Lernverständnis

Wie bereits erwähnt, beeinflussen und durchdringen sich die verschiedenen Bereiche des Lernens in ihrer realen Konkretion wechsel- und auch gegenseitig. Zwischen allen Quadranten bzw. Lernsphären gibt es damit vielfältige Verflechtungen. Eine isolierte Betrachtung einzelner Bereiche bleibt unzureichend da die vier Bereiche immer in einem ganzheitlichen Zusammenhang unter Beachtung ihrer Interdependenzen zu sehen sind. Dies macht auch eine kritische Betrachtung herkömmlicher lerntheoretischer Ansätze deutlich, welche verschiedene Arten von Reduktionismen zeigen, die sich einseitig nur auf bestimmte Quadranten, Ebenen oder Linien fokussieren.

Während kognitivistische Ansätze Lernen als internen Informationsverarbeitungs- und Repräsentationsprozess von Erfahrungen des Einzelnen (Quadrant I) verorten, der zu einer Veränderung von Kognitionen (z.B. Präferenzen, Annahmen, Urteile) führt, sehen behavioristische Ansätze Lernen im Zusammenhang eines bloß äußeren Reiz-Reaktionsmechanismus der über Konditionieren das Verhalten beeinflusst werden kann (Quadrant II). Beim Konstruktivismus gibt es verschiedene Spielarten die sich jeweils auf verschiedene Sphären beziehen. Nach dem radikalen Konstruktivismus bilden lernende Subjekte die Wirklichkeit nicht einfach ab, sondern erzeugen sie selbst. Das Lernen ist demnach informationell geschlossen, d.h. Information werden nicht von Außen (Umwelt) aufgenommen, sondern selbst vom Subjekt (Quadrant I) auf der Grundlage seiner neuronalen Ausstattung (Quadrant II) erstellt. Lernen wird so zu einem aktiv-konstruktiven, selbstgesteuerten Prozess. Demgegenüber gehen Sozialkonstruktivisten von der Annahme aus, dass Lernen sich als (Interpretations-)Produkt einer Gemeinschaft (Quadrant III) ergibt, deren Mitglieder bestimmte Werte, Denktraditionen bzw. Interpretationspraktiken oder Arbeitsweisen miteinander teilen. Demnach bringen soziale Konstruktionen (z. B. Vorstellungen, Vorurteile, Urteile, Meinungen aller Art) wirklichkeitsschaffende Erkenntnisse und das Lernen hervor, d.h. Wirklichkeit wird hergestellt, indem auf eine bestimmte Art und Weise über sie gesprochen wird und dabei vielfältige Beziehungen koordiniert werden. Nach der neueren Systemtheorie ist Lernen als eine funktionale Systemleistung zu beobachten, die über eine wirklichkeitsschaffende leitdifferenzfolgende Unterscheidungs- und Kommunikationspraxis von sozialen Systemen stattfindet (Quadrant IV).

Mit den erwähnten Ausrichtungen wird die Gefahr verschiedener Reduktionismen deutlich. Ein *Kognitionsreduktionismus* ignoriert oder unterschätzt den äusseren Handlungsbereich (II) ebenso wie die wichtigen sozialen (III) und systemischen (IV) Einbettungen und Vollzüge des Lernens. Demgegenüber blendet ein behavioristischer *Verhaltensreduktionismus* die Innendimensionen des Einzelnen (I) und des Kollektivs (III) aus. Damit sind die wichtigen Fragen nach der Rolle des Bewusstseins, der Intentionalität sowie der Bedeutung und der Werte ausgeschlossen (vgl. Wilber 2001, S. 170, 178). Auch eine einseitige Ausrichtung auf neuronale Prozesse als der materiellen Basis des Lernholons (*materialistischer Reduktionismus*) isoliert das Lernen und dekontextualisiert es z. B. von der sozialen Lernkultur (III). Werden andererseits alle Holons des Inneren (I + III) auf die äußere untere Seite reduziert (*Funktionsreduktionismus*) wie bei der Systemtheorie oder in Technologieansätzen des Lernens, kommt es zu einer monologischen Vereinseitigung. Diese lassen mit ihrem reinen Beobachtungsstandpunkt und objektivierenden Beschreibung des Lernens als Funktion keinen Platz mehr für das Subjekt (I) und die Gemeinschaft (III) mit deren spezifischen Innenwelten.(vgl. Wilber 2001, S. 174).

Mit dem integralen Ansatz kann der einseitige Fokus der meisten Ansätze des organisationalen Lernens auf kognitiv-rationale oder funktional-systemische Vorgänge überwunden werden. Denn aus integraler Sicht ist Lernen immer auch ein psychodynamischer und emotionaler Erfahrungsprozess (vgl. Scherer/Tran 2001, Küpers/Weilber 2005). Daher müssen innere Dimensionen (Quadrant I) mit in ihrem Einfluss auf das Handeln und Verhalten (Quadrant II) immer im Zusammenhang mit den kollektiven Bereich (Quadranten III + IV) betrachtet werden. Beispielsweise tragen Emotionen nicht nur jede sprachliche Kommunikation und Interaktion, sondern sind auch Bedingung für jede zwischenmenschliche Kooperation (vgl. Maturana 1994, S. 30f.; Ciompi 1997, S. 250, 310f.). Denn ohne eine durch ”absichtliches oder intuitives emotionales Einstimmen” hergestellte gemeinsame Basis bleibt eine kognitive Mitteilung ”praktisch wirkungslos” (Ciompi 1997, S. 311). Zudem spielen Emotionen auch für das Lernen eine wichtige, energetisierende (z. B. Interesse, freudige Antizipation, Stolz auf Lernleistungen) oder lähmende (z. B. Angst, Stress, Ärger) Rolle. Auch hängt die Wirksamkeit des Lernens von der emotionalen Dynamik, die sich in Interaktionsprozessen entfaltet sowie von der Entwicklung und Praxis emotionaler Kompetenzen (vgl. Salovey/Mayer 1990; Goleman 1997, 1998) ab.

Im Weiteren werden die einzelnen Sphären besprochen und anschließend im Zusammenhang betrachtet. Zunächst werden die beiden Innen- und dann die beiden Außendimensionen kurz beschrieben. Wobei als Grundmuster das Innen als Bewusstsein und Tiefe, das Außen der Dinge als Form und Oberfläche bestimmt werden kann (vgl. Wilber 2001, S. 148).

Die einzelnen Quadranten bzw. Sphären des Lernens

Sphäre I : Inneres Lernen des Einzelnen (individuell-innerlich)

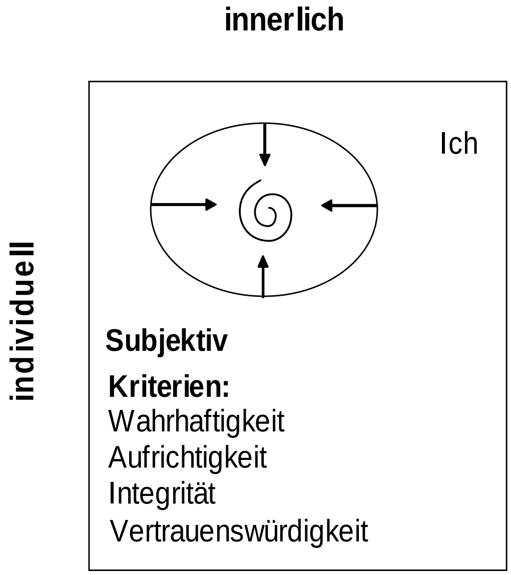

Abb. 6: Kriterien der Sphäre des Inneren Lernens (individuell-innerlich).

Inhalt und Zugang

In dieser Sphäre wird Lernen als Erfahrung eines intentionalen Subjekts („Ich“) verstanden. Diese Sphäre eines inneren Lernens umfasst sowohl Körperempfindungen, Gefühle wie auch Gedanken des Einzelnen als subjektiver Erfahrungsbereich. Inhaltlich kommen hier also die persönlichen (Lern-)Bereitschaften und Einstellungen und grundlegenden Werthaltungen sowie Lebenserfahrungen zusammen. Ein Zugang zu diesen Bereich kann durch bewusstes Selbsterleben und Selbstbetrachtung (Introspektion) gewonnen werden. Die hier notwendige Selbstuntersuchung kann durch Erkenntnisse der Phänomenologie, Methoden der Psychologie und Praktiken der Kontemplation bzw. Meditation unterstützt werden. Die zu diesem Bereich ko-respondierenden spezifischen Gültigkeitskriterien zur Überprüfung von Aussagen sind: Wahrhaftigkeit, Aufrichtigkeit, Integrität, Vertrauenswürdigkeit.

Lernen in und durch das Handeln („learning by doing“) stellt einen zentralen Lernprozess des Menschen dar. Analog zu der von Romhardt (2002, S. 59) beschriebenen Sphäre des „inneren Wissens“ macht dieser Bereich eines „inneren Lernens“ deutlich, dass wir uns als Menschen tief leiblich und emotional wahrnehmen und kognitiv verstehen müssen, um in wahrhaftiger Art und Weise nach Außen wirken zu können. Zur Praxis eines aufrichtigen und integeren wie vertrauenswürdigen Seins müssen Innen und Außen sinnvoll korrespondieren. Mit anderen Worten: Ohne ein reifes inneres Lernen kann kein wirkungsvoller äußerer Lern- und Gestaltungsprozess in Organisationen gewonnen werden. Damit stellt dieser Bereich eine wesentliche Grundvoraussetzung für das Lernen in und von Organisationen dar, wobei dabei auch Gefahren und Probleme einer einseitig individuums-zentrierten Ausrichtung zu beachten sind.

Beispiele von Gefahren und Problemen in diesem Bereich:

- Unterdrückung körperlicher Empfindungen (z. B. Stressbelastungen, Schmerz) und Verdrängung von Gefühlen (z. B. Angst, Aggressivität).
- solipsistische Selektivität kognitiver Inhalte und Prozesse (z. B. bestimmte Denkmuster, Rationalisierung von Motivation).
- Schwierigkeiten die innere Wahrhaftigkeit, Aufrichtigkeit und Integrität im (ökonisch-lebensweltlichen) Außen und Kollektiv zu leben, was u.a. zu emotionalen und kogntiven Dissonanzen führen kann (vgl. Küpers 2006).
- Egozentrische Ausrichtung des Lernens verkennt gemeinschaftliche und systemische sowie „weltzentrische“ Dimensionen und Perspektiven.

Sphäre II: Objektiviertes Lernen des Einzelnen (individuell-äußerlich)

Inhalt und Zugang

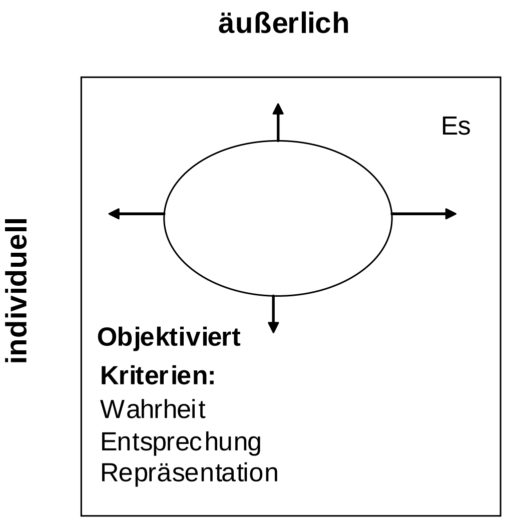

Abb. 7: Kriterien der Sphäre des objektivierten Außenlernens.

Dieser Bereich umfasst materielle, objektivierbare Vergegenständlichungen (vgl. Wenger 1998, S. 52) und organische-neurologische, also körperliche Grundlagen sowie äußere Standards für das Lernen des Einzelnen. Es beinhaltet die objektivierten Äußerungen des Einzelnen in Form von sich im Handeln manifestierenden und im Verhalten wirksam werdenden oder in ihren Folgen sichtbaren Kompetenzen und Motivations- und Entscheidungspraktiken. Ein Zugang zu diesem Bereich wird über erfahrungswissenschaftliche Methoden des Empirismus insbesondere der Verhaltenswissenschaften sowie Verfahren und Erkenntnisse der Neurowissenschaften gewonnen. Der Einzelne entwickelt in Auseinandersetzung mit den äußeren Bezügen Konstrukte, die Voraussetzung zum Urteilen in

Differenzierungen z. B. richtig/falsch, gut/schlecht oder wahr/unwahr sind. Damit können äußere Lernzustände und –prozesse beschrieben sowie deren Nützlichkeit bzw. Effektivität bewertet werden. Die Überprüfung äußere Zustände können dabei nach Kriterien bzw. Ansprüchen auf „Wahrheit," Entsprechung und Repräsentation erfolgen.

In dieser Sphäre geht es in Hinblick auf das Lernen insbesondere um eine Entwicklung und Verständigung über „objektiv" im Verhalten sich äusserenden Wissen, Vermögen und Kompetenzen. Darin wird das Lernen äußerlich praktisch und wirksam und vermittelt den ökonomisch relevanten Bezug zur Performanz und Leistungsprozessen. Zu der Aus- und Weiterbildung, Pflege und Entwicklung von verschiedenen Kenntnissen und Fähigkeiten, kommt auch der Aufbau einer methodischen Lernfähigkeit i. S. eines „lernenden Lernen," auf das noch im Rahmen integraler Lernformen zurückzukommen sein wird.

Die Problematik dieses Bereichs liegt beispielhaft darin:

- dass der äußerer Zustand im Organisationskontext nur nach ökonomischen Messgrößen, wie Nützlichkeit, Produktivität, Leistungseffizienz etc. bewertet wird.
- das Lernen der Agenten in Organisationen nur ökonomisch bestimmten Entsprechungslogiken folgen kann.
- dass die Repräsentation von Wissen und Lernen Kategorien benötigt, die von dem inneren leiblich-emotionalen Lernprozessen entfremden können.
- Einzelhandlungen ohne Verbindung zur Gemeinschaft und Kultur bleiben oft isoliert und nur begrenzt effektiv.
- Aktionismus ohne systemische Einbettung, führt zu fehlenden „Anschlüssen."

Sphäre III: Gemeinschaftliches Lernen / Lernkultur (kollektiv -innerlich)

Als Bereich des Zwischenmenschlichen und der kulturellen Rahmenbedingungen umfasst diese Sphäre die vorherrschenden sowie identitätsbestimmenden Erzählungen, Konventionen, und Regeln für Gruppen und Gemeinschaften. Die tradierten, wandelbaren, zeitspezifischen, auch über Symbole und Artefakte erfahrbaren Wertvorstellungen, Normen und Überzeugungen prägen das Erleben, Denken und Verhalten von Mitarbeitern. Gemeinsame Wahrnehmungen, Bedeutungen, semantische Standorte, kulturelle Praktiken als intersubjektive Muster im Bewusstsein beeinflussen maßgeblich die Lernkultur einer Organisation. Lernen wird dabei zu einer sozialen Leistung in einem gemeinsam geteilten Kontext. Zugang zu diesem Kulturbereich kann über eine verstehensorientierte Einfühlung von Innen und hermeneutischen Rekonstruktion des gemeinsam geteilten Kulturraums gewonnen werden.

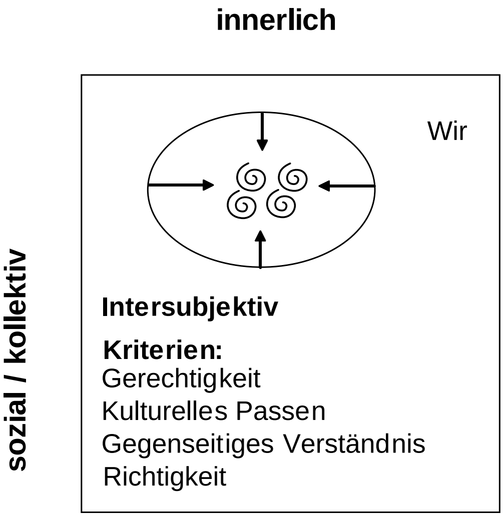

Abb. 8: Kriterien innerhalb der Sphäre der Lernkultur (sozial-innerlich).

Auf der Basis eines gegenseitigen Verständnisses darüber, was als „richtig" und „gerecht" gilt, organisieren die Mitglieder einer Kultur ihr Zusammenleben. Angepasstes

Verhalten wird dabei oft belohnt, während Abweichungen ggfl. sanktioniert werden. Die leitenden Überprüfungskriterien dieses Bereichs sind dabei Gerechtigkeit, kulturelleres Passen, Gegenseitiges Verständnis sowie Richtigkeit.

Eine gemeinsame (Lern-)Kultur ist eine grundlegende Voraussetzung für die Entwicklung einer integralen Lernpraxis in Organisationen. Ist sie nur eingeschränkt vorhanden oder von lernbehindernd gestaltet, kann sich ein integrales Lernen nur sehr begrenzt entwickeln. Nur auf dieser kollektiven (Lern-)Basis können ein organisationsweites Lernen und damit die Entwicklungsfähigkeit einer Organisation entstehen. Diese Sphäre ist auch der Entstehungs- und Gestaltungsort für lebendige *Lerngemeinschaften*. Diese Gemeinschaften des Lernens sind als Formen integraler Lernpraxis in besonderer Weise geeignet innovative und integrale Wissens- und Lernprozesse in Organisationen zu fördern (vgl. Brown/Duguid 1991; Küpers 2003; Wenger 1998, Wenger/Snyder 2000; Romhardt 2002). Denn als Keimzellen für die Entwicklung und Verlebendigung einer integralen Lernpraxis werden in ihr die individuellen, kollektiven sowie "harten" und "weichen" Faktoren in einer ganzheitlichen Weise berücksichtigt. Damit stellen Lerngemeinschaften wichtige Medien eines kollektiven und integralen Lernens dar und tragen der Komplexität und Dynamik des lernökologischen Zusammenhangs in besonderer Weise Rechnung. Dabei können sich praktische Lerngemeinschaften i. S. eines „Aufeinanderzulernens" (Wiegand 1996, S. 409) am besten in überschaubare, kleine Gruppen realisieren. Die Entstehung von miteinander geteiltem Gruppenwissen kann jedoch auch zur wissensbezogenen oder abteilungsegoistischen Abgrenzung gegenüber anderen Gruppen oder der Gesamtorganisation führen, was gruppenübergreifende Wissensweitergabe und organisationsweite Lernprozesse erschwert.

Die Problematik dieses Bereichs liegt darin:

- „Kultur" als „weicher" und zugleich tief verwurzelten Bereich und fragliche instrumentalisierbare Gestaltungsvariable für ein sozio-technokratisches Management ist nur begrenzt steuer- bzw. wandelbar, bzw. erfordert eine hohen Planungs-, Überzeugungs-, Kommunikations- und Kontrollaufwand.
- kulturelle Werte sind nicht als etwas beliebig Verfügbares und lassen sich nur begrenzt und allenfalls mittelfristig verändern.
- Gerechtigkeit, gegenseitiges Verständnis und Richtigkeit sind anspruchsvolle Kriterien die intersubjektiv immer neu zu verhandeln und zu bestimmen sind.
- Kulturelles Passen kann nicht ohne systemische Passungen gewonnen warden.
- Gruppendynamik und Group-think kann lernbehindernd sein.

Sphäre IV: Lernen im System (kollektiv-äußerlich)

Dieser kollektiv äußerliche Bereich enthält interobjektiven Strukturen, Funktionen und Prozesse des Kollektivs bzw. Systems. Der Zugang erfolgt methodisch-konzeptionell über eine Beobachtungsperspektive, mit der das Verhalten, Funktionen, Leistungen und Wirkungen sozialer Entitäten und deren (Lern-)Relationen erfasst werden. In diesem Systembereich geht es entsprechend um strukturelle Passung von Kommunikations- und Organisationsstrukturen und -prozesse sowie eine Sicherung der Funktionalität von Gruppen oder ganzen Organisationen.

Der Bezug zum Lernen ist hier insbesondere durch die technologische Infrastruktur, Ressourcen Zertifizierungen sowie weitere systemischen Zusammenhänge für das Lernen von und in Organisationen gegeben. Werden Organisationen als lernende „Entitäten" verstanden, kommt gerade diesem überpersonalen Bereich eine wichtige Bedeutung zu. Die

technologisches Optimierungsniveau

Abb. 9: Kriterien innerhalb der Sphäre des Struktur- und Systemlernens (sozial-äusserlich).

Gültigkeitskriterien sind hier neben dem funktionalen bzw. strukturellen Passen ausgerichtet auf systemische Netzwerkzusammenhang, Anschlusslogiken sozialer Systeme und ein technologisches Optimierungsniveau.

Organisationen und ein Lernen in und von ihnen sind ohne funktionale Strukturen bzw. Prozesse sowie grundlegende systemische Bedingungen nicht denkbar. Allerdings dominiert die Orientierung auf diesen Bereich häufig die Wirtschaftspraxis. So basieren viele Investitionen und der Einsatz von Instrumenten und Technologien auf dieses äußerliche Funktionssystem. Durch eine damit einhergehende Vernachlässigung der anderen Bereiche kann es zu einer Veräußerlichung des Lernens ohne individuelle und soziokulturelle Tiefe oder einer „Alles-und-jedes Ganzheitlichkeit“ (Flachlandholismus) kommen. Damit können sich Potenziale eines integralen und lebendigen Lernens des Einzelnen wie von Lerngemeinschaften nicht entfalten.

Die Problematik dieser Sphäre liegt in folgenden Gefahren:

- Entindividualisierung, Objektivierung und Entfremdung des Lernens Einzelner und Gemeinschaften.
- Instrumentelle Funktionalisierung bzw. Entwertung von subjektiven (Lern-)Erfahrungen.
- Fehlender Kulturbezug zum Lernen in Gemeinschaft.
- Fixierung auf Technologien und äußere Ressourcen.

Interrelationaler Zusammenhang der Sphären

Wie schon zuvor beschrieben, sind die vier (Lern-)Sphären bzw. Quadranten nicht getrennt voneinander zu sehen. Sie haben vielmehr vielfältige Wechselbeziehungen zueinander. Alle vier Bereiche des Lernens mit all ihren „Wirklichkeiten“ bzw. Perspektiven entwickeln sich immer im Zusammenhang. Ein integraler Ansatz berücksichtigt diese komplexen Wechselzusammenhang und reich strukturierten Interrelationen (vgl. Wilber 2000a, S. 66). Keine einzelne Sphäre lässt sich auf eine andere reduzieren (vgl. Wilber 2001, S. 164).Zwischen Außen und Innen sowie Individuellem und Kollektiven bestehen somit enge Korrelationen und eine lebendige Wechselwirksamkeit. Nur wenn alle Felder gleichermassen und gleichwertig berücksichtigt werden, können Organisationen und ihre Mitglieder zu einem integralen und damit nachhaltigen Lernen kommen. Gerade zur Lösung von Aufgaben und Problemen im Organisationsalltag sind sowohl die inneren wie äußeren Dimensionen des Lernen Einzelner notwendig. Zudem müssen sowohl eine innere Lernkultur bzw. -gemeinschaft sowie äußere, funktionale Lernstrukturen bzw. -systeme zusammen geschaffen, angeboten, koordiniert und weiterentwickelt werden. Folgende Abbildung zeigt die Wechselbeziehungen zwischen den vier Lernsphären und ihren Welten im Zusammenhang.

Diese Wechselrelationen werden zudem durch integrative Dynamiken und Wachstumsdynamiken Entwicklungsstufen und -linien und einen übergreifenden “*integralen Zyklus*“ (vgl. Edwards, 2005; Cacioppe & Edwards, 2005a,b) energetisiert und koordiniert.

Als ein holonistischer Prozess, ereignet sich Lernen in und von Organisationen somit als innerer und äußerer, individueller und kollektiver Zusammenhang, der die verschieden Quadranten sowie der Entwicklungsstufen und -linien in einem dynamischen Gesamtzyklus umfasst. Werden jedoch einzelne (Lern-)Sphären nicht hinreichend beachtet, kommt es zu Ungleichgewichten und Pathologien.

Konkrete Beispiele wären:

- Introspektions- und Reflexionsvermögen ohne hinreichende soziale Kompetenzen oder Kommunikationsfähigkeiten.
- Ausgeprägte kognitive (Lern-)Fähigkeiten ohne Beachtung ihrer Grenzen oder emotionaler Aspekte bzw. Kompetenzen (emotionale Intelligenz).
- Gruppen mit guter Lernkultur ohne Weitergabe oder funktionalen Anschluss an Gesamtorganisation.
- Informations- und kommunikationstechnologische Unterstützung von Lernprozessen (z. B. Computer Based Training), die von ihren Anwendern abgelehnt warden.

Eine parallele Betrachtung und gleichwertige Berücksichtigung der Themen, Potenziale und Probleme in allen genannten Sphären ist eine wesentliche Voraussetzung für eine differenzsensible integrale Entwicklung und Lernpraxis, die erst ein gelingendes innerliches und äußerliches Wachstum von Organisationen und ihren Mitarbeitern ermöglicht.

Mit dem integralen Modell können so verschiedene spezifische Qualitäten für lernende Organisationen eingeordnet werden (vgl. auch Pedler/Burgoyne/Boydell 1991, S. 127):

- Lernen aus eigenen Reflexionen und Erfahrungen (Quadrant I).
- Entwicklung von Lernfähigkeiten bzw. probierendes „Learning by doing“ (Quadrant II).
- Aufbau einer Lernkultur und gemeinschaftliches Lernen von und mit anderen (Quadrant III).

- Unterstützung des Lernens durch moderne Informations- und Kommunikationstechnologien (Quadrant IV).

Individuelles und kollektives Lernen im integralen Zusammenhang

Mit einem integralen Verständnis wird auch die wichtige Klärung der Lernträger und -ebenen in Organisationen gewonnen, der Frage also, wer in Organisationen auf welchen Ebenen lernt?

Einerseits vollzieht sich das Lernen als ein Geschehen von Einzelnen. Probst und Büchel (1998, S. 20) definieren individuelles Lernen als: „Veränderung im Verhalten oder im Verhaltenspotenzial ... hinsichtlich einer bestimmten Situation, die auf wiederholte Erfahrungen ... in dieser Situation zurückgeht, vorausgesetzt, dass diese Verhaltensveränderung nicht auf angeborene Reaktionstendenzen, Reifung oder vorübergehende Zustände zurückgeführt werden kann“. Sie sehen dabei diesen Lernbegriff als Funktion von folgenden verschiedenen Dimensionen: 1. der Erkenntnismöglichkeiten im Sinne von kognitiven Kategorien, 2. der Intelligenz, 3. der Erfahrung im Sinne von sozial vermitteltem Wissen und eingelagerten Fähigkeiten sowie 4. der historisch gewachsenen und situativ unterschiedlichen Bedürfnis- und

Motivlage des Einzelnen. Dazu kommen die Interessen und Werthaltungen einzelner Lernender einer Sache gegenüber sowie der individuell verschieden wahrgenommenen Schwierigkeitsgrade des Lerngegenstandes. Individuell Lernende nehmen Informationen auf, wandeln sie in Wissen bzw. erweitern eigene kognitive Strukturen um, darauf aufbauend, mittel- bis langfristig bessere Handlungsergebnisse zu erreichen. Die durch das Handeln erzielten Resultate geben dem einzelnen Lernenden Auskunft darüber, ob Lernfortschritte tatsächlich gemacht bzw. eine bessere Bewältigung der (Daseins-)Realität möglich geworden ist.

Holonistisch betrachtet, realisiert sich individuelles Lernen also auf bzw. durch alle Quadranten. Es manifestiert sich als Zuwachs an innerem Vermögen (z. B. kognitiver Komplexität), an äußerer Handlungskompetenz, an der ausgefüllten Rolle in einer Gemeinschaft oder am Grad seiner formal-institutionellen Operationalisierung. Ein individuell integral Lernender berücksichtig all diese Perspektiven und „tetra-evolviert“ sich lernend entsprechend.

In Ergänzung zu den genannten individuellen Lernprozessen gibt es jedoch auch Organisationszusammenhänge und Problemarten, die eine kollektive Lernform benötigen. Ein kollektives Lernen dient u. a. zur Lösung von Problemen, die sehr komplex sind, d.h. die nicht mit der individuellen Verarbeitungskapazität und individuellen Wissen allein gelöst werden können. Bei komplexen Problemen gibt es zudem häufig keine Entscheidungskriterien für eine „richtige“ Lösung, da kein bekannter Lösungsweg besteht und die Anzahl der notwendigen Bearbeitungsschritte weitgehend unbekannt ist. Um Komplexität zu bewältigen ist oft auch eine reflexive Veränderung von organisationalen Lerngewohnheiten (z. B. überholte Formen der Informationsbeschaffung, -selektion und -verarbeitung) erforderlich, was ein gemeinschaftliches Lernen erfordert. In solchen Lernzusammenhängen stehen dann nicht individuelle Motive, Bedürfnisse, Erfahrungen oder Werthaltungen bzw. Handlungen und Gemeinschaftsbezüge , sondern übergreifende Orientierungen und Erfahrungsbezüge, sozial verbindliche Entscheidungsverfahren oder eine normative Ordnung (vgl. Probst/Büchel 1998, S. 20) sowie Regeln und Standards (vgl. Kieser/Beck/Tainio 2001) im Vordergrund.

Hinsichtlich der Lernträger wird der organisationale Lernprozess also von Individuen getragen und entwickelt, ist aber auch partiell personen-unabhängig (z. B. über kollektive Wissensbasis oder Praxis- bzw. Lerngemeinschaften) organisiert. Das Lernen in Organisationen ist damit mehr und anderes als die Summe individuellen Lernens, denn er muss öffentlich kommunizierbar, transparent und konsensfähig sein. Zudem kommen auf der systemischen Ebene spezifische apersonale Dimensionen (z. B. die erwähnten äußeren Bedingungen, Strukturen, Ressourcen und Technologien des Lernens) zum Einsatz.

Integral betrachtet sind individuelles und kollektives Lernen mit ihren verschiedenen Sphären vielfältig und holonistisch miteinander verflochten. Damit ist das Lernen des Einzelnen zwar eine notwendige, keineswegs aber eine hinreichende Bedingung für organisationales Lernen. Einerseits ist individuelles Lernen als eine Rekonstruktion und Reorganisation von Erfahrungen immer schon sozial gestaltet (vgl. Elkjaer 1999). Andererseits sind „überindividuelle“ Elemente des organisationalen Lernens mit dem individuellen Handeln und intersubjektiven Wissen zu verbinden (z.B. zur Koordination organisationsinterner Zusammenarbeit, Einsatz von Technologien).

Der Unterschied zwischen individuellem und kollektivem Lernen liegt in der Art der Konstruktion von Wirklichkeit bzw. holonistischen Perspektive mit der geschaut wird. Diese bilden sich einerseits aus den Bedürfnissen, Motiven und Werthaltungen einzelner Organisationsmitglieder (I) und ihres Wissen und Handelns (II); andererseits aus der kollektiv geteilten Praxis mit anderen Organisationsmitgliedern (III) und ihres systemischen Funktionszusammenhangs (IV).

Organisationale Wirklichkeitskonstruktionen, also gemeinschaftliche Verständnisse über Geschehnisse innerhalb und außerhalb der Organisation, entstehen nur dann, wenn die Individuen bereit sind, ihre individuellen Konstruktionen, Perspektiven und deren Wissen und Erfahrungen in kollektive Aushandlungs- und Organisationsprozesse einzubringen und damit sich selbst wie anderen ermöglichen, neue Lernerfahrungen zu machen (vgl. Probst/Büchel 1998). Umgekehrt kann es nur eine lernende Organisation geben, wenn die individuellen und gruppenbezogenen Lernprozesse hinreichend berücksichtigt und integriert werden.

Lernen vollzieht sich somit auf den Lernsphären des Individuums wie – auf einer Mesoebene der Gruppe bzw. Teams (Kasl et al. 1997; Imel 1996) und der Organisation (vgl. Crossan/Lane/White 1999). Während auf der Ebene des Individuums über weitgehend unbewusste Intuition (z.B. über Erfahrungen, Bilder) und bewusste, individuelle Interpretation (z.B. über mentale Modelle) gelernt wird, tritt in Gruppen noch gemeinsames Interpretieren und eine Integration (z.B. über Interaktion, Geschichten) hinzu, die wiederum auf der Organisationsebene durch eine Institutionalisierung (z.B. über Routinen, Regeln) erweitert wird. Folgende Übersicht zeigt die verschiedenen Ebenen im Zusammenhang von Niveaus, Prozessen und Inputs/Outputs.

Niveau	**Prozess**	**InPut/OutPut**
Individuum	Intuition	Erfahrungen Bilder Metaphern
	Interpretation	Sprache kognitive Karten Konversation/Dialog
Gruppe	Integration	geteiltes Verstehen wechselseitige Anpassung interaktive Systeme
Organisation	Institutionalisierung	Routinen diagnostische Systeme Regeln und Prozeduren

Abb. 12: Prozesse und Niveauebenen des Lernens in Organisationen (vgl. Crossan/Lane/White 1999, S. 525).

Zwischen diesen Prozessen kann es zu vielfältigen Vor- und Rückbewegungen von neu zu Lernendem und bereits Gelerntem kommen. Ein entsprechender „feedback/forward-Prozess“ lässt neue Ideen und Handlungen vom Individuum zur Gruppe bis hin zum Organisationsniveau fließen. Gleichzeitig kann Gelerntes von der Organisation zur Gruppen oder Einzelebene zurückwirken („Feedback-Prozess“) und dabei das Denken und Handeln der Personen betreffen. Folgende Abbildung zeigt diese Zusammenhänge mit Bezug auf die genannten Lernprozesse.

Diese dynamischen Beziehungen können allerdings eingeschränkt werden. So kann es beispielsweise schwierig sein, ein Lernen, das auf der Organisationsebene institutionalisiert ist, zu verändern. Auch können bestimmte Lernprozesse auf unterschiedlichen Ebenen irrelevant werden sowie Prozesse des „Feedback“ oder „Feedforward“ behindern.

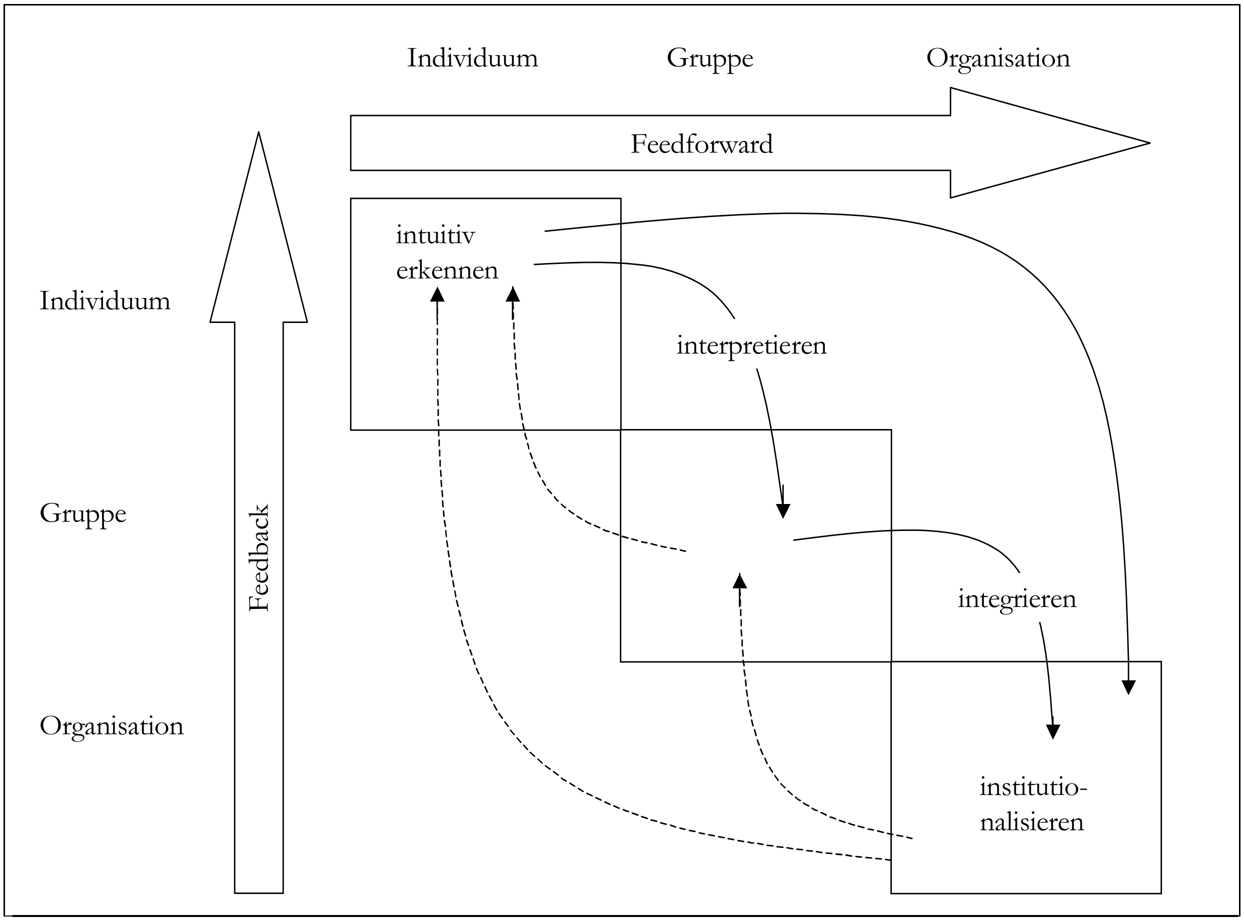

Abb. 13 Organisationales Lernen als dynamischer Prozess (vgl. Crossan et al. 1999, S. 532).

Lernformen und -prozesse

Mit dem zuvor diskutierten Modell kann ein integrales Lernen bestimmt werden, als ein Prozess, bei dem subjektiv-innere und handlungsbezogenen-äussere Dimensionen des Einzelnen verbunden sind bzw. zusammenwirken mit sozio-kulturellen inneren sowie funktional-systemischen äußeren Wirklichkeiten. Nun gilt es dieses Verständnis in Bezug zu bestehenden Lernprozessen zu stellen. Dazu werden zunächst eine einflussreiche Einordnung verschiedener Prozesse des Lernens vorgestellt und dessen höchste Form, die eines reflexiven Meta-Lernen im Verhältnis zu einem transformationalen Lernen und einer Visionslogik diskutiert. Zur Klassifizierung verschiedener Lernzyklen wird von Argyris (vgl. 1976; 1982), in der Nachfolge von Bateson (1972; 1983), zwischen Lernen 1. Ordnung, dem sog. „Einfach-Schleifen-Lernen“ („Single Loop“) und einem Lernen 2. Ordnung. dem sog. „Doppel-Schleifen-Lernen“ („Double Loop“) unterschieden. Dazu tritt, als eine Art Meta-Ebene des Lernens, das sog. „Deutero-Lernen“.

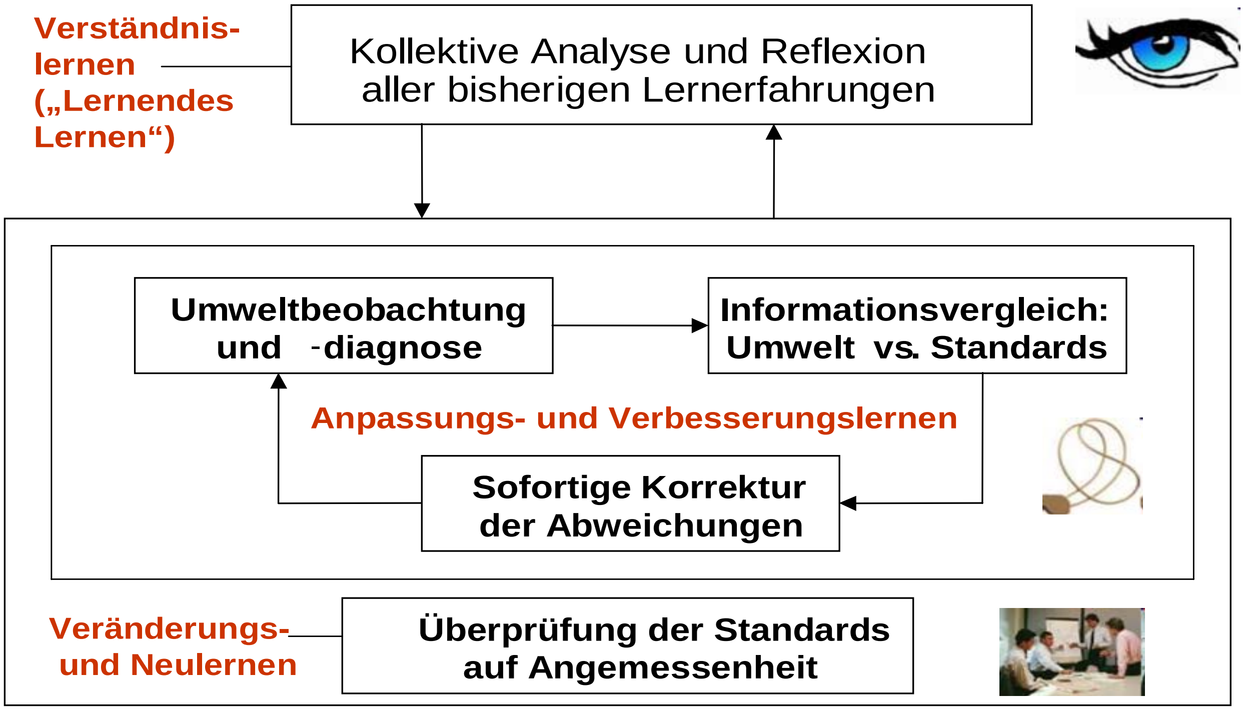
1) *Lernen erster Ordnung („single-loop-learning“)* ist ein Lernen durch Fehlerkorrektur, welches sich innerhalb eines gegebenen Satzes von Regeln bzw. vorhandener Handlungstheorien vollzieht. Es führt zum Wissen, welche Arten von Programmen und Verhaltensweisen in bestimmten Situationen zu welchen Resultaten führen (Anpassungs-

oder Verbesserungslernen). Ein Beispiel wäre ein Qualitätsprüfer, der einen Defekt in einem Produkt entdeckt, diesen den Entwicklern meldet, die dann die Produktspezifikationen ändern, um den Fehler zu beseitigen. Ein single-loop-Lernprozess bleibt damit langfristig auf einem gleichen Entwicklungsniveau. Die Betonung liegt auf “techniques and making techniques more efficient” (Usher/Bryant 1989, S. 87).

2) *Lernen zweiter Ordnung („double-loop-learning“)* zielt statt auf spezifische Aktivitäten oder Verhaltensweisen auf eine fortgesetzte Verbesserung allgemeiner Regeln und Normen, also der verhaltenssteuernden Handlungstheorien selbst. Es impliziert eine Revision von Zielen, Prämissen und Werthaltungen und damit auch Modifikationen oder ein Auswechseln des Bezugsrahmens („reframing“). Dies kann auch mit einem „Verlernen“ überholter Verhaltensregeln oder Muster oder auch Abschaffung etablierter Regeln einhergehen. Als ein „Veränderungslernen“ hat es längerfristig wirksamere Konsequenzen für die Organisation als das bloß anpassungsorientierte Lernen erster Ordnung. Dieses „Veränderungs- oder Neulernen“ kann z. B. dazu führen dass der zuvor beschriebene Qualitätsdefekt nicht nur ausgeglichen, sondern zur Entwicklung einer Zusatzqualität des Produktes oder des Service führt. Oder bezogen auf das Strategiefeld „Markterschließung“ findet ein double-loop-Lernen statt, wenn ein Zulieferunternehmen, das ein innovatives Produkt erfindet, lernt mit eigenen Marketingstrategien zur Vermarktung aufzutreten. Das Doppel-Schleifenlernen ist dann notwendig, wenn Praktiker und die Organisation informierte und reflektierte Entscheidungen für das Design und die Umsetzung von Veränderungsprozessen bzw. zur Überwindung von Ineffizienzen in der Organisation machen wollen.

3) Das *Meta-Lernen („deutero-learning“)* setzt die Kenntnis und Fähigkeit zum Single- und Double-Loop-Learning sowie deren Beeinflussung voraus. Auf dieser Lernebene wird die organisationale Lernfähigkeit selbst zum Gegenstand des Lernprozesses. Dabei wird z. B. der Leitfrage gefolgt: „Ist unser Wissenserwerb und unsere Lernpraxis überhaupt angemessen zur Erreichung unserer Strategien?“. Es fragt also nicht danach, ob „die Dinge richtig getan,” sondern „die richtigen Dingen getan“ werden. Als ein „lernendes Lernen“ analysiert und hinterfragt es die bisherigen Lernvorgänge im Hinblick auf den Lernkontext, das Lernverhalten sowie die Lernerfolge oder -misserfolge (vgl. Bateson 1983, S. 378ff). Mit einem solchen „Verständnislernen“ können lernfördernde bzw. -hemmende Faktoren bestimmt und die Wandlungsfähigkeit sichergestellt werden. Lernen wird somit auch zu einem ständigen Prozess der übereinstimmenden Überprüfung von Organisationsprozessen bzw. -strukturen und äußeren Umfeldeinflüssen. Als höchstentwickelte Form des organisationalen Lernens kann es in einem selbstorganisatorischen Entwicklungsprozess münden, welcher sich rekursiv dieses Lernens bedient.

Folgende Abbildung zeigt die einzelnen Zyklen im Zusammenhang:



Verständnis-lernen („Lernendes Lernen“)
Kollektive Analyse und Reflexion aller bisherigen Lernerfahrungen
Umweltbeobachtung und -diagnose
Informationsvergleich: Umwelt vs. Standards
Anpassungs- und Verbesserungslernen
Sofortige Korrektur der Abweichungen
Veränderungs- und Neulernen
Überprüfung der Standards auf Angemessenheit

Abb. 14: Lernzyklus (in Anlehnung an Argyris 1994, S. 8).

Mit der Selbstreflexion beim Deutero-Lernen wird ein Wissen über vergangene Fehler und Lernprozesse (z.B. aus dem Verbesserungs- und Veränderungslernen) gesammelt, bearbeitet und kommuniziert. Dieses reflektierende Lernen überwindet reines Anpassungs- oder Veränderungslernen, erhöht das Problemlösungspotenzial der Organisation und führt zu grundlegenden Veränderungen der Handlungs- und Kommunikationsmuster überhaupt.

Erst ein solches reflexives Lernen ermöglicht es einer Organisation, nicht nur lernend fortzuschreiten, sondern sich zielgerichtet und lernbereit zu entwickeln und eine generelle organisationale Lernfähigkeit sowie flexible Gestaltungsformen aufzubauen (vgl. Sonntag 1996, S. 69). Während Single-Loop-Lernen nur auf das Handeln und die Aktionsstrategien bzw. -systeme (Quadrant II + IV) zurückwirkt, erreicht das Double-Loop-Lernen auch verhaltenssteuernde Einflussgrößen, insbesondere auch innerlich individuell und

gemeinschaftlich bestimmte Ziele (Qudrant I + III). Doch erst beim Deutero-Lernen als übergreifendes Prozesslernen kommt es zu fundamentaler Reflexion, Analyse und Restrukturierung der leitenden Regeln, Normen sowie des übergreifenden Sinnbezugs selbst, die alle anderen Lernprozesse voraussetzt und inkludiert. Folgende Abbildung zeigt diesen Zusammenhang:

Damit verweist das „lernende Lernen“ (Deutero-Learning) auf eine integrale Lerndimension vertikale Transformation (vgl. Wilber 2001, S. 86). Umfassender als ein translationales Lernen, das eine bestimmte Oberflächenstruktur nur horizontal verändert, verwandelt ein transformationales Lernen auch die Tiefenstruktur (vgl. Fuhr/Gremmler-Fuhr 2005), welches auch neue Formen der holonischen Ebenen und Agenzen emergieren lässt.

Bezug zwischen Deutero-Learning als Meta-Lernpraxis und der Visions-Logik

Als eine Lernform auf einem Metaniveau („second tier“) verweist das Deutero-Learning auf eine integrale Visionslogik. Diese auch als Schau- oder Netzwerklogik bezeichnete Orientierung (vgl. Wilber 2001, 234ff, 319ff) stellt die höchstentwickelte rationale Stufe im Kontinuum der Bewusstseinsentwicklung vom magisch-mythologisch, mythisch-rational bis zum rationalen Denken dar. Wie kann diese Visionslogik verstanden werden?

Indem ich diesen Beitrag schreibe und Sie ihn lesen, verwenden wir in gewisserweise die Schau-Logik. Wir versuchen dabei nicht nur rationale Gewissheit über einzelne Sachverhalte oder Argumente zu gewinnen, sondern sie auch zusammen zu vergegenwärtigen. Damit können wir entscheiden, ob und wie diese sich als eine Vision (von Wahrheit) zusammenfügen. Schau-Logik kann dabei auch mit Widersprüchen umgehen und Gegensätze vereinigen. Als ein nicht-lineares Vermögen, ist es fähig auch scheinbar unvereinbare Dinge oder Themen in einem neuen oder integraleren Holonzusammenhang zu verknüpfen. Während der Verstand, d. h. die Ratio bzw. die formal- operative Intelligenz perspektivisch einseitig, sich spezialisierend, trennend und analysierend ist, integriert die Schau-Logik die verschiedenen Perspektiven, in einer multiperspektivischen synthetischen und interdisziplinären Weise, i. S. einer „integrierenden Vernunft“ (Wilber 1997, S. 331).

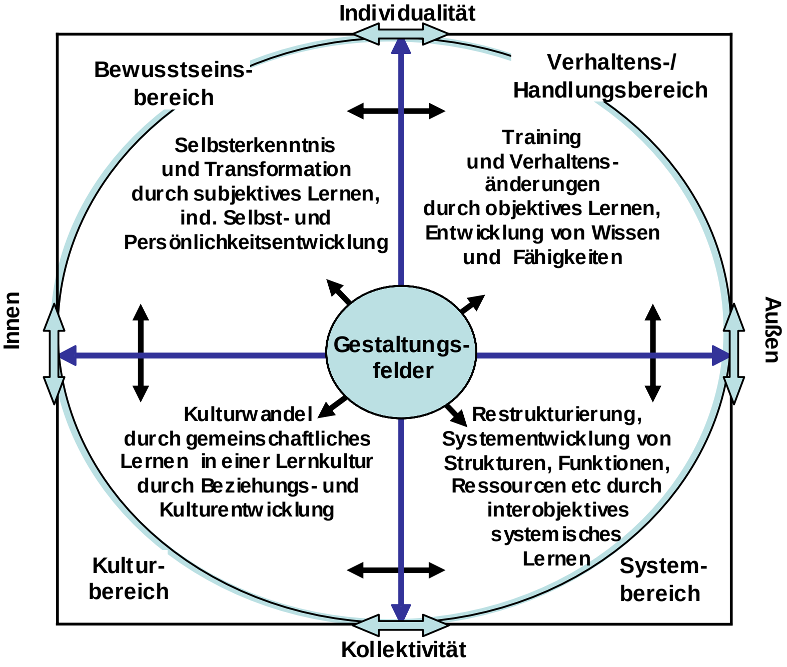
Mit der Schaulogik besteht nach Wilber auch das Potenzial zu globalen Organisationsformen bzw. Kultur zu kommen, die zu noch höheren Formen evolvieren können (vgl. Wilber 2001, S. 235). Die Weltsicht bzw. den Weltraum der Schau-Logik kann als „existenziell“ und „zentaurisch“ bestimmt werden. Der Zentaur ist ein mythisches Fabelwesen, das halb Mensch halb Tier, als Symbol für die Integration von Körper und Geist steht. Die zentraurische Schaulogik vereinigt somit in sich Physiosphäre (Materie), Biosphäre (Körper) und Noosphäre (Geist) als nächster Schritt einer globalen Transformation (vgl. Wilber 2001, S. 322).

Die integrative Kraft der Schaulogik wurde bereits vor Wilber vielfach beschrieben. So hat Jean Gebser eine umfassende Untersuchung zu dem von ihm als „integral-aperspektivisch“ genannten Bewusstseins vorgenommen (vgl. Gebser 1953). Konnte bereits die vorausgehende Stufe rational-perspektivische Orientierung verschiedene Perspektiven einnehmen, vermag erst der integral–aperspektivische Geist alle Perspektiven zusammen zu betrachten und zu integrieren. Dieses aperspektivische Denken der Schaulogik erfasst dabei die holonische Kontextualität integraler Strukturen und Prozesse in einem übergreifenden Zusammenhang. Auch wenn alle Perspektiven zusammenhängen und keine als endgültig gelten kann, führt dies nicht notwendigerweise in einen Relativismus. Vielmehr kann so eine neue Transparenz und die

Möglichkeit von weiterführenden Emergenzen in einer umfassenderen Dimension gewonnen werden.

Die so gewonnene weltzentrische Perspektive wird daher von Gebser (1953) als „universal-integral," „weltoffen“ und „welttransparent“ gesehen. Schaulogik folgt somit einer weltzentrischen Ausrichtung, die ein postkonventionelles Stadium anstrebt, also die Verwirklichung einer rechtlichen, moralischen und politischen Freiheit. Dies ist für all diejenigen zugänglich ist, die willens sind, sich weiterzuentwickeln und bereit sind global zu denken und eine transpersonale Dimension im Verbund mit vorpersonalen und personalen auch kritisch-rationalen Sphären in ihr Leben zu integrieren (vgl. Wilber 2001, S. 320, 321). Ein Einüben und fortwährende Integration der Schaulogik in und durch ein das Lernen kann zu einer solchen integralen Sicht und Praxis in besonderer Weise beitragen.

Integrale Gestaltungsfelder



Individualität
Bewusstseins-bereich
Verhaltens-/ Handlungsbereich
Selbsterkenntnis und Transformation durch subjektives Lernen, ind. Selbst- und Persönlichkeitsentwicklung
Training und Verhaltens-änderungen durch objektives Lernen, Entwicklung von Wissen und Fähigkeiten
Innen
Außen
Gestaltungs-felder
Kulturwandel durch gemeinschaftliches Lernen in einer Lernkultur durch Beziehungs- und Kulturentwicklung
Restrukturierung, Systementwicklung von Strukturen, Funktionen, Ressourcen etc durch interobjektives systemisches Lernen
Kultur-bereich
System-bereich
Kollektivität

Abb.: 16 Beispielhafte Gestaltungsfelder innerhalb der vier Sphären und ihr Zusammenhang.

Die vier Quadranten stellen spezifische Gestaltungsfelder dar, die miteinander abgestimmt werden müssen, um die Entwicklung einer Organisation integral und nachhaltig zu gestalten. Folgende Abbildung zeigt verschiedene Gestaltungsmöglichkeiten in den einzelnen Sphären in ihrem Zusammenhang.

Im Folgenden werden einige beispielhafte Maßnahmen zu den einzelnen Gestaltungsfeldern hier nur kurz aufgelistet:

Zur Förderung von lernunterstützender Selbsterkenntnis und subjektiven Lernens (Sphäre I) dienen z. B.:

- Selbststudium und subjektives Erfahrungslernen (z. B. durch Übungen zur Wahrnehmung, Kontemplation und Meditation).
- Techniken zum Selbstmanagement (z. B. für Umgang mit Lernstress und -schwierigkeiten sowie emotionalen und kognitiven Dissonanzen).
- Reflexion und Weiterentwicklung eigener Wertvorstellungen (z. B. in einem persönlichen Mission Statement oder Lerntagebuch).

Lernrelevante Verhaltensänderung und Entwicklung von Wissen und Fähigkeiten (Sphäre II) können gefördert werden z. B. durch:

- Aus- und Weiterbildung von Wissensinhalten und Kompetenzen (z. B. Erlernen von Lerntechniken, Problem-Lösungsverfahren, Konfliktlösungsfähigkeiten etc.).
- Ermöglichung von Selbstwirksamkeitserleben durch Handeln und Handlungsspielräume.
- Massnahmen der individuellen und handlungspraktischen Personalentwicklung (z. B. Coaching, Trainings on-, off- the-job).

Ein lernspezifischer Kulturwandel und gemeinschaftlichen Lernens (Sphäre III) kann unterstützt werden z. B. durch:

- Förderung von Team- und Gruppenlernen (z. B. durch Gruppenmoderation, Feedback, Intervision etc.).
- Gemeinsame Reflexion und Weiterentwicklung der Werte und Normen der Organisation (z. B. Organisations- bzw. Abteilungsleitsätze).
- Maßnahmen der kollektiven Personal-, Team- und Organisationsentwicklung (z. B. gruppendynamisches Training).
- Aufbau und Entwicklung von Lerngemeinschaften.

Zur Entwicklung einer nachhaltigen Lernkultur ist eine kooperativ-kommunikative (Lern-) Kultur anzustreben (vgl. Kropp 1997, S. 423),

- die nach Ausgleich von Machtverhältnissen und Reduktion von Abhängigkeiten beteiligter Interessengruppen auf der Grundlage von Handlungsspielräumen, Entwicklungsförderung, (Fehler-)Toleranz und Offenheit strebt und dabei.
- verschiedene Einzel- und Kollektivinteressen auf der Basis von Gerechtigkeit, Fairness und Gleichheit, i. S. Gleichwertigkeit anerkennt und konfliktaustragenden Ausgleich anstrebt.
- bei Verhandlungen einem kooperativen Dialogprinzip, d. h. einer verantwortungsvollen Beteiligung möglichst aller Betroffenen folgt.
- versucht eine sinnstiftende und vertrauensorientierte Arbeits- und Lernwelt zu fördern.

Eine Restrukturierung und Systementwicklung der Organisation (Sphäre IV) kann z. B. gefördert werden durch:

- Verbesserung funktionaler Strukturen und Prozesse (z. B. Optimierung des organisationalen Designs der Aufbau und Ablauforganisation sowie von work-flow-Prozessen).
- Massnahmen zu lernförderlichen Wandelprozessen (z. B. Techniken des Change-Managements).
- Funktionales, lernorientiertes Wissensmanagement.
- Einsatz von lernrelevanten Informations- und Kommunikationstechnologien.
- Strategische Ausrichtung und Bewertung von Leistungsprozessen die durch Lernen generiert warden.

Probleme und Grenzen

Um ein integrales Lernen zu verwirklichen, sind mögliche Schwierigkeiten und Probleme zu beachten, die ich hier abschließend anspreche. So können Lernbarrieren (vgl. Schüppel 1996, S. 107ff.) und lernbehindernde Organisationskulturen bzw. -strukturen (vgl. Antal/Rosenbrock 2001) die Entwicklung integraler Lernformen stark einschränken. Zu den Lernhindernisse gehören z. B. die bevorzugte Wahrnehmung von direkten Reizen und kurzfristigen Feedbacks gegenüber indirekten und langsam verlaufenden langfristigen Prozessen oder eine fehlende Verknüpfung von persönlichen Erfahrungen und organisationalem Lernen (vgl. Senge 1996, S. 28f). Neben dem Aufbau von lernunterstützenden Strukturen und Prozessen kommt auch der Vermeidung und dem Abbau von Hemmnissen und Demotivatoren (vgl. Wunderer/Küpers 2002) wachsende Bedeutung zu. Die Etablierung und Wirksamkeit integraler Lernpraktiken kann auch durch „Kurzsichtigkeiten“ des ökonomischen Denkens eingeschränkt werden (vgl. Levinthal/March 1993, S. 101f.). Dazu gehören z.B. die Ignorierung einer langfristigen Perspektive oder des größeren Systemzusammenhangs, in dem sich das Lernen in und von Organisationen vollzieht. Zudem können auch „Lernfallen“ auftreten, die sich durch eine einseitige vergangenheitsorientierte Ausnutzung des Bestehenden (z.B. lerneinschränkendes Festhalten am status quo) oder Ausrichtung nur auf zukunftsgerichtete Entdeckung von Neuem ergeben. Als problematisch können sich auch die Sicherstellung einer organisationsdienlichen Verwendung von erlerntem Wissen und Können und die dauerhafte Aufrechterhaltung von lernpraktischen Anwendungsprozessen erweisen (vgl. Hennemann 1998, S. 207) So besteht die Gefahr das auch „schlechte“ oder für die Organisation schädliche Verhaltensmuster gelernt werden (vgl. Levitt/March 1988). Des Weiteren sind die verbreitete und realitätsferne Vernachlässigung von Machtfragen (vgl. Coopey 1995) und die mikropolitische Dimensionen des Organisationslernens problematisch. Organisationslernen baut auf einer individuell, sozial und systemisch konstruierten Homogenitäten auf (z. B. Begrenzung auf hierarchiekonforme Inhalte) und ist auch daher nicht wertneutral, sondern immer auch ein politischer Prozess. Auch besteht die Gefahr des Missbrauchs der Lernkonzepte zur Erweiterung der Managementkontrolle oder Legitimierung von personalpolitischen Maßnahmen aufgrund fehlender Lernbereitschaft oder -fähigkeit. Des Weiteren kann es nur für eine optimierende Ausnutzung der Mitarbeiter als Human-Ressourcen (vgl. Schneider 1999; Steyaert/Janssens 1999) fungieren, welches nicht die Entwicklung humaner Potenziale zu sehen versteht (vgl. Casse 1994; Kumar Kalra 1997).

Bei vielen Ansätzen des organisationalen Lernens wird auch die Rolle der Top-Führungskräfte überbetont bzw. einseitig privilegiert, was die Vielfalt von anderen Akteuren z.B. im mittleren Management (vgl. Nonaka 1994) oder (informelle) Lerngemeinschaften unterschätzt. Zudem sind die gewandelten Rollen und Aufgaben der Führung hinsichtlich der Förderung der Lernbereitschaft wie -fähigkeit bei den Mitarbeitern zu beachten. Führungskräfte sind demnach Auslöser und Förderer individueller und kollektiver Lernprozesse. Als Trainer, Coach und Berater werden Führungskräfte damit zu Dienstleistern ihrer Mitarbeiter (vgl. Doppler/Lauterburg 1995, Kostka/Krämer 1997), um so zur Entwicklung einer lernenden Organisation beizutragen. Führungskräfte müssen dabei zu “dienenden Führern” werden. (vgl. Kofman/Senge 1995; Spears, 1995). Dabei ist auch das Lernen von Führungskräften selbst (vgl. Burgoyne/Reynolds 1998) sowie ein Lernen von in Praxisgemeinschaften stärker zu berücksichtigen.

Fazit und Perspektive

Ich habe in diesem Beitrag versucht die Bedeutung eines integralen Umgangs mit Wissen und Lernprozessen in Unternehmen darzustellen. Aufbauend auf dem Modell von Ken Wilber wurde das Lernen als Teil-Ganzheit (Holons) mit Bezug zum Organisationskontext beschrieben. Dazu wurde Wilbers holonisches Quadrantenmodell und dynamische Entwicklungslinien auf das Lernen in und von Organisationen angewandt sowie integrale Lerndimensionen diskutiert. Wie deutlich wurde, kann ein Lernen von und in Organisationen kein „Patentrezept“ sein, dass ohne betriebsindividuelle Anpassung eingeführt und verankert werden kann. Damit bleibt eine einfache Generalisierbarkeit und Instrumentalisierbarkeit von Lernkonzepten fraglich und unzureichend (vgl. auch Roehl/Wiegand 1998, S. 21). Jede Organisation muss vielmehr in Abhängigkeit ihrer ganz spezifischen Betriebsgeschichte, Mitarbeitern sowie bestehenden Kultur und externen Sach- und Umwelt ihren eigenen Weg des Lernens und damit des Wandels finden (vgl. Nevis/DiBella/Gould 1995).

Entscheidend für eine lebendige Ausgestaltung eines integralen Lernens und Entwicklung einer „gesunden“ Organisation wird es sein, die Dimensionen, Funktionen, Zwecke und Prozesse sowie Bedeutungen und Implikationen des Lernens auf einer integralen Basis zu gründen. Um diese im Arbeitsleben zu verwirklichen sind auch unterstützende Aktivitäten (vgl. Kriger/Hanson 1999)[2] und integrale Koordination und Evaluation aller Maßnahmen erforderlich.

Anwendungspraktisch wie forschungsbezogen stellt die „In-Beziehung-Setzung“ und Übertragung des Lernens zwischen den verschiedenen Quadranten bzw. deren Sphären eine besondere Herausforderung dar. So gelte es den Zusammenhang von Quadranten und Entwicklungsstufen und –linien des Lernens noch tiefergehend mit einer integralen Methodologie zu untersuchen, gleichmassen die Perspektiven der ersten, zweiten und dritten Person (Singular und Plural) systematisch berücksichtigt Aufschlussreich wäre es auch verschiedene *Typen* des Bewusstseins, z. B. Persönlichkeitslerntypen oder verschiedene geschlechtsspezifische Lernstile auf verschiedenen Entwicklungsebenen vertiefend zu erforschen. Des Weiteren wären leiblich-sinnliche sowie narrative Dimensionen des impliziten Wissens und Lernens im integralen Zusammenhang zu erforschen (vgl. Küpers 2005).

Zu untersuchen wären auch weitere, umfassendere Lernebenen, wie z. B. inter-organisationales Lernen (vgl. Prange 1996) zu berücksichtigen. Dabei vollziehen sich Lernprozesse zwischen einzelnen Organisationseinheiten oder in Netzwerken verbundenen Organisationen. Dazu können bereichsübergreifende Gruppen (z. B. Strategieteams, Projekt- oder Koordinationsgruppen) gebildet werden, die eine „Durchmischung“ und Kombination von Mitarbeitern unterschiedlicher Bereiche bewirken. Damit kann es zur Nutzung von größeren Wissens- und Erfahrungskontexten sowie zu einer Institutionalisierung von Freiräumen für kollektives Lernen kommen, in denen gemeinsam neue Routinen entwickelt werden können (vgl. z. B. Wilkesmann 1999). Noch umfassender sind überbetriebliche Netzwerke bei denen Unternehmen, z. B. zur Entwicklung von Produktions- und Innovationsprozessen, lernend in intensiven Austausch- und Kooperationsbeziehungen mit Kunden und Lieferanten und teilweise auch mit Wettbewerbern und Forschungseinrichtungen stehen (vgl. z. B. Braczyk 1998). Dem schließen sich Horizonte einer Erforschung eines interkulturellen und globalen Lernens von und in Organisationen an (vgl. Brunold 2004).

---

[2] Kriger/Hanson (1999, S. 312) benennen folgende Unterstützungsmassnahmen: 1 Behavior consistent with values, 2 Creating a climate where morality and ethics are truly important, 3 Legitimizing differing viewpoints, values, and beliefs, 4 Developing imagination, inspiration, and mindfulness, 5 Letting go of expectations that are unrealistic, 6 Acknowledgement of the efforts and accomplishments of others, 7 Creating organizational processes that develop the whole person ± not just exploiting current talents and strengths).

Noch immer gibt es zum Konzept des organisationalen Lernens viele offene Fragen und zu wenig Antworten (vgl. Schreyögg/Eberl 1998). Für Praxis und Forschung sind daher weitere Umsetzungsmöglichkeiten und eine vertiefte Reflexion über organisationales Lernen und auch dessen ethischen Grundlagen bzw. Implikationen (vgl. z.B. Snell 2001) notwendig, um die sich real vollziehenden Veränderungen und den damit einhergehenden Wandelprozess zu bewältigen bzw. theoretisch aufzuarbeiten.

Für die Zukunft besteht daher hinsichtlich der weiteren Auseinandersetzung mit Formen eines integralen organisationalen Lernens bzw. integraler lernender Organisation ein hoher Bedarf an interdisziplinärer, theoretische wie empirischer Forschung sowie konkreter Praxisanwendung. Erst dann können deren potenzielle wie faktische Möglichkeiten, aber auch Grenzen systematisch aufgedeckt und praktisch erprobt werden. Das hier vorgestellte Modell bietet dabei ein wichtiges Orientierungsheuristik für die Entwicklung und Praxis eines integralen Lernens von und in Organisationen. In gewisserweise ist eine integrale Praxis in und von Organisationen inhärent lernorientiert. Reife integrale Organisationen sind lernende Institutionen, da Integralität über deren Perspektivierung ein ständiges und umfassendes Lernen auf mehreren Ebenen impliziert. Denn eine integrale Reflexion und integrales Handeln sowie integrale Gemeinschaftsentwicklung und Kommunikation sowie integrale Struktur-, Funktions- bzw. Systementwicklung beinhalten bzw. bewirken fortwährende Lern- und Bildungsprozesse.

Mit einer solchen integralen Lernorientierung und entsprechenden Transformationspraxis wird es möglich, dass lernende Organisationen und ihre Mitglieder zu kreativeren, offeneren und sinnstiftenden Orte bzw. Träger werden, die zu integrierten ganzheitlichen Entwicklungsmöglichkeiten und nachhaltiges Wohlergehen (vgl. Küpers 2005a) beitragen.

Abschließend möchte ich Sie einladen, mit dem vorgestellten Modell selbst zu experimentieren und eigene (Lern-)Erfahrungen damit zu machen und mit anderen zu teilen. Zur konkreten Umsetzung können Sie als Leser in ihrem Umfeld damit anfangen. Sie können sich z. B. fragen, wo und wie Sie für sich in ihren aktuellen Kontext eine integrale Lernpraxis verwirklichen können. In welchen Sphären wünschen Sie sich eine weitere praktische Einübung oder einen vertieften gemeinschaftlichen Erfahrungsaustausch? Wie lernen Sie innerlich und äußerlich und wie kann dieses Lernen verbessert werden? Wie können Sie Ihre Erfahrung für ein integrales Lernen in Ihre konkrete Lebenswelt einbringen oder vorleben? In welcher (Lern-) Kultur leben Sie und wie könnte diese integraler gestaltet werden? Können Sie sich bestehenden Lerngemeinschaften in ihrer Organisation anschließen oder selbst dazu beitragen solche zu entwickeln? Wie gehen Sie mit funktionalen Systembedingungen und -prozesse sowie strukturellen Lernhindernissen um? In welchem Verhältnis stehen die verschiedenen Lernsphären zu- oder gegeneinander? Welche weiteren Fragen, Potenziale aber auch Schwierigkeiten sehen Sie für die praktische Umsetzung und mit wem können Sie sich darüber austauschen?

Ich wünsche Ihnen gutes Gelingen und Freude auf Ihrem Weg eines integralen Lernens und würde mich über Rückmeldung von Ihnen als Chance für ein gemeinsames Lernen freuen.

Integrales Lernen in und von Organisationen
Integral Learning in and of Organizations

Wendelin Kupers

English Summary

Organizational learning has become increasingly vital in today's complex, uncertain, and dynamic business environments. As organizational contexts are increasingly fragmented, equivocal, and constantly changing, learning is seen as a medium for more effective and flexible action. Accordingly, organizational learning has gained academic and practice-oriented currency over the last twenty years as a preferred model for development and management of change.

The current growth of research goes along with a feeling of a lack of clarity, consensus (e.g., Kim, 1993; Crossan et al., 1999) and even growing confusion (Tsang, 1997; Edmondson & Moingeon, 1998). Comprehensive review articles (e.g., Dodgson, 1993; Fiol & Lyles, 1985; Huber, 1991; Levitt & March, 1988; Cohen & Sproul, 1996; Robey et al., 2000) have discussed different aspects of organizational learning and its reinterpretation (Stewart, 2001), being an affirming oxymoron (Weick & Westley 1996) and its various ambivalences (Fenwick, 1995; Coopey, 1995; Steiner, 1998; Küpers 2005).

The purpose of this article is not to provide another comprehensive review of the subject, but to suggest a more integral understanding of the learning process. Often, the complexities of the inter-relational learning processes are ignored, oversimplified or touted as panaceas to be used. It seems that researchers and practitioners do not actually know what a ´Learning Organisation´ "is" or what 'organizational learning' essentially implies (Abernathy, 1999. p. 40). What becomes evident is that the learning organisation will only be a learning one—conceptually as well as practically—when it is not stuck with discussing reifying definitions or mechanistic, systemic or organic modeling of what a learning organisation "is" as an "entity," but to take learning in and of organisations as an relational event and integrative process.

Understanding and enacting learning in organisations demands a comprehensive and integrative framework that is suited to investigating complex, inter-related processes of learning in the context of organisations. For developing such integral understanding of learning within and of organisations, the following article explores how integrative dimensions constitute and influence the learning processes in organizational settings.

Integral theory—as outlined by Ken Wilber—provides an appropriate over-arching approach for such an undertaking. With its perspectives of individual and collective orientations, both in terms of internal and external views, it provides an encompassing meta-theory for approaching the learning process in organisations. Particularly, the four quadrants representing the spheres of an interior-agency or self and consciousness (I), an exterior agency or behaviour as enactment (Me; It), an interior-communal or cultural (We) and an exterior-communal or system (Its) can be applied to such learning. This becomes particular relevant because in many conventional approaches to learning in organisations the exterior and objective perspectives on individual and collective behavior (It, Its) have become the prevailing canon in dominant functionalist approaches.

SOME RIGHTS RESERVED

However, to understand learning as a “four-quadrant affair” requires us to also embrace the left interior dimensions i.e., inner meaning. Conversely, also the inner lives of leaders and the collective spheres of learning need to be seen as co-determined by the behavioral and exterior dimensions. To see the domains only as parallel or to privilege one quadrant over another, is to disturb the delicate integration, co-evolutionary relationality, and interconnectedness of an effective learning practice.

Furthermore, each of the quadrants is marked by a series of different developmental levels or stages and lines of development, which are relevant for understanding learning processes. Again, this dynamic integral embrace corresponds to many reductionistic approaches of organizational learning that often follow only cognitive lines, which explains the prevailing difficulties in integrating embodied tacit knowledge and emotional dimensions and wisdom (Küpers, 2005). Unpacking the significance of “levels and lines” means that a learner can be at a fairly high level of development in some lines (i.e., cognitive), at a medium level of development in other lines (i.e., interpersonal), and at a fairly low level in yet others (i.e., emotional or moral).

With all this, for developing an integral understanding and practice of learning, what is needed is an approach that considers “All Quadrant, All Level, All Lines” (AQAL). This is because it is in all these four domains, level and lines and their interrelations that learning in and of organisations takes place.

Furthermore, quadrants, levels and lines are energized by the dynamics of growth and integration and by what can be called the *“Integral Cycle”* (Edwards, 2005; Cacioppe & Edwards, 2005a,b). This energizing integral cycle is a coherent and dynamic system that co-ordinates the interaction between the four quadrants and the holonic developmental levels and lines. It offers an inclusive model of holarchic involutionary and evolutionary development in particular. With its capacity to analyze, categorize and synthesize the concept of an integral cycle of learning, it is a way of representing the mutual interpenetration of the quadrants, levels and lines and their constituent structures, growth and the dynamic relationships in-between.

The article is organized as follows. After describing the relevance and basic understanding of learning in the context of organisations, a holonic understanding of reality and a brief critique of various reductionisms of learning, different integral dimensions of learning will be outlined. In particular, learning in the spheres of the individual in inner-subjective and exterior-objective learning, a communal learning, and learning within a system on the collective level will be examined. For each of these spheres, features, criteria, problems and their interrelations are outlined.

The relationship between individual and collective learning in and of organisations and different forms and processes of learning will also be discussed. One focus is given to the relation between double loop-learning as a kind of meta-learning and vision-logic cognition as described by Wilber. Afterwards, various practical implications and specific measurements for enhancing integral learning in the different spheres will be discussed. Finally, difficulties and problems will be addressed and in conclusion some perspectives and their implications presented.

As a reminder of our life-world’s multifaceted wholeness and multi-dimensionality, an integrative methodology and orientation related to learning is likely to serve as a helpful antidote to partial views, one-sided approaches and reductionistic “flatland ontologies” (Wilber 2000).

As organizations make the transition to meet today’s challenges, they must consider which aspects of the learners’ consciousness, behaviour and competent action, as well as cultural and system-related issues of learning are being impacted in order to set priorities and enact practices.

With this, an integral approach is an essential presupposition for effective learning process. I hope that this paper presents some ideas for such a comprehensive and integral understanding and practice for learning in and of organisations.

Voegelin's Ladder[1]

Nathan Harter

Abstract: Leadership has non-logical aspects. One of these is spirituality. Voegelin's Ladder provides a context for studying spirituality as a part of leadership. What it reveals is that spirituality arises at the intersection of the human with the divine. Spirituality expresses itself as purpose and aspiration, which a leader embodies.

Key words: Great Chain of Being, leadership, spirituality, Voegelin, Eric.

> "Man is a ladder placed on earth and the top of it touches heaven.
> And all his movements and doings and words leave traces in the upper world."
> - Martin Buber (quoted in Hitt, 1992, p. 3).

Introduction

It is possible to reason about non-logical things. Leadership is one example. Leadership involves non-logical things. Emotion, for example, tends to be thought of as non-logical, yet there has emerged a tremendous interest in something called emotional intelligence. John Gardner once wrote that "in the tasks of leadership, the transactions between leaders and constituents go beyond the rational level to the nonrational and unconscious levels of human functioning" (1990, p. 14).

The literature is full of claims to the effect that leadership involves non-logical things such as passion and desire, as well as mystery, propaganda, and illusion. This would be true in any context, e.g. military, politics, business, and religion. Human beings have feelings, appetites, epiphanies, and tastes, and these can be overwhelming. We should respect them and not dismiss them as residual defects that triumphant Reason will eventually root out or repair. To a large extent, some of these non-logical aspects are the very things that give life savor, meaning, and purpose. Even so, non-logical features can be studied in a logical fashion. That is part of the mission of leadership studies, i.e., to study in a logical fashion the non-logical features of leadership—leadership abstracted from context. To do this, it helps to work within a frame of reference, a schema.

This paper describes a schema developed by the philosopher Eric Voegelin (1974/1990) for depicting a hierarchy, a ladder (if you will) of a range of human aspects. It shows that humanity has its non-logical features, but it also organizes these features in developmental levels, according to a logical structure that can be useful in conceptualizing the persons engaged in leadership—their complete nature as both logical and non-logical beings. With this schema,

---

[1] This paper is an adaptation of chapter 13 from the author's 2006 book on leadership, *Clearings in the Forest* (Purdue University Press) The author thanks his reviewers and the editor of this journal, Jonathan Reams, for their gracious and insightful comments during the review process.

SOME RIGHTS RESERVED

students of leadership can incorporate the non-logical aspects of a person in juxtaposition to the logical, which we shall refer to as rational/analytical thought. In other words, from within one of the levels on the ladder, we will begin to see it all.

Spirituality qualifies as a non-logical feature of human life. Issues of spirituality pertain to that which is at the higher reaches of consciousness. Given the interest by leadership scholars in matters spiritual—and given the confusions that easily arise when trying to discuss them logically—the following paper begins to frame an answer to the question: “What does it mean to speak of higher things?” To get there, we must adopt a mental model distinguishing the upper from the lower. Voegelin’s ladder does just that.

A word of caution is immediately necessary. Rational/analytical thought, as we are calling it, cannot completely fathom reality. Certain aspects of life are impervious to its scrutiny. “The heart,” wrote Pascal, “has its reasons that Reason does not know.” Freud, for example, studied hidden non-rational drives in the psyche. LeBon studied non-rational drives in the mob. Edmund Burke referred to sentiment, Kierkegaard, to faith, and Schopenhauer, to the will. Reason has its place, but it quickly finds itself subordinated or set aside in actual experience, and even though most people believe it is worthwhile to apply reason to non-logical things for purposes of study, reason can never thoroughly grasp or contain it. As Ken Wilber was to put it, relying on Kant and Nagarjuna, rational arguments attempt “to use the eye of mind to see that which can be seen only with the eye of contemplation” (1998, p. 21).

It takes an integrated vision of human nature to depict for rational/analytical thought that requires the eye of contemplation. Kenneth Boulding (1956) suggested a handy way of understanding this. There is what he called an image we use to operate in the world. Part of it is conscious, the part we pay attention to, like the part of a building that shows up at night in flashlight. Part of it is unconscious, the part we could pay attention to, if we choose to do so, like the parts of a building that are presently dark to us, but which we could see if only we move the flashlight. The third part of the image is subconscious, a part we cannot pay attention to, like the parts of a building behind the façade, where the flashlight cannot penetrate. All three parts affect behavior (p. 54). The trick is discerning what lies behind the façade. Boulding believed that the rest must be left to inference.

Are the things behind the façade all the same? Are all non-logical features of leadership alike? They are largely opaque to us, behind the façade and easy to cluster together in our imagination. Should we refer to all of it as the subconscious? Henri de Lubac (1944/1949) complained, “How often the supraconsciousness is confused with the infraconsciousness!” (p. 383). Supraconsciousness and infraconsciousness make a fine and volatile distinction. There are in a sense two types of things behind the façade: similar in being non-logical, but otherwise at opposite ends of a spectrum or ladder. Voegelin’s ladder depicts something at the higher reaches of consciousness and something at the lower reaches of consciousness, at the fringe or twilight of ordinary human consciousness, and both are non-logical aspects of human behavior.

In order to portray Voegelin’s ladder, we make two immediate distinctions. First, we distinguish the façade from that which lies behind the façade. Second, we distinguish what lies behind the façade between supraconsciousness and infraconsciousness.

Below and above

An integrated vision of human nature will capture non-logical aspects of those who engage in leadership. Not everything that is non-logical is the same. Voegelin’s ladder attempts to differentiate these aspects vertically, with categories below rational/analytical thought as well as above. At the lower reaches of consciousness would be things that we normally call material, biological, lower needs and drives, such as instincts, appetites, the will to power, and so forth. Writers who emphasize these non-logical things (e.g. Freud, LeBon, Burke, Kierkegaard, Schopenhauer) are trying to explain the foundations of phenomena such as leadership. Why do those we refer to as leaders feel compelled to lead to begin with and why do those we refer to as followers respond?

How far back into the material stuff will the explanation go? We might talk about impulses or urges. We might examine the psychological effects of a leader's height, health, resonant voice, posture, alpha animal traits signaling a primate coping-mechanism for the community, and so forth. The hypothesis is that humans tend to lead and follow in response to sub-rational forces, such as fear or fascination. Curious students can go back of psychology to genetics, evolutionary biology, chemistry even, I suppose, and electricity. This "downward" path looks at leadership as an outward phenomenon of a deep, organic process attributable ultimately to the impulses of vitality. The search is for causal explanations at the most basic level.

A distinct variation of this path is the power of myth. Writers on leadership such as Bruce Mazlish (1990), James Hillman (1995), and C.F. Alford (1994) have treated this variation with dexterity and depth. From within this variation come works on soul, which is different from spirit. In simplistic terms: soul is lower than spirit, a repository of myth and archetype, further below even rational/analytical thought, though higher than our vegetative and inorganic natures (see e.g., Wilber, 1998, pp. 162-166; Wilber, 2000, pp. 193-197).

As students entering the investigation from the rational/analytical level, we can describe a vertical line, with paths going up and down, in both directions. The first path, the one we have already started to describe (which de Lubac labeled "infraconsciousness") probes downward, toward the material foundations of human behavior. The second path goes in the opposite direction. With de Lubac, we can call this path supraconsciousness, and it includes things we normally understand as aesthetic, moral, if not religious. It refers to a higher calling, a larger purpose, things such as destiny and vision, as though humans are beings with free will who aspire to something above or beyond themselves. Writers who emphasize these non-logical things are trying to explain the way that humans set goals and dream dreams. What are folks wanting to achieve? What do they hope to gain? Are we all part of something beyond our daily survival? Is there something more? This second path, traveling up our vertical line, looks at leadership as the means for fulfilling some cluster of aspirations. It is in a word teleological.

The characterization of one path going down while the other path goes up connotes superiority, a hierarchy, as though going up were nobler, more elevated than the other. Our language is full of similar metaphors equating "up" with "better." It would be unnecessary to accept that connotation. James Hillman has written extensively on behalf of going down—not toward the material specifically, such as organic chemistry, but toward myth and the soul (see e.g., Hillman, 1975). Down is good, too. That is why it might seem more acceptable to speak of going *deeper*. That has a different connotation.

We must be careful, because the point of Voegelin's ladder is to examine what lies beyond the vantage point of rational/analytical thought, for purposes of study, and not to regress completely to the lower levels, renouncing what lies above.

Studies of leadership that move downward are perfectly legitimate. They form part of a complete treatment of the subject. We all have much to learn from the study of infraconsciousness. There is a non-logical foundation to human behavior. It is out of that foundation that humans emerge as they are. A thorough understanding of it can only help the cause. To highlight one example, Bernard Bass reports that several studies indicate leaders possess higher energy levels than non-leaders. Energy is an infraconscious factor that appears to be relevant to leadership (1990, pp. 89-90).[2]

It is our purpose in this paper to move in the other direction, upward, toward the spiritual—not to repudiate what lies below, but rather to seek to understand what seems to lie above. It too is comprised of the non-logical, and it too (in my opinion) can be studied rationally…up to a point. Chester Bowling, to cite one example, refers to a "nonrational epistemology" about leadership because the spirit lies in the "noncognitive realm" (2001, p. 370). How then do we show that realm?

Voegelin's ladder

The image of a vertical line to order our thinking in this way received an explanation in a little known essay by Eric Voegelin. In the *Southern Review* (1974), he published "Reason: The Classic Experience." His article included an appendix, where he set out a table to show what he called "levels in the hierarchy of being" (1974/1990, p. 290).

Table 1. Voegelin's Ladder

	Person	Society	History
Divine Nous	↑		
Psyche Noetic			
Psyche Passions			
Animal nature			
Vegetative nature			
Inorganic nature			
↓ Apeiron -- Depth			

Reprinted from *The Collected Works of Eric Voegelin, Volume 12: Published Essays 1966-1985* by Eric Voegelin, by permission of the University of Missouri Press. Copyright © 1990 by the Curators of the University of Missouri.

In Voegelin's words:

> The arrow pointing down indicates the order of formation from the top down. The arrow pointing up indicates the order of foundation from the bottom up…. The order of formation and foundation must not be inverted or otherwise distorted…. (*Id.*, p. 290)

According to his principle of completeness, we must understand and appreciate each of the levels and not isolate any one of them. The ladder goes a long way toward illustrating what it would mean to have a comprehensive understanding of leadership: all of the cells on the ladder would be filled. Doing so would purportedly connect everything together. He saw no advantage in reductionist models.

---

[2] No one can ignore the material factors of leadership, whatever the context. In reference to Napoleon III, Bass has quoted Emile Zola: "A grain of sand in a man's flesh and empires totter and fall." (1990, p. 155) Bass then considered the effects of ill-health on leaders at the onset of World War I, plus specific crises in the American presidency attributable to physiological conditions. Later, he foresaw the importance to leadership studies of breakthrough findings in genetics (1990, p. 911).

Human beings operate at all levels simultaneously; these are simply different ways to approach the same reality.[3] In other words, we are at one and the same moment physical objects operating according to physical laws—inorganic, vegetative, and animal—as well as psychological creatures with passions, beliefs, and imaginations (*Id*., p. 268). Voegelin insists on humanity's participation in the complete hierarchy of being and refers to it as our "integral nature" (*Ibid*). We fully occupy a reality between the two poles of transcendence at the top and the *apeiron* at the bottom. The temptation to pick one level and insist that it must be the *only* level he calls "hypostasis." It is a reductionist fallacy—unnecessary, for one thing, and unresponsive to the evidence (*Id*., p. 290; Harvey, 2001, p. 378; see Wilber, 1998, pp. 38 & 56f). As the Spanish philosopher once wrote: "The sole false perspective is that which claims to be the only one there is" (Ortega, 1923/1961, p. 92).

Not everyone agrees with this position. There are writers who do choose one level, one way of understanding, and declare the rest to be illusory. "Language of 'higher things' rationalizes behavior," they might argue, "cloaking it in legitimating words, almost to the point of deceit." They hold that claims of spirituality in leadership are little more than a pious fraud. Borrowing from Karl Marx, John Dirks refers to this as the opiate hypothesis, which holds that "spirituality of work represents a corporate attempt to mollify workers into accepting and cooperating with essentially oppressive and exploitative work conditions" (2000, p. 2; see also p. 6).

For purposes of illustrating hypostasis further, Jacques Barzun mentions an 18th century book titled *Man as Machine*, followed in the next century by the declaration of man as an automaton. Since then, he writes, "man has been portrayed as a chemical, glandular, and electrical machine, [even] predestined and worked by the instrumentality of cells and genes." (2000, p. 367) Christian apologist Francis Schaeffer famously attacked this line of thinking in *Back to Freedom and Dignity* (1972/1982).

Voegelin's ladder makes room for many "viewpoints" so long as no one view presumes to exclude the rest. It allows for the possibility that leadership, as a phenomenon in reality, can be studied profitably at any one of the levels, from multiple perspectives.

Leadership < > Spirituality

At the pinnacle of Voegelin's ladder we would find that level where we can start to make sense of spirituality. This highest level implicates or refers to something even higher, beyond which we cannot go, transcending humanity. The highest level represents the point where humanity intersects with the divine. For that reason, it will have to remain incomplete, tinged with mystery, allusive.

Despite its inscrutability, we have to take spirituality seriously and do our best to understand it, for several reasons (see generally, Harter, 2004).

---

[3] Ken Wilber uses the imagery of a ladder to illustrate a progression, which is not incompatible with Voegelin's purpose inasmuch as Voegelin speaks from a higher rung on the ladder that includes everything that came before. His is a static model, not a dynamic model. For Voegelin, the perspective embracing all of the levels simultaneously matches the highest levels in Wilber's ladder of consciousness. For a discussion of the ladder as a progression, see Wilber, 2000, chap. 9.

a) There has been a revival of interest in spirituality among academics in management, organizational behavior, and leadership studies, so we have to take some account of their work.
b) Academics have become increasingly interested largely because spirituality has been invoked by leaders and followers as meaningful, if not determinative, for their experiences of leadership (Cavanaugh & Bandsuch, 2002; Harvey, 2001; Mitroff & Denton, 1999).
c) Leaders and scholars alike have examined the possibility that spirituality has instrumental value (Mitroff & Denton, 1999, p. 86). Corinne McLaughlin assembled multiple findings, concluding that "[s]pirituality could be the ultimate competitive advantage" (2002, citing Mitroff).
d) It is not just a competitive advantage. Spirituality pertains to morality and ethics. (Marsden, 1997, p. 85; see generally MacIntyre, 1981/1984) Debates and investigations into the origins and validity of moral claims frequently refer to spirituality. Cavanaugh & Bandsuch (2002) even argue that virtue should be the benchmark for spirituality in business.
e) At the very least, claims of spirituality deserve as much respect as other diverse claims in a pluralistic society (Marsden, p. 86). It will not do to bar them at the gate.

What people are saying…

Spirituality is hard to define. Different traditions offer versions. Frequently, people who claim to experience the spirit simply refuse to give more than a vague description, saying that such things are ineffable. They are, in the words of Ken Wilber, "attempting to use the eye of mind to see that which can be seen only with the eye of contemplation" (1998, p. 21). What does he mean by that?

As a practical matter, how does a person discern various levels on the ladder? Wilber finds a corresponding "mode of knowing" for each of the three dominant levels of matter, mind, and spirit, which he refers to as the eye of flesh, the eye of mind, and the eye of contemplation (1998, p. 18). Thus, if we want to know anything, we must use the appropriate mode of knowing (*Id*., p. 155ff). To understand the spiritual dimension of leadership, therefore, we must use what he calls the eye of contemplation, which can be difficult. Specifically with regard to leadership, however, a number of writers have made the attempt, directly or indirectly.

In other words, leadership studies already includes attempts to connect leadership with spirituality, even though these writers do not explicitly place their attempts within a schema like Voegelin's. Without knowing it, they have been searching the higher reaches of Voegelin's ladder to illuminate or explain leadership behavior.

We might justifiably imitate Aristotle, who in similar situations would look around to find what people are already saying about a topic. For the sake of brevity, I restrict myself here to a few writers. Their remarks do not actually *prove* the importance of this non-logical, supraconscious realm, but they do illustrate a widespread belief in its importance among people who have spent considerable time reflecting on leadership.

The reader might notice in these remarks a tendency of the writers to speak of leaders in isolation from their relationships, following the model of leadership in which individuals influence others toward desired goals and objectives. Leadership was about the leader—his traits, behaviors, and styles. For a long time this has been a conventional way to talk about leadership.

A number of critics have since disparaged such "great man" approaches to the study of leadership, challenging the assumption that when studying leadership we can meaningfully study only the leader (e.g., Lee, 1991/1993). Nevertheless, the following writers did work within that tradition. For this reason and for reasons cited elsewhere, so shall I (Harter, 2003).

Many of these authors refer to the leader's "higher" purpose. The leader is not to be merely utilitarian, using or deploying followers in order to achieve results. Rather, a leader answers to a higher calling, grounded in something sublime, transcendent, or holy, and it is that fealty, that dedication which positions her to lead others. What exactly are they saying when they say things like this?

In what follows, the authors do not always use the explicit language of spirituality, and that is my point. They *implicate* spirituality.

Certain Christians writers can be seen to urge the connection of leadership with spirituality. They are usually explicit. John Maxwell has made a career in the Christian publishing industry by beginning with scriptural precepts and drawing conclusions about what leadership is (or ought to be). Let it not go unsaid in this place that much of the literature is unapologetically anti-intellectual, grounded in fundamentalist dogma—which does not mean that it is necessarily wrong or useless. Among intellectuals from within the Christian tradition, Irving Babbitt and Richard Weaver made similar claims about leadership, and their voices have been too long neglected in leadership studies (Panichas, 1996/1999, chap. 5). Nevertheless, Christianity is not the sole basis for connecting spirituality and leadership.

Not all of the persons writing about spirituality have a religious perspective. Some are simply groping for words that intend much the same thing as spirituality. Their work is secular. Peter Koestenbaum sets out in his book on *Leadership: The Inner Side of Greatness* to show that by pursuing greatness we "ennoble human nature and strengthen our societies" (1991, p. xi). Toward that end, leaders engage in transcending (even mystical) visions at a higher level perspective (*Id*., chap. 5). Kouzes and Posner use comparable language. They urge leaders to be forward-looking and inspiring. "If a leader displays no passion for a cause, why should others?" (1987, p. 21). Thus, by describing a lofty vision, leaders "ennoble those who work on its behalf [and] elevate the human spirit" (*Id*., p. 117). James MacGregor Burns describes transforming leadership as raising leader and follower "to higher levels of motivation and morality" because followers are to be lifted or elevated into their better selves (Burns, 1978, pp. 20, 41-46). Peter Vaill considers spirituality to be a requisite of visionary leadership, such that "all true leadership is indeed spiritual leadership" (1989, p. 223).

Charles Handy insists that "life is about more than surviving—there could be something glorious about it, it could contribute to a better world. That leaves one with a personal challenge, to do something glorious with one's life. It is also, I believe, a challenge for every organization and every business" (1998, p. 118). In addition to these voices are books on spirituality reviewed recently in *The Leadership Quarterly* (2001). Let us take a closer look at what all of these writers are claiming.

In the next section, this paper will attempt a synthesis, rarely attributing specific claims to specific sources. This is my attempt to combine the many loose associations of leadership with spirituality to which this paper has just alluded into a more coherent treatment, so that we reach an answer to the question raised earlier, namely "what does it mean to speak of higher things?"

Leadership *implies* spirituality

Leadership, like spirituality, is a relationship grounded in a purpose, and that purpose reflects the aspirational character of its participants. Participants experience and respond to the tension of existence. Leadership originates in a desire to change the present, to improve something about one's existence and bring it into alignment with an ideal, no matter how slight. Leadership embodies those aspirations, representing a level of faith we have as humans that together we can participate in approximating those ideals. Aspiration justifies leadership.

Humans obviously aspire. They envision a future that is different, better somehow, from the one they presently occupy. They believe things can get better. And rather than sit around hoping for that to happen on its own accord, like manna from heaven, humans tend to get up and do something about it. They participate in trying to improve the world. This drive to realize better days takes shape, moving from need to idea to purpose, and then humans get down to work. To the extent they work together toward some common purpose, issues of leadership become comprehensible. The very existence of common or collective purpose makes leadership possible. According to Mary Parker Follett, common purpose is what makes leadership intelligible (1919).

This purpose—whatever it is—belongs to the spiritual realm, no matter how mundane. It might not be so overtly religious as praising one's God or winning salvation for the soul, but it belongs to the spiritual realm regardless. Within that spiritual realm of dreams, desires, designs, and decisions, we may try to make a profit, assault an enemy ridge, or pass legislation. It could be any one of a number of objectives. Spirituality does not have to be restricted to lofty or vague ideals.

The question arises whether all human aspiration derives from the realm of spirit. To the extent that spirit infuses all things down through the ladder, then the answer would be "yes"—but it is important to recognize that the aspirations at the lowest levels will seem unremarkable, if not crass. To say that feeding the body and taking a nap reflect our spiritual being stretches the ordinary meaning of "spiritual." We could as easily ascribe these aspirations to the level immediately above, such that the animal nature shapes the vegetative, and the emotional shapes the animal, and the rational/analytical shapes the emotional, and so on, with the spiritual font becoming increasingly apparent and unfiltered the higher one goes.

Another question arises about aspirations we would declare to be unethical or evil. Could it be spiritual to desire the extermination of a rival clan, for example, or the assassination of its leader? Superficially, to the perpetrator the choices might seem praiseworthy and, yes, spiritual, resulting in fame, apotheosis, and an eternal reward of bliss. Nazi prison commandants, suicide bombers, and Hutus wielding machetes all might have considered themselves fulfilling some high purpose. Most of us today would not be satisfied with that assessment, which is why I would characterize their condition as a spiritual disease—a term coined by F.W.J. Schelling and elaborated by Voegelin elsewhere.[4]

With this in mind, one long term project for a pragmatic leader, it seems to me, would be sorting through these various aspirations, reconciling most, rejecting some, and prioritizing them into some kind of coherence. That coherence ultimately fits into the coordinates of two classic questions of self-awareness: (a) who am I? And (b) why am I here? All purposeful action presumes to derive from how we are oriented with regard to identity and vocation. Consequently, so too would leadership presume to answer those questions, for both the leader and the followers.

---

[4] On the origin of the term "pneumopathology," see Day, 2003, pp. 11-12. See also Voegelin, 1990, pp. 278ff. The topic of pneumopathology however exceeds the scope of this paper.

Max Scheler, writing extensively on spirit, regarded it completely as "guidance and direction" (1928/1961, pp. 62 & 68). Spirit sublimates drives or instinct by detaching a person momentarily from the immediate press of events (dictated by the infraconsciousness and its encounters with the world) to contemplate another way, another possible condition, which it then pursues by channeling energy. Spirit inspires leaders to realize a vision and permits them to inspire followers to do the same. In this way, leaders experience spirit within themselves and evoke spirit in others.

Suppose that a leader articulates a vision about the kind of shipping department she expects to be supervising at a manufacturing facility. That is her purpose. She is painting a verbal picture of the future she wants to bring about, and she is trying to get her subordinates in the shipping department to share that vision, to buy in to it, so that together they can work to make it a reality. That is the typical kind of aspiration in leadership studies—worldly, narrow, common. No one disputes that some leaders articulate more elevated visions, such as world peace and eternal bliss, so the point I am trying to make is that they are in essence the same thing. It does not really matter how lofty the goal. The supervisor has taken a piece of the whole vision for a better world (where everyone profits and workers go home proud of their labors, while customers experience delight) and has applied that to a specific set of circumstances, for a specific set of people and a specific task. Her vision is part of a larger vision. And that's okay.

The literature on leadership and spirituality appears to be asking leaders and the scholarly community to take seriously the spiritual dimension of even the most mundane projects, to contemplate the way in which a leader's immediate vision fits a larger vision. "Are you building a cathedral or just cutting stone?"

That is what I understand the literature to intend.

A prescription

Voegelin's ladder depicts a hierarchy in which higher levels form the lower ones. Lower levels constrain what the higher levels can do. And as the levels get higher on the chart, levels that are *relatively* lower actually resist formation and (in a manner of speaking) push back. Animal appetites frequently crowd aside rational thought, as Maslow rightly understood; rational thought has for its part been clever stigmatizing spirituality as delusion or superstition. What lies below resists what lies above. Part of what this journal intends, as I understand it, is the restoration of hierarchy (or in the vocabulary of Wilber "holarchy"), as a matter of prescription, reestablishing the rank order, so that first and foremost a leader is attuned to her purpose, subordinating her powers to that purpose, with each descending level forming the levels that fall below it. To do that, she must be aware of the constraints placed upon her ambitions by these lower levels. Aspiration that is oblivious to real world constraints is un-realistic, overweening (we might say), at risk of becoming utopian, oppressive, even stupid.

Just as the stone resists shaping, requiring the violence of the chisel or the abrasion of corundum in order to embody the sculptor's image for it, so also throughout the hierarchy will lower levels resist the higher. For this reason do we have to remind ourselves that "the spirit is willing, but the flesh is weak." To the extent that the spiritual purpose of leadership influences followers, it must bring them into alignment or confluence, overcoming resistance by cascading from above, from aspiration down to rational/analytical thought, down to the passions, through the animal nature. Leadership that neglects this work will struggle, if not fail, as followers yield here and there to their own weaknesses and generally drift away from the task at hand. In shades of Douglas MacGregor's Theory X, leadership would be the shaping or ordering of these levels (in oneself and in others) toward achieving a purpose—a discipline, if you will.

Leaders sometimes neglect this work and lose sufficient mass. In this sense, their leadership seems airy, detached, and ultimately fantastic. Reality gets away from them, and their vision reveals itself to be nothing more than a dream. By way of contrast, leaders sometimes undertake this work of trying to shape lower levels to make them conform without respecting inherent limitations, driving folks to exhaustion, abusing their trust, and creating warps, monstrosities. A Khmer Rouge, to cite one tragic example, devoted extraordinary resources to imposing widespread equality and uniformity.

Both the ineffectual utopian and the cruel slave driver share this in common: they do not take seriously the reality of their situation and work with it.

It is true that people in their personal lives usually fail to hold this hierarchy together in good order, knowingly or not, which is one reason they respond to leaders who do. Voegelin's ladder is almost a template for patterns of domination, as persons operating from a higher level are more likely to lead. I would not push the analogy too far. It does however tend to reinforce the claim that people are likely to follow leaders with integrity, where integrity means the *integration* of the entire person, up and down the ladder. And, ordering the whole thing—transcending and including the rest—is the spirit, a force and criterion of order (Voegelin, 1974/1990, p. 265).

Students of leadership would be advised for the sake of thoroughness to consider the role of spirituality in leadership. Voegelin's ladder assists in that project.

Summary

We are human beings trying to understand human behavior. At some point in our ruminations, we are obliged to make plain our anthropological framework. *What does it mean to be human?*

Scholars are inclined to value rationality, and they should. Scholars themselves tend to be very smart, and as scholars they tend to be rewarded for their intelligence, so they come to rely heavily on their intellectual powers—their rational/analytical powers. Rationality lies at the heart of their work. To complement this, in academic settings I must make controversies surrounding the limits of this kind of reason explicit.

Another reason to make these controversies explicit is the methodological assumption behind many investigations in rational choice and game theory that participants in social interactions are thoroughly rational. This is an assumption—a useful assumption, in many instances—but an assumption, nevertheless, which we would do well on occasion to doubt, in deference to the empirical evidence that leadership is just as largely non-logical, if not more so.

These controversies gave me an excuse in this paper to make plain one anthropological framework, namely Voegelin's ladder, which presents a broad and variegated image of humanity. This framework not only assists in the study of leadership, as for example in classifying previous research, it also suggests a way of structuring prescriptions for leadership. Studies and advice that take a more integrated view of humanity are more closely aligned with experience.

Promptings of the spirit form aspirations, which take shape in the mind of a leader as purpose that will depend on rational/analytical thought to design and then execute a plan in light of existing constraints. Spirituality informs ethics, which in turn relies on our intellectual powers to prepare a response to the demands of a paramount reality. To the extent we are going to teach others how to lead, therefore, we should in my opinion ground their ambition in their life's vocation and equip them intellectually to integrate their whole life and their circumstances as a precondition for their attempts to lead. Otherwise, leadership is little more than messing in the lives of those who have their own callings and dreams.

More Perspectives, New Politics, New Life: How a Small Group Used *The Integral Process For Working On Complex Issues*

Sara Ross

Abstract: This article reports on a small research project with citizens who wanted to address their community's chronically adversarial behaviors and atmosphere. It complements a longer research report on the same project, which is also published in this issue of *Integral Review.* The project used a structured public discourse process, The Integral Process For Working On Complex Issues (TIP). This article supplies background on TIP's origins, then focuses on two areas. First, it explains the process steps used in the project in conjunction with the issue that participants developed by using them. Second, using examples from participants' experiences of transformative impacts from their work in the project, it reports on two themes that underlie the main impacts and outcomes. The group worked on an issue about how its own intentions and tones needed to be chosen carefully if participants wanted to improve the adversarial local culture. The article includes links to "products" the group created in the course of its work. The themes were about dissolving "us versus them" mindsets and behaviors, and the liberation of being able to use multiple perspectives (as compared to only one point of view). This article is aimed at a diverse audience of individuals and organizations interested in promoting healthy individual and social change by addressing complex public issues and relationships. A brief epilogue sketches how TIP embeds criteria of integral theory.

Key words: action inquiry, complex issues, deliberation, decision-making, group process, political culture, public discourse, public relationships, replicable, The Integral Process For Working On Complex Issues, transformative.

Introduction

When a small group of citizens used a structured public issues discourse process to identify and begin to address a local issue of concern, the outcomes were productive, hopeful and even transformative. As a small group of volunteers in a research project, they chose to dig into their concerns about the adversarial climate of the local community, using "The Integral Process For Working On Complex Issues" (TIP).[1] During and after the six-week project, they experienced significant insights into the issue. These insights and the outcomes of their work had valuable implications for the community's future. They also had meaningful and in some cases transformative impacts on other areas of participants' lives. This article highlights the main steps involved in launching work on a complex issue by discussing this specific case. Because the

SOME RIGHTS RESERVED

steps are replicable, I hope to indicate how they apply to a broad range of other issues and contexts in addition to those in this case example.

Audiences that might have a practical interest in what happened during this project may include citizens and citizen-activists, public officials, public agencies, non-profit organizations, and foundations with missions to address public issues and/or public relationships. Practitioners and consultants in the fields of deliberative democracy, group dialogue, conflict resolution, and public policy may also find it of value.

As an introduction to the project and some of its findings, this article focuses on the TIP steps the group used, and how those steps enabled participants to select an issue of their choice and work on it productively. That work took place within the context of a small research project I conducted. Although this public issues version of TIP is designed for community-wide use, the project had limited research goals that did not include community-wide implementation. They were to: (a) find out what changes, if any, participants experienced that could be associated with their participation in this structured public issue process; (b) learn about the issue that participants would select, analyze, develop, and deliberate during the project; and (c) study what happened within the culture of the small group of participants. This article complements my longer qualitative research report,[2] which does not discuss the process and methods in detail.

To tell the project's story, I begin with some background information on the experiences and observations that led me to develop this process for working on public issues. Then I introduce three of the project's dimensions. One of those is the set of process steps and their purposes, to show how they function in complex issues work. Another is the local issue that participants selected to work on, concerning their community's adversarial political culture. These first two dimensions intertwine, so I discuss them together. Those foundations need to be set before I, thirdly, introduce two of the major themes in the transformative impacts that participants reported. In the conclusion, I briefly summarize the project outcomes and suggest some of the implications of the project that may be relevant to this article's audience.

An Introduction to the Process

This section provides some brief historical background on TIP and my motivations for having developed it. About 20 years ago, I was at a stage in my life when I could begin to invest energy in my local county's civic affairs and issues. The most fascinating and troublesome feature I observed was that the same knotty issues and concerns were talked about year after year, even from one decade to another. As is true everywhere, different issues concerned certain populations more than they concerned others, and the large range of issues was much the same as people throughout the U.S. and other Western countries talk about. Some of those issues were localized concerns, some were regional, and some were at state and national levels. People who were talking about these issues included citizens on the street, those who participated in ongoing community leadership programs, local officials in villages, townships, and county offices, social service agencies, and active members of the business community. Despite all the talk, virtually nothing happened to address those perennial concerns. I did a lot of listening to the *nature* of that talk as well as the issues. I began to analyze what was going on and why, imagined what needed to be different to shift the chronic inertia, and experimented with my early ideas.

---

[2] A more comprehensive research report is included in this issue of Integral Review, entitled *Perspectives On Troubled Interactions: What Happened When A Small Group Began To Address Its Community's Adversarial Political Culture*. That report includes traditional research elements of literature review, theory, methodology, etc. This qualitative research with human subjects used an informed consent process and obtained signed, informed consent forms from each participant. It gathered data through the six weekly sessions as well as individual interviews with the participants both before and after that series of sessions. The project took place in a small city in Ohio. The eight participants ranged in age from 31 to 57 years and had a wide variety of educational backgrounds.

When I spent a number of years associated with Kettering Foundation as an independent action researcher, I learned that people in communities around the U.S. were talking about their issues and concerns in ways that were similar to communities in my county. I estimate that I have worked with and listened to more than a thousand citizens over all of these years, and the same patterns have shown up across all the talk about public issues. When my association with the Foundation began in the early 1990s, some of its folks were in the early stages of sharing how they helped people talk about issues. They had found that it was important to “name and frame” public issues so that citizens could deliberate about public policy concerns and other “wicked problems.” Concurrent with ongoing volunteer work in my local area, I did both short- and long-term action research and extended workshops with groups of people from over a dozen communities that the Foundation attracted to its community politics program. The processes to name and frame issues were messy and frustrating affairs for many of these citizens, and the results of trying to have community deliberations about the issues were often unproductive.

Informed by my independent studies in several disciplines and my ongoing analyses of public issues, I pursued my own theoretical and action research agendas to develop and test methods for working on complex issues. I wanted to use the familiar patterns of issue-talk and transform them through orderly, comprehensive, and productive methods. My larger goal has been to help people give complex issues and questions the kind of attention and systemic action they need.

My years of experience taught me that the Kettering Foundation is right. Issues do need to be named and framed. Yet, through my research on and analyses of the nature of public issues and the usual patterns of issue talk, I developed three convictions. One is that those tasks need to be approached and performed far differently than Kettering’s method. This seems most important if the goal is to produce the multiple, high-quality issue frameworks that foster real deliberation and decisions about action at each phase of serious work on issues. Another is that additional steps need to identify the layers of complexity within typical public topics. There is more involved than often meets the eye, and those layers need to be treated as the nested issues they really are, and get addressed as such. The third conviction is that truly deliberative decision-making is essential to develop the scope of systemic action that complex issues and questions need. It has an important role in organizing, adjusting, and evaluating action. All of these are essential—that is, *integral*—to the thoroughness of efforts to address complex social systems. With these prerequisites met, I hypothesize that we should see some meaningful social transformations—in our issues-talk, communities, organizations, and more—because we will have the tools and insights we need to address the issues and questions we are concerned about. This is the overall purpose of TIP.

The process itself had previously been through field-testing, and this project was for implementing it to a limited extent. Its unique issue-framing process, which can be used as a standalone task, has been used a number of times over recent years. This project was the first time since field testing that I implemented the sequence of TIP’s steps up to and including its approach to issue-deliberation. Since this project was done with only one small group rather than in a community-wide setting, this implementation did not extend beyond the deliberation.

Deliberation is often called “weighing carefully.” This is a process of oscillating back and forth to carefully consider the pros, cons, and implications of multiple options. The oscillations take place inside and among individuals. If we are looking for them, they may be observed as zigzags within individual thoughts and focused, deliberative group discussions. This oscillating dynamic is a universal quality of decision-making. Indeed, we reach decisions by deliberating. Deliberations are intermediate points within processes to address complex issues: they are not end-points. This is because, if we are serious about addressing their roots and remedies in earnest, most issues require that the *polis* is engaged and involved over time—not as a one-shot deal. That includes individuals, groups, and institutions or agencies that have anything to do with a particular issue: those that support its existence, those who are affected by it, and those who can change the factors that have sustained the issue as a problem.[3]

For these reasons, TIP is designed for replicable, widespread use. It can also be tailored to organizational settings, where complex issues and questions have the same core qualities as public issues, and often need the same kind of systemic attention. It is beyond the scope I have set for this article to discuss the processes involved to scale and implement TIP in these and other contexts.

The Process Steps

This section begins with a brief orientation to the five main steps that were used over the six weeks of the project. Following that overview, in one sub-section per step, I discuss the step and the issue-work the group did in it. Each sub-section begins by repeating the general description of the step, and then describes the step’s purpose and outcome before introducing the group’s work. For some steps, I provide a narrative about the group’s work. For others, I allow the group’s work to speak for itself by providing a link to an actual product or incorporating a product into the article. Due to its limited size and purpose, this project did not use all of TIP’s steps or all of the processes within them; however, it did include the most essential ingredients for beginning to work on any issue.

Orientation to the Steps

This section conveys that TIP’s basic structure is sequential. The sequence goes progressively deeper into issues so that their many facets can be identified, understood, and addressed. This is a valuable orientation to keep in mind: TIP steps go vertically deeper in order to achieve meaningful focus and effectiveness. This is different than processes that move horizontally from problem identification to solutions. This reflects TIP’s assumption that (a) the nature of complex issues means that there are no quick fixes to them, and (b) that many distinct facets need tailored attention if an issue is to be addressed at its roots, i.e., systemically.

This project used the following steps.

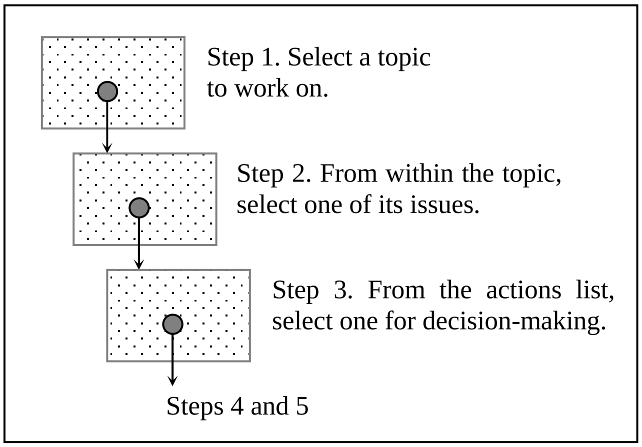
- Identify all the topics of concern within the bounds that the group has set for itself, e.g., community, region, organization, etc. Map how they interconnect and impact each other. Select a topic to focus on first.

---

[3] The subjects of *why* and *how* to engage and involve the polis are critically important and they warrant a full discussion in a separate writing.

- Identify the issues that are components of that topic. Select one of those issues. Identify the internal and external factors that support that issue’s continued existence.
- Identify all the possible reactive and proactive actions that could have positive impacts on the issue and that can be done by an array of diverse individuals, groups, and institutional actors. Select one of the actions that has high potential to make a meaningful change in the issue and that will require decision-making before it can be implemented effectively.
- Develop several viable, diverse approaches toward deciding upon that action, using the template provided to include all competing perspectives toward each approach. Produce a brief issue booklet about this question that needs deciding.
- With the aid of the issue booklet, deliberate all the pros, cons, and real world consequences and trade-offs involved with each approach, and articulate priorities, decisions, and the reasons for them.

The selection activities within the first three steps are illustrated in Figure 1. Its dotted images are intended to convey that at each step, a group selects one facet to work on at a time, out of many possible facets. This is like selecting one ingredient out of a stew. Figure 1 implies that a lot of diverse efforts are involved to work on all the ingredients of an issue. An issue’s complex make-up requires a lot of activity to dismantle it—just as a lot of collective activity has created and sustained the issue in the first place. The TIP steps are designed to unpack the ingredients that go into creating an “issue stew” so that people can be methodical, realistic, and thorough about their social change efforts. Ideally, many people work to address different ingredients, and TIP assumes at least some levels of concurrent activity in all of its steps except the first one. To stay within this article’s focus, I do not give these levels of concurrent activity more attention beyond this acknowledgement that they are important for effective social change efforts and that TIP assumes them.



Step 1. Select a topic
to work on.
Step 2. From within the topic,
select one of its issues.
Step 3. From the actions list,
select one for decision-making.
Steps 4 and 5

Figure 1: Selection activity in steps 1 – 3.

The Main Process Steps

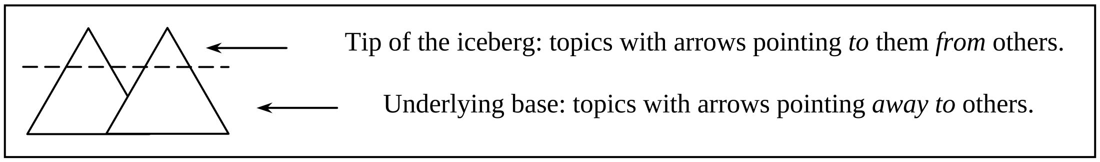
Step 1

The first task in this step is to identify all the topics of concern to the group, or group of groups, that convenes. Once that is done, several simple processes map people’s perceptions of the topics and their understandings of how the topics connect and affect each other. The purpose of step 1 is for a group to make a well-considered selection of one topic to focus on first.

In the first part of the step, the group in this case identified 39 topics as concerns. In my combined role of facilitator and recorder, I wrote on the wide flip charts whatever they mentioned. I did not edit any statements, nor did I invite or permit any discussion, for example, to find out if everyone agreed that something was a concern. The principle here is that all concerns are legitimate and have to be included, even if someone in the group does not agree with what someone else contributes. A concern is a concern and cannot be negated. This group seemed quite homogenous as people energetically cited their concerns. These centered on land-use and growth-related topics, many facets of the troubled communications and behaviors within the community, and some other social issues. Once they believed that they had reached the point of identifying everything, we did a brief process to notice different qualities that the topics had, based on how they were described thus far. The participants considered if the topics were about peoples' attitudes or values, and/or about human behaviors, and/or about how the community's systems or institutions were (or were not) functioning. Later, when we had moved to a process to cluster the topics, we noticed that the troubled communications cluster was weighted more heavily with attitude and behavioral qualities, and the land-use and growth-related cluster was more weighted as community system qualities.

To prepare them to do that clustering, participants first had to consider and identify which topics were interconnected with others. The simple connections that need to be identified at this stage are usually two basic types: cause and impact, i.e., one topic that is a problem contributes to another topic that is a problem. This was a thoughtful, though quick, linear process for the group to complete, with me drawing arrows to and from whatever topics they told me to connect. The outcome of identifying these interconnections was a map of the territory that concerned them. It indicated which topics were causing more problems than others. Such maps can show people that serious attention to one well-chosen topic of concern can affect many other concerns. This is usually helpful to note, so that the map does not seem to be overwhelming. Instead, people can use it as an ongoing reference tool that they update as they address their concerns; it can provide a meta-view of improvements, changing conditions, and adjusted priorities.

In their initial, raw form, such maps are usually a messy spaghetti-weave to look at, and this group's was no exception. Yet, that mapping needed to inform the group's choice of which topic to select. Thus, the next task helped to sort out the mapped topics by developing visual clusters or "icebergs." The group identified which topics were more like the tip of an iceberg, and which topics were more like an underlying base of support. The topics that are in the base of the iceberg will normally provide a practical range of starting points to choose from because they tend to represent causal factors rather than symptoms. This exercise is not for analyzing topics with any depth; it is a light-touch method to facilitate choosing a first topic to start with. Figure 2 illustrates the general approach to developing iceberg clusters.



Tip of the iceberg: topics with arrows pointing *to* them *from* others.
Underlying base: topics with arrows pointing *away to* others.

Figure 2: Developing topical iceberg cluster(s).

As they discussed which topics were more like the tip of an iceberg, people in this group distinguished the three clusters mentioned earlier. Step 1 does not require or invite participants to identify or analyze the relationships between clusters. In this case, the group had a catalyst to try to analyze the relationships. One person observed that the cluster of land use-related topics reflected consequences and symptoms of recent years' changes in the growing community's former status quo. Another person observed that the other cluster, associated with the strains that characterized local public life, reflected issues of process: "how we get the job done, relate, and communicate, how we do things, how things are working or not working.” Once these characterizations were in the conversation, participants seemed to feel impelled to figure out how to name the gap between the clusters: What *was* the missing link that would transform one cluster’s strains *so that* the iceberg of symptoms and consequences in the other cluster could get whittled down? The group could not figure out the answer to that question, but it did identify that the missing link would need mutual education of officials and citizens, and that it was hard to make the connection between the clusters when there was such a lack of communication in the community. This group ended its step 1 work when it selected its topic. Since these seemed to stand in the way of addressing all the topics of concern, participants selected: “the troubled interactions between the government and the people.” (Click here to view the outcome of the group’s work in step 1).

Step 2

Once a topic is selected, the next step begins with identifying the issues that comprise that topic. From among them, one is selected as a specific issue to address in earnest. Methods in this step help people identify all of the factors they can about what sorts of things support that issue’s continued existence. Step 2’s purpose is to develop a thorough understanding of the issue. Its outcome is a summary issue description that orients the next steps of work.

In the first part of this step, people articulate why the topic specifically concerns them and how it matters to them at all. Then they unpack the ingredients of the topic. There is no *single* way to describe why a topic is a problem that should be addressed, because it is really made up of a collection of causes, influences, and problematic impacts. These separate ingredients in the topic’s stew need to be specifically identified, because each of them is usually an issue unto itself that needs attention.

In order to sort through the causes and impacts of troubled interactions between government and citizens, participants in this case needed to tell some of the stories of their experiences. This was because the topic held quite a “charge” for some of the participants, given their very difficult history in the community. Once it finished this task, the group had deepened the topic of troubled interactions by identifying that “the issue, the problem with that is that citizens are unaware, frustrated, and therefore powerless, uninvolved, and misinformed.” This became the temporary working title of the overall issue they wanted to address. Their summary issue description (below) would further develop it and explain the reasoning that led from the topic to this issue.

The next task was to identify all the factors that held that issue in place *as* an issue that needed attention. The group worked with three basic elements to develop its understanding of the problem, and members of the group included themselves in these. The first element was all the attitudes, assumptions, and biases that different individuals and groups of citizens, officials, and public servants had, or seemed to have, about each other. The next element was all the concrete behaviors that supported the issue; in other words, all the things that people were doing that kept it propped up as a problem. These included behaviors of individuals, cliques of citizens, and government policies and administrative actions, and of course, they related to many of the attitudes in the first element. The third element was to identify the things that individuals or the government did *not* do—but *could*—that supported the issue’s existence by their absence. Those included behaviors and policies, too. All together, those elements gave the group a vivid understanding of why their issue was a legitimate public issue. Step 2’s work ended with the preparation of a neutral, non-blaming summary issue description, as follows.

How do we improve interactions between government and people in ways that reduce frustration, increase information exchange, and foster citizen participation and cooperation in their government?

The nature of the problem. The government and some of the people of the city and the surrounding area are increasingly alienated and adversarial. People who are troubled by this relationship, and the interactions that characterize it, are those who tend to be active in civic affairs. There is a long history of mistrust and conflict between groups, which has gone unaddressed.

Why this is a problem. For many active citizens, this adversarial relationship has a major negative impact on their quality of life. Active citizens need to feel at home in their community, rather than shut out of meaningful participation in civic affairs by their own government processes. As citizens of a democratic nation, they need to be involved in the rule-making and decision processes that impact their investments in their quality of life. Those investments include relationships, property values, and concern for the welfare of the whole community in the near and long term. Adversarial dynamics destroy relationships and entrench beliefs that "who ever does not agree with me, is against me." In a civilized 21st Century community, it is a public problem that citizens are feeling and acting like enemies toward one another.

Effects of the problem. Some active citizens end up feeling trapped in frustration, anger, or confusion. Some feel unaware of things they need to know. Others drop out of active engagement in civic affairs to avoid the frustration. Others spend large amounts of time and money to get their views included on the public decision-making agenda. Some fear retribution for getting involved in issues or for having views that differ from local officials and other citizens. Some are discouraged that the situation will not get better. There is risk of inconsistent and less effective official decisions when processes do not build in time to consider the full range of short- and long-term impacts. Such decisions can deepen divisions, and cost time, effort, and tax dollars to address their "fallout." Such unintended consequences have included lawsuits, ill will, lost trust, and small problems becoming big problems. In the adversarial atmosphere, viable solutions can go unexplored or be torpedoed if the wrong persons offer them. Mutual mistrust results in behaviors that widen the existing divisions. For example, some citizen requests for public information go unfilled, some feel the need to have a witness to certain conversations, some people quit speaking to each other, and some people who are not on "the right side" fear and/or have experienced a range of unfavorable treatments by city employees or official groups serving them at taxpayer expense. These cumulative effects result in some exemplary elements of the city government's mission going unfulfilled.

Causes of the problem. Both the processes of government and the attitudes of citizens—outside of and inside government—need to evolve, because both have trapped the community in troublesome patterns. Both government and citizens operate in ignorance of what all the "others" deal with and are concerned about. The community does not know how to handle its inherent diversity in non-adversarial ways.

Step 3

Once an issue has a clear summary description, it is ready for step 3's task to identify all the possible reactive and proactive actions that could have positive impacts on the issue. These amount to an action-system that would need diverse individuals, groups, and institutional actors to implement it. The purpose of this step in a larger setting is to do the first layer of organizing, launching, and coordinating action to address the issue. That includes volunteer activity and policy work, and starting work on at least one initial issue question that will need public, deliberative decision-making.

In this small project, the outcome of this step was confined to selecting one of the actions that would have high potential to make a meaningful change in the issue *and* that would require deliberation. For this group, the purpose of deliberating was to give them several experiences. They were: (a) to go through the process to prepare an issue for deliberation in step 4, (b) to have the experience of deliberative decision-making in step 5 *as if* they were the community,[4] and (c) to begin imagining how such deliberations could benefit the larger community and its issues.

The summary issue description, above, served as the basis and inspiration in step 3 to brainstorm all the possible actions of every kind that could address the issue. Its three pages' worth of diverse actions at all levels of the community revealed to the group that there were no magic wands involved to address the issue: just a lot of well-tailored actions of the right kind—inventive, mundane, and technical—by enough diverse players. The actions needed to add up in two ways. They needed to add up to ending the multitude of supports that held the issue in place. They also needed to include a comprehensive array of new actions and policies that would add up to proactive supports for a more positive political culture and system for public business. This potential action-system indicated a wide variety of voluntary actions that individual citizens, groups, and the government could take. At the same time, there were a significant number of proposed changes to public policy and administrative procedures. Some of them would need serious public attention, deliberation, and decision-making.

For this project, the group's last task in step 3 was to select one of the proposed actions that met TIP's criteria for when a question or issue requires deliberative decision-making.[5] As with most of the choice-points required in TIP, the group had to weigh priorities to select one. With such a large list of important items, this was challenging. So, this group began by highlighting four actions that it would choose from. Couched in the form of open-ended, neutral issue-questions, they were:

- How do we involve the whole community in deciding changes to zoning codes?
- Who needs to be included and considered in deciding zoning variances?
- How do we ensure transparency and access to all public information?
- How do we ensure accountability and protections in cases of retribution?

During step 2's work, I had begun to question if the group was as homogenous as participants' earlier assessments indicated, and to question my earlier assumptions about this, too. Then, and during some of step 3's discussions, I suspected that several people had somehow developed misplaced assumptions about the project's purpose. A few comments seemed to infer that this group would decide how to resolve whichever issue was selected. One small group could not resolve such an issue, of course. And, although subtle at this stage, I was picking up that there were different perspectives about *how* to approach whatever that action might be. I was able to digest all the implications of these signals after step 3's first session, although it would have been better if I could have explored them with the group with more immediacy. Those dynamics may have been in the mix at the point, above, when the task was to select a specific issue-question to work on. Rather than select one of those four questions, the group deviated from that task. Spontaneously, the discussion began to broaden and it was sprinkled with some new questions. These included: Why do we mistrust them? How do we understand the role and responsibility of government? How do we understand the roles and responsibilities of citizens?

---

[4] This project tailored TIP's design to accommodate the limitations of a small group working on a public issue, since such a group cannot make decisions that require many other people's perspectives and experience.

[5] These criteria are beyond this article's scope to include here.

A group may have a mixture of reasons to depart from a task. It can be as simple as not really understanding the task in the first place, feeling resistance to making a choice, and/or other dynamics. Thus, I always pay close attention at such junctures. Rather than insist that they finish the task, it was more important to let this new discussion unfold a little bit to listen to what was going on. Then, we reached the end of the session's allotted time. Step 3's final task of selecting an issue-question would have to wait until the next session, even though the participants felt discontented with the confusion they created during their final discussion.

I believe that a unique combination of factors led the group into its task-avoidance and confusion. People were juggling the emotional charges of the issue, along with the unusual high-level nature of the issue, along with the different assumptions mentioned above, along with an underlying *group level* issue that had not yet been identified: I sensed that there was an invisible "elephant in the room" that had to be identified so that productive work could resume. The dynamics indicated to me that a fifth issue-question had to join that list.

Between Steps 3 and 4

The discussion that closed the last session had continued to reflect some negative judgments of officials and other citizens. These had shown up in the earlier steps, and had quite understandable origins in historical community events. Half of the participants later referred to this as "the negative tone." If such a tone flavored efforts to foster positive change in an adversarial political culture, it would fail by being quite like the very culture it wanted to change. Ingredients of the invisible elephant in the room included the contradiction between (a) the group's expressed desire to improve the community atmosphere and interactions and (b) the tone that characterized a number of participants' attitudes—and then the silence about the contradiction. The most recent discussion suggested that participants were not of one mind about how, why, and when they should engage their overall goal, much less of one mind for choosing one of the four issue-questions they prioritized.

Some of the participants talked about this during the individual interviews after the end of the sessions. One of them mentioned that she had been aware of some differences among group members' orientations, but she had figured since everyone shared the overall goal to improve things in the community, that those differences would not really matter. By the end of the project, she had concluded that such differences would probably have repercussions if they had not been addressed directly.

The benefit of that last discussion was that the participants' diversity of key questions and confusion came out in the open. There were clear signs that the earlier sessions' opportunities to voice a wide range of emotions, along with their origins, had not lessened the strong influence of those feelings. These factors would make it easier for me to introduce them to their elephant.

I decided to begin the next session with an extra discussion before the group would choose which issue-question to work on in the remainder of the project. I would call attention to the dynamics I had been observing, and recommend a shift of focus. The shift would be from addressing the overall community issue at this stage, to first address the within-the-group differences. Unaddressed, I suspected those differences would make it hard to succeed in anything they wanted to do later on the community issue.

It is a potentially transformative process whenever we shift our focus from just paying attention to issues "out there," to also examining our own perspectives and assumptions "in here" before and/or while acting. This is called action inquiry.[6] For many people, it is an unfamiliar personal experience and an uncommon group experience. I felt an ethical imperative, for the sake of the group and the overall community issue, that we address the elephant in the room, even if it was hard for me to communicate to the participants what I was hearing and sensing, and why it led me to the conviction that it was important to shift the focus. With this goal in mind, I prepared some supplemental handouts for the next session, hoping they would facilitate the upcoming discussion about this elephant.

I would call the elephant a "tone and intention" issue-question. By tone, I meant the personal judgments that underlie human speech and behaviors. Judgments can be negative, or positive, or simply non-existent when someone feels genuinely neutral about things. Many times, people are unaware that their silent judgments—negative or positive—come through loud and clear as the tone within their speech and behaviors. Some of the participants in this group had negative judgments, while some exhibited no active judgments at all. The negative tones were influential in creating the group's atmosphere (just as they were in creating the community's atmosphere). By the term intention, I meant whatever we *intend* to have happen. Intentions reflect the *motives* that guide behaviors, and these motives underlie the tones of our speech and behaviors. In this group, there were mixtures of motivations that showed up in the contradictions described earlier. In times of change, it is very natural to have conflicting intentions, and we should always expect them in ourselves and in others. In this case, some were reactions to the past (e.g., "we feel the need to punish them first") and they conflicted with sincere intentions to work for a better future. Deliberating about a tone and intention issue-question would help participants sort out their mixtures of intentions and decide how they wanted to use them.

We spent some time at the beginning of the next session to discuss all of this. The rationale for working on their own tones and intentions seemed sensible to participants, at least on the surface. Possibly assisted by whatever trust-levels they had developed toward me, they agreed to shift their focus. It seemed to make sense that their own tones and intentions would affect other people if they tried to improve the community's adversarial atmosphere. The group developed new wording to capture the question they would work with. The wording reflected the idea about the impacts of the group's tone and intention on their larger issue of concern, expressed in these terms: "What kinds of relationships do we, as a group, want to have around the issue of troubled interactions with and among citizens, officials, and public servants?" With step 3's task completed, the group was ready for the next step.

---

[6] See: Bill Torbert & Associates. (2004). *Action inquiry: The secret of timely and transforming leadership.* San Francisco: Berrett-Koehler.

Step 4

Step 4's premise is that (a) people have a serious, specific question about taking action and (b) the question is more complex than one that just needs a debate between yes or no. The question must be one that could have multiple answers to either choose from or to intermix as a tailored response to the question. Its purpose is to make this complexity explicit so it can be worked with. In step 4, people develop several viable and distinctly different approaches toward taking action. These approaches need to ensure that all competing perspectives toward each approach are likely to be included. The process of developing such an "issue framework" creates an informed basis for deliberating about such a complex decision. The outcome of step 4 is a brief issue booklet about the question that needs deciding. It includes the reasons for asking the issue-question and a neutral presentation of the diverse possible approaches to it. The booklet serves to educate people about the issue, and people refer to it as a resource as they deliberate.

When a group has an array of tones and intentions to deliberate, as in this case, people can weigh how each option may contribute to or detract from an overall goal. Then, they can carefully choose conscious strategies in advance of any action. This can reduce the odds of people self-sabotaging their own efforts once their active work begins. This is especially valuable when the stated goal is to transform an adversarial political culture and there are some bitter feelings about it to begin with.

In its fourth step, the group developed four very different approaches toward the tones and intentions it could take, using TIP's template for issue framing. Each approach was a different way to respond to the question, "What kinds of relationships do we, as a group, want to have around the issue of troubled interactions with and among citizens, officials, and public servants?" The idea of asking about the kinds of relationships came from the group's recognition that intentions and their tones *flavor* relationships. Thus, the titles given to the four approaches reflected a different flavor, as follows.

> Approach 1: The intention and tone of preparing to organize an "us vs. them" campaign to get the changes we want.
>
> Approach 2: The intention and tone of preparing to take an "it's the law" approach to enforce needed changes.
>
> Approach 3: The intention and tone of preparing to take a positive "strategic encouragement" approach to get changes rolling.
>
> Approach 4: The intention and tone of preparing to take a fully collaborative community-wide approach to work on changes.

Although they always have qualitatively different subject matter, all approaches use the same outline to develop that content, using the following sub-headings.

1. We might favor this approach if we assume that…
2. This approach to the overall issue would be best because…
3. Examples of how we would prepare for taking this approach.
4. This approach may be worrisome, because…
5. Trade-offs that would be involved, including impacts on the kinds of relationships we want.

As introduced earlier in this article, deliberation refers to the natural oscillations of the decision-making process that goes on inside of people and groups all of the time. Those natural processes often take place rapidly and unconsciously under the surface, unless there is a major decision that we take our time to make. Then, we are more likely to notice that we are weighing the pros and cons of doing something. To weigh the pros and cons of just one thing is like having a debate between two possible answers. When the question is more complex because there are more than two possible answers and we have many consequences and what-ifs to consider, our internal oscillations can seem like a mish-mash. This can make it quite difficult to even articulate all of the options, much less the pro-and-con zigzags that swim in the mix. To lend coherent order to such messy decisions, each section of an approach, indicated by the sub-headings above, offers distinctly different opportunities to notice and shed light on those zigzags. Once identified, they can become active agents in the process of informed decision-making.

With this project's focal shift to intentions and tones, the processes in steps 4 and 5 proved to be the most meaningful and in some cases transformative for the participants, based on what they said in interviews afterward. The following description of step 4's work emphasizes the process of taking multiple, other perspectives while developing approaches to any issue. I recommend that readers look at each of the four, one page-long approaches the group developed, (click here), for two reasons. One is that they are lively and descriptive, which should make this discussion more meaningful. Another is that they offer a glimpse at the potential value of "politically *in*correct" language to deepen understandings of certain issues.

In order to do the step 4 tasks, each separate perspective has to be developed into an approach that is tailored to the question a group will deliberate later. This means "putting on" different vantage points, akin to putting on a different pair of glasses to see things differently until the next pair of glasses is put on. A chief benefit from step 4 that participants identified was *that* TIP provided distinctly different perspectives to work with. Since it is common for people to think and behave automatically from their own, customary view of things, it was a new experience to discover that *multiple* perspectives could be purposefully used to look at the same question. They found that each perspective had real legitimacy based on experiences, current conditions, assumptions, and needs.

To develop the perspective into an approach, participants first had to identify what that perspective would assume about "how things work." With my coaching support, they came up with two or three assumptions that seemed to underlie each perspective regarding their issue. Each set of assumptions had a different-sounding tone, which created the approach's flavor. For example, one assumption included in Approach 1 (the combative, "us vs. them" perspective) was "They're out to get/beat us." An assumption in Approach 2 (the legalistic perspective) was "We cannot trust our government officials." In contrast to these, an assumption in Approach 4 (the collaborative, community-wide flavor) was "Other citizens and city officials want good public relationships, good decisions, and effective processes just as much as we do." Since different assumptions result in different tones, intentions, and behaviors, developing the assumptions was the first task to do on each approach. Keeping the approach's perspective "on," participants developed the reasoning to explain why the approach made good and legitimate sense; this further develops the unique flavor of the approach. Then, they imagined and described concrete actions with that flavor that could address the overall community issue. These actions served as examples of how they might implement the tone and intention of each distinct perspective if it were used.

The second part of developing an approach so that it will generate oscillations that foster deliberative decisions is to *take off* the perspective that flavors the approach, and to put on as many *other* perspectives as possible that would find the approach worrisome for any reason.

Under the sub-heading, “This approach may be worrisome, because,” TIP’s template takes a very systematic approach to ensuring that all imaginable worrisome aspects are included in the approach. This is crucial for all public issues because such issues affect many different people who are in different circumstances, and not all of them will “be in the room” when such issues are deliberated. However, with this group’s focus on its own tone and intention, I followed my intuitive decision to facilitate this part of the task by relying entirely on what the participants would come up with on their own. Without any prompting from TIP, they would surely know what things would be worrisome to *them* if they adopted any of these different tones and intentions in the larger community.

The final part of developing an approach is to identify the real-world trade-offs that would be likely if the approach were taken. At least several of these have to be identified for inclusion in the issue’s booklet. They need to describe likely, concrete consequences for diverse people if the approach is implemented. This is because different people and groups, their self-interests, and the common good are impacted differently by different actions. We all do not have the same settings, concerns, values, or responsibilities. Thus, trade-offs illustrate real impacts that could be experienced from different angles, including individuals’ long-term hopes for the overall issue. A list of viable trade-offs not only keeps the issue tied to on-the-ground realities; it also further informs and strengthens the deliberative oscillations as people consider the future impacts of any decisions.

The group put on and took off all of these very diverse perspectives without judging or discussing the merits or demerits of the approaches they were developing. This is an important discipline, because it is unproductive to jump ahead before an essential tool is ready: deliberations have to wait until there is a complete issue booklet. Thus, these participants immersed themselves in each task at hand in order to create a meaningful and realistic vehicle that would serve their deliberations in step 5. These four approaches, combined with the summary issue description and some other material, formed the issue booklet that they used in the last session of the project.

Step 4 freed each person to give full voice to a wide range of distinctly different concerns without feeling pressure to advocate for any one of them. One participant reflected later on how the two steps—framing the approaches as a group, and then deliberating them as a group—served an important function.

> I was just thinking of the insight that we tend not to do that kind of decision-making in groups. To say, “Here are our options, let’s describe each one very thoroughly without trying to judge them, and then take a break, and come back to it and try to evaluate and judge. But only after we’ve really understood what each one of them means.” It’s a process that takes the competition out of it, up front, so people aren’t feeling they have to argue their point. They’re just describing each one, and people can suspend their opinions long enough to detail each piece of it. So, it seems like it brings some perspective, as well as it drops the intensity; they don’t feel they have to fight all the time for their particular thing.

They did not have to change their opinions in order to do this step, nor did they “lose” themselves by putting on and taking off perspectives that were different from their familiar favorites. To the contrary, they were preparing an orderly way to *use* all perspectives. As it turned out, this process of purposefully donning other perspectives helped many of them discover more about themselves, others, and their options for ways to operate in the world.

Step 5

With the issue booklet in hand, step 5 puts all the preparation to work. It is a deliberation of all the pros, cons, and real world consequences and trade-offs involved with each approach. Its outcome is an informed group of people that can articulate priorities, decisions, and the reasons for them. The outcome can include identifying new factors, e.g., if more information about the issue is needed, if more people need to be involved, and even if any other questions need to be deliberated before the current decision can be finalized or before things can really move forward.

There are several basic purposes of the deliberative decision-making process (and there can be more than several, depending on the issue and its scope). The first basic purpose is to reveal and understand the issue's complexity. The complexity reflects many different perspectives and the issue's impacts on different interests, concerns, needs, and real or potential conflicts of various kinds. To discover the complexities of an issue while deliberating it is a collective learning process, and it is always wise to do the learning before making decisions.

The next basic purpose is to identify the actors that are involved with the issue in any way, as thoroughly as possible. Actors will be individuals, groups, and organizations and institutions of various kinds, depending on the issue. They may be involved in a variety of ways, for example, by: (a) the impacts on them when the issue is addressed (and not addressed), (b) their resources or lack of resources, (c) significant changes they would have to make to implement or adjust to the issue being addressed, and/or (d) other facets of the issue that come to light *by virtue of* identifying the actors that are really involved. All of these factors matter, *if* the issue is to be addressed effectively.

A final basic purpose of deliberative decision-making is to lay the informed foundations and directions for organizing and coordinating complex work on the issue and the layers that are revealed in the process. This is because the kinds of issue-questions that need to be deliberated are often part of a systemic "whole" that requires much more than a one-time meeting or technical remedies.

For the project group's issue-question, the complexity was different. The primary purpose of its deliberation was to find out "where they landed" on the question, without needing to take any action at all to implement it. It was essentially an action inquiry. They would inquire into themselves, the local situation, and one another, to consider how different tones and intentions could impact public relationships if they flavored future actions. Another purpose that I hoped it would serve was to enable participants to imagine how deliberation, in general, could be used in the community to address the topics of concern that they had identified earlier.

The earlier negative tone was missing by the time this group began step 5. Two persons later expressed their surprise at this "dramatic" group shift. I think the explanation lies in the insightful observation made by the participant quoted above: the process of framing different approaches seemed to dissipate the negative energy.

As it concluded its deliberative session, the overall preference of the group was the tone, intention, and action-examples of the fourth approach (community-wide collaborative work) that it deliberated about. This was because the actions that could implement that approach would hold the greatest potential to foster *un*troubled interactions in the community: it would change the workings of public relationships and decisions. The group pragmatically recognized that there would be issues or situations when such a higher-level approach would not fit or succeed, in which case the next lower approach could be appropriate to try. It identified that there may be cases where none of the last three approaches could work and the first approach would be needed as a last resort.

The content and quality of the group's thoughtful deliberations are best reported by allowing them to speak in their own voice. I believe this is especially so in this case, because it was a groundbreaking event: people conducting a truly deliberative action inquiry about their tones and intentions and how their decisions would impact an already-troubled community. Their work was characterized by the rhythmic back and forths of deliberation's interactive reasoning. In that session, they demonstrated the capacities to remain focused, build constructively on one another's contributions, and arrive at well-reasoned conclusions tailored to their personal styles and the community's history and context. Click here to read the report on their deliberative session, which I prepared and edited for them from the session's audio recordings. It conveys the unique character of deliberative dynamics more effectively than any of the words I have written to describe it.

Transformative Impacts

The purpose of this section is to introduce two of the major themes that reflect significant impacts participants discussed at length during my final interviews with them.[7] In the first of two sub-sections, I draw from two participants' experiences to discuss the theme of transforming "us versus them" mindsets and behaviors. Then I develop the theme of liberation, also through highlighting specific participants' experiences. This theme showed up in personal and interpersonal dealings, public and private. These two themes merged to underlie a unique community project that two members of the group began to plan after the last group session. All of these influences could be expected to have some positive direct and indirect impacts on the adversarial community atmosphere over time.

"Getting Off Our Horses"

The negative tone that had been apparent in the group was initially introduced into the group dynamics by several people. They had had an accumulating number of disturbing experiences dealing with city hall and certain groups of citizens over the years they had lived in the community.[8] Each of them had a different kind of history in the community and different levels of activity. I cite only two of them because they were more influential within the group and the way they described their changes illustrate this theme best. One of them, who I will call Larry, had lived in the city for only a few years. In that time, he had trouble getting public information from officials to help him solve various problems and to inform his voting decisions. Along with those frustrations, he was concerned about the community being overdeveloped with both residential and commercial buildings. He had never attended a public meeting or been visibly active, but he considered himself very active by virtue of his considerable mental, residential, and child-rearing investments in community life. The other was a long-time activist who I will call Janet. She was involved in various ways in community organizing, citizen referendum initiatives, and lawsuits against the city to overturn or prevent certain official decisions. Janet and Larry began the project with points of view about local affairs that were quite similar to the first and second approaches that the group deliberated. Approach 1 was the tone and intention of an "us versus them campaign," which was how Janet and others had been using legal mechanisms for a long time. Approach 2 was the legalistic tone and intention of forcing officials to change through passing new laws and exercising vigilant oversight over and enforcement of existing laws. Larry's perspective toward officials reflected a combative, heavy hand of the law tone. Both Larry and Janet were convinced that officials routinely made questionable deals and violated administrative and zoning ordinances to the detriment of the community, relations with at least some citizens, and democratic process in general.

---

[7] Descriptive portraits of all participants are included in the longer research report in this issue, referenced in this article's footnote 1. They report the changes in people's levels of hope and motivation before and after the project, and convey more information about how each person experienced the process and applied its benefits.

[8] An analysis of how this tone "infected" the tone of the group is included in the longer research report.

In our individual interviews before the group work began, each of them explained in detail the local issue that concerned them the most. They described how they understood the causes of the issue, what should be done about it and by whom, and what they would do if they were in charge of making sure the issue was dealt with. In brief, Larry's remedy centered on requiring officials to disseminate *all* public information to citizens in a timely, accessible way. Thus equipped, citizens could "take the power back from the government" and control the community development directions and decisions. Janet had been thinking for a long time about what she would do to address the zoning-related issues (the real or suspected back room agreements, strategic appointments to the zoning appeals board, manipulations of the code, and outright violations). She would start a neighborhood congress system to be a defense mechanism, a counterforce against the city's power. It would select and support new candidates for public office that would support the congress's agenda. She wanted to ensure that the voice of a huge number of citizens was too strong for officials to dismiss, and believed such a congress was the only hope to alter the traditional dynamics and get a different caliber of public officials into office.

Those sketches capture how Janet and Larry began the project. They ended it very differently. In Janet's terms, it was time for everybody—citizens (including her) and officials—to "get off their horses," to step out of the vicious cycle of playing offense and defense with no end in sight. She would not build a defense mechanism against the city, but rather, something very different. For Larry, it was to "quit looking at it like an us versus them thing, because it's not an us versus them: it's a 'we.'" He no longer thought in terms of citizens ("us") taking the power back from the government ("them").

How did their experiences in this six-week project transform their long-held perspectives? A thorough explanation would include their self-reports about their thinking, their biographies, how they internalized all of the discussions and activities during the group sessions, and life events that were going on while they were having and reflecting upon their project experiences. It would also require a great deal of theoretical discussion, including the tone and intention issue, TIP's design, and adult development psychology. In the space of this short, general article, my explanation will simply draw from the main experts: the people who had the actual experience. I offer a synthesis of their reports about getting off their horses. The process of "laying down arms and coming to the peace table" was the way another participant described this shift.

Their first step in this transformation was noticing *that* they had been thinking like aggressive warriors. They had not seen it this way before. They had felt like victims of others' behaviors, and thus justified in taking a defensive stance. They had not realized that their defensive stance behaved just like an offensive stance. This was like finding out they had been playing a different role than they thought they had been. The idea of *role* was instrumental here.

Once they recognized that they had been in an aggressive role (mentally and in their concrete actions), they had a natural reaction to that discovery. They did the kind of mental role-playing that most adults can do: they imagined how their aggressiveness would trigger undesired reactions in others. Those reactions would seem to be defensive, but of course, they would be aggressive, too. In this way, they realized how they participated in a cycle of adversarial tones, intentions, and relationships, but, as Larry said, "I don't want to feel like an outsider to another group of people." Neither of them wanted that. Since they were now aware of their own roles in supporting many of the situations they did not like, they became open to alternatives.[9]

Fortunately, the group process that elicited these experiences and insights was simultaneously introducing them to a range of alternatives. They discovered for the first time that there *were* alternatives. They simply had not known that their view of reality was not really "all bundled up together" in one, unpleasant way. They did not have to be stuck where they were, and they could look at alternatives. They found out that they could step out of the vicious cycle, first mentally, then physically. The alternatives indicated that there were different ways to do this, so they would not be stuck in any single approach at all. This was a liberating discovery.

As is often the case, along with that liberation came feelings of insecurity, taking forms that reflected each person's uniqueness. For example, Janet said that although "getting off the horses first" was necessary, "it's not something that I am personally real comfortable about. It makes me nervous. I feel safer on the back of my horse. And I'm sure that they probably do, too." As a novice in civic affairs, Larry's fears were different: "I don't know if I've got what it takes to be able to do it mentally, physically, or verbally, so it kind of scares me." These and other participants found creative and further-liberating ways to experiment with and ease into their discoveries.

With these internalized understandings that "we need to act the way we want them to act" Larry and Janet took different paths. Larry's is reflected in the next section. Janet and another participant dove into early planning for a substantive, long-term goal to develop a "neutral platform" for non-adversarial community "network mechanism" that could include citizens from every part of the community, city officials and departments, and area groups and organizations. They planned to begin by conducting focus groups throughout the community to research and test their ideas and integrate them with what they would learn from others. Their intention was to foster communication and informal issue deliberations on an ongoing basis, so the "community organism could know itself" and begin to learn how to recognize and deal with its issues before they became situations that tore the organism apart. This did not seem to have a pie-in-the-sky idealism. Rather, it reflected the realism of the group's deliberative conclusions, that diverse approaches should be tailored to address conflicts that arise from time to time. They wanted to build an infrastructure to support local communications and information exchange, and proactively reduce unnecessary conflicts. Such a mechanism would support efforts to work through the inevitable future conflicts, too.

---

[9] There are important things to understand about how and when people *can* become open to alternatives at all; regrettably, they are beyond the scope of this article to discuss.

Liberated By Taking Multiple Perspectives

The discovery that they could consciously select from among multiple perspectives in forming their own thoughts—about anything—was the high point for some of the participants. Reports from Larry and a woman I will call Sue showed how thoroughly life-changing it was for them. There are both nuances and pronounced differences in how each person used their new insights. For the sake of brevity, I will highlight only Sue and Larry, and do so without discussing all of the differences I heard during their interviews.

There are, however, two differences about this case's issue-focus to point out at the beginning of this section. As I mentioned earlier in the article, people have been "framing" public issues for a long time; there are some different methods for doing this, including TIP's in recent years. A customary design is for one person or one group to develop the approaches into an issue booklet for *others* to deliberate the issue. In other words, most often, people do not experience both steps 4 and 5, above. Another difference is that if this project group had selected one of its four, prioritized issue-questions in step 3, before the tones and intentions surfaced as an issue, this transformative theme may have never developed, at least not in such life-changing ways as it did for Sue and Larry. The difference in this case was that the tone and intention issue invited a different kind of deliberative activity: self-reflective inquiry. By self-reflective, I mean that there was an explicit need for people to move their attention back and forth from the issue *within* them to the community issue in front of them, in order to reflect upon the implications of each possible choice of intentions and their tones. Unfortunately, our social settings rarely provide such transformative opportunities.

How were these experiences liberating to Larry and Sue? They released them from a trap. Although this played out differently for each of them, the common trap was to be wedded to one way of looking at things. As they both said, they didn't *know* there was any other way to look at and react to things. Many of us do not. This is reminiscent of the saying, "If you find that you are digging yourself into a hole, the first thing to do is: stop digging." That is easy for a critic to say, yet it does not consider this: what if digging is all we know *how* to do? What if we do not even know *how* to stop it? This could be like electric current without an on/off switch installed: the electricity just keeps flowing. These people were elated to discover that they could switch; they could look at and react to things in life quite differently.

The first step was to realize *that* they had been looking at and reacting to things in one way. An analogy may illustrate what this seemed to be like for them. If we never encountered any reflective surfaces—mirrors, glass windows, pools of water, etc.—and if we did not have arms and hands with which to touch our own faces, and if we never talked about seeing, how would I know that I *had* eyes? How would I know *how* I saw things at all? I suspect I would not even think about seeing, but rather just take it for granted, because neither I, nor our culture, had a concept of it to think about it with. Just so, many people do not have a concept of, or a way to, notice that they have a point of view. Often, we assume whatever we think *is* the way reality is. This is reminiscent of another saying: "Our perceptions are our reality." It is often true. We often *are* our points of view and so we have no reason to give them a second thought, just like the eyes that I am unaware of in the analogy. Both Larry and Sue made this point, that they had not had any *concept* about their own perspectives. The group process provided the concept for first realizing *that* they had perspectives. Simultaneously, as described above, they learned that there were other perspectives than their usual ones. This contrast supported their discovery that they had been using the same perspective to view things in life, even when it was not getting satisfying results. With the structured support and resources of the process as a starting point, they began running numerous joyful experiments in this liberating territory of multiple perspectives.

The group's focus on tone and intention was instrumental for *bringing home inside* what it *meant* to them to explore and use different perspectives. Larry's early experiments were with his family, and he found that it meant a whole new world of information that he could mine from within himself and share with others. He told me how his whole thought process had changed, and with it, his behaviors. An immediate benefit was that he became more approachable to his wife and children, who now clearly enjoyed being with him. Rather than reacting to things out of old habits, he took time to look at things from different perspectives—his own new inventory and those he imagined others might have—to find out what a whole situation might be about. He would ask questions now, and in a non-threatening way. All of this also meant a way to help others mine information from within them. One of several examples he gave was reading books with his elementary school-aged children. He would suggest they pause at various points in a story, and talk about what perspective a character was using at that particular point. Then they would imagine what *other* perspectives might the character take, and how would the story be different then? He found he could directly transfer his learning from TIP to any other domain in his life, including educating his children so they would not live in the trap he had just emerged from.

This played a major role in transforming how he wanted to address the issue of citizen access to public information and community development: it erased the dividing lines between "us" and "them." For the first time, he was viewing the entire community as a "we" without those dividing lines. For him, it had become a system in which to exchange as much information as possible about points of view and respect them *as* valuable information, even when they were different or conflicted. He would respect those differences. With his experience of becoming un-wedded to one point of view, he wanted to help other citizens appreciate the information-value of differences and respect them, too. The exchange of viewpoints *as* essential information became a main criterion, in his view, for developing a healthy community.

For Sue, bringing home the learning about using multiple perspectives meant exciting new ways to approach all of her interpersonal dealings and her modest social change efforts. She integrated those new insights into her thinking about the issues she was most passionate about, nationally and locally. I do not discuss details of her experience here because I think the following observation eliminates the need to do so. I observed that although there were significant differences in her and Larry's interests and "where they were coming from" in general, before and after the project, she used her learning in ways that were similar to Larry, but from a different angle. Her palpable excitement was that she now had ways to decide what approach to take with individuals, groups, or organizations: she could "handle it according to *who that person is*." She developed a detachment from her own preferences that enabled her to assess a situation in a more comprehensive and realistic way. She could consider the person or persons involved, their individual and/or institutional constraints, the individual and social needs that people were trying to meet or were unaware of, and base her strategic approaches on who the people *are* that she was or was going to be interacting with. She was running experiments with her grown children, extended family, and friends in the community who were concerned about the same issues she was. Our interview was punctuated by a phone call from one of her children, whose reaction to a recent interchange with her was so positive that he called spontaneously just to tell her he loved her. With a laugh, she told me, "See? It's because of how I approach the situation!” Her new sense of general empowerment was both exciting and liberating because she felt equipped with new powers of discernment. These fed her creativity for conceiving new ways to help others learn how to use multiple perspectives, to see others’ conditions with new eyes, and to see how systemic complexity needed to be addressed. She saw this as the best hope for breaking certain kinds of cycles that trap both citizens and their societies.

In this group’s community, with its troubled interactions between citizens and their government, there was a long history of “us versus them” dynamics and entrenched positions that clashed in important issues. What happened during this project has potential to influence changes in that political culture. As I write this, it has been almost six months since the end of this research project. I have not returned to the community—a follow-up study is decidedly alluring—and thus, I cannot report further than this about the transformations that participants experienced.

Conclusion

This article divided its focus between the steps of “The Integral Process For Working On Complex Issues” that I used in this research project and discussed it with the group’s work on an issue, and the two predominant themes that emerged from the participants’ final interviews. A brief summary of the project’s outcomes may help to pull these subjects together and summarize this reporting. Those outcomes include both the participants’ perspectives and my own, as the researcher.

A first outcome is finding that a number of participants connected their increased sense of hope and motivation toward the community’s issues to learning that there are processes and methods for dealing with issues and diverse perspectives on them. That was particularly meaningful because it included learning that perspectives can be distinguished and worked with, with productive implications for the issues, i.e., there were reasons to hope. Another outcome was that the negative group tone had a dramatic shift into a productive, positive tone, apparently as a natural byproduct of the process itself. Although a small, self-selected group is not representative of any larger population, for this group concerned about the negative local culture, to experience a dramatic shift even at this micro level was significant and hopeful. Participants learned about ways to anticipate and accommodate multiple perspectives on issues and within their own intentions and tones. They developed their own conceptions of how they could use their learning, and/or described how they were already using it to meet their interests and affect their own and others’ experiences. A new small group formed to develop a freshly conceived approach to a community network mechanism, which it hopes will facilitate positive change in the adversarial political culture over time.

From my perspective as researcher, the unexpected outcomes of this project were (a) the tone and intention issue itself, and related to that, (b) the project’s impacts on participants. As far as I know, it was groundbreaking for a group to conduct an individual and collective reflection that inquired into intentions and tones using deliberative methods. The impacts and learnings that the participants internalized and used within such a short time are the most significant changes—personally, socially, politically—that I have ever seen in my years of working with individuals, groups, and communities.

Of the countless public issues that I have had the privilege to work on with other citizens—on the ground “live,” as intentional action research, and in assorted educational settings—I never had the occasion to work on a tone and intention issue. Although this was the first opportunity, it was not the first time or place that I saw a need for people to address their public relationships and attitudes.

Some years ago, I summarized my thinking about how to address complex public issues in such a way that efforts would foster healthier evolution of individuals and their political cultures and social institutions. Based on the experiences that I had accumulated at that point, I prioritized that thinking based on the importance of conditions that show up often, not just in this project's site community. To date, I still agree with the first item in that summary.[10]

> Address the community's most presenting or hidden needs first, those which, if left unaddressed, would likely sabotage other efforts.
>
> - Troubling relationships and their history
> - Assumptions about capacity, knowledge, power, leadership, inclusivity
>
> a. Provide a method for recognizing them because people need to become conscious of them before they can intentionally work through them.
>
> b. Provide a method for working through them because the [likely] alternative is paralysis or regression (p. 2).

Because of this study's findings, I have institutionalized the tone and intention issue: TIP's methodology now incorporates it as a specific option for groups to discern using before addressing other issues. Whether or not existing troubled relationships or misplaced public assumptions appear to characterize a political culture, in these decades of rapid change, with their clashes of worldviews, expectations, and competitions over rights and resources, the potential for an increasing number of tone and intention types of issues is, itself, a pervasive—if unrecognized—socio-political issue. Thus, this small study seems important because it documents that at least in this case, using TIP helped people and may help their community. Further studies on tone and intention issues at larger scales could make vital contributions to how we understand and foster healthy social change.

In recent months, researcher Richard Harwood has been traveling the United States to promote and discuss his book, "Hope Unraveled: The People's Retreat and Our Way Back."[11] He reports, "people can no longer see or hear themselves reflected in politics and public life…. They abhor this retreat, but feel lost about what to do… [We need to] square with the reality of people's lives…tap into people's desire to be part of something larger than themselves…affirm our commitment to hope."[12]

I first heard about Harwood's book as I was concluding this study's fieldwork. I had been hearing how much *more* hope and motivation participants had in our closing interviews. A number of them who had felt lost and hopelessly shut out of their community's life at the beginning no longer felt so by the end. Further action research could indicate if the methods used in this study would be effective to implement Harwood's prescriptions. They might fill such prescriptions while people are addressing their issues and *being* their communities' new politics and public life—not just reflected in them, but enacting them, themselves.

Epilogue

For readers who are interested in integral theory as promoted by Ken Wilber and his Integral Institute, and who are curious about the qualities that make TIP an integral process, this section points out those connections in the steps described above. For brevity's sake, I confine this correlation to only those steps, and I assume that readers of this final section are already familiar with integral theory. Therefore, I do not define its basic terms that I refer to below. TIP does not use the theory's jargon, and its incorporation of "all quadrants, all levels" is natural, since all issues inherently include them.

Step 1. Meeting people wherever they "are," it invites concerns to be expressed in whatever terms reflect the way people already think about them. Then people identify the topics' chief (apparent) characteristic(s). These may be individual and/or collective attitudes or values (left hand quadrants), and/or the behaviors of individuals and/or social systems (right hand quadrants).

Step 2. The selected topic is broken down into its concerns, impacts, and causes; in effect, all of its integrated quadrants and levels. Whichever of those is selected to work on as an issue, is analyzed in terms of the all quadrant/all level elements that support its existence. If a "human behavior issue" (i.e., any issue where individuals' behaviors are "problems") is selected, it gets extra, developmentally tailored attention and investigation into complex causes, but it is beyond my scope to discuss how that happens here. Participants develop an integral understanding (a "portrait of the issue") that integrates the left- and right-hand quadrants and pertinent levels of worldviews that comprise it by their presence or their absence.

Step 3. An integral array of all quadrant actions and assumptions on the issue addresses the relevant developmental (individual and social) levels involved. Its analysis identifies how individual and collective attitudes and behaviors will be interactively improved or changed by each of the new actions and changes proposed. Criteria for the kind of decisions that will require multi-perspectival deliberation promote integral attention to social change and its challenges.

Step 4. The issue-framing template embeds the distinctly different perspectives of all developmental levels' concerns, values, and stakes in the issue, tailored to the specific issue that is framed. The framing process invites reflective consciousness by identifying underlying assumptions and walking in the shoes of all perspectives without judgment.

Step 5. Deliberations engage all the perspectives on an issue and the tensions of diverse, possible actions on different parties' life conditions, values, and agendas. Depending on the complexity of the decision or issue, deliberations can result in integral or meta-system approaches to address the issue. All quadrants and all levels' interiors and exteriors are inherently worked with, and worked through, in this method.

I hope that this overview, read in conjunction with the body of the article, responds to any basic questions about how TIP has correspondences with integral theory, for those who are interested.

Plain and Integral: An Interview with Karen Kho

By Jonathan Reams

Abstract: Karen Kho describes her work in the Alameda County Green Building Program. She covers the application of an integral framework to working with a variety of stakeholders in the residential building industry. This work includes a stakeholder analysis, rating program, educational materials and guidelines. How the program expanded beyond Alameda County is also covered.

Keywords: Green building, integral, residential home building.

Four or five years ago I heard about some work that David Johnston was involved in as a consultant, applying an integral framework to developing the green building industry in Alameda County in the east San Francisco Bay area. Green building is a term used to cover a variety of practices focused on creating environmentally responsible, energy efficient and healthy places to live and work. In the fall of 2004, I was doing some consulting work in that area, and heard that he was going to be speaking on the topic at the Integral study group that takes place at the California Institute for Integral Studies. I attended the talk he gave, which was followed by a wonderful presentation from Karen Kho, who works for the Green Building program in Alameda County. Her presentation was a balance of theory and application that grounded the integral perspective in a real world application.

A year later, in thinking about interesting topics for Integral Review, Karen's presentation and brief paper came to mind. I asked her if she would be interested in telling more of the story of the Green Building program, and how it has spread beyond Alameda County. The following is the result of two interviews and some further back and forth between us.

As I interviewed Karen, what revealed itself clearly was how an integral awareness was engaged in a very pragmatic endeavor, and that there was a current underneath all of the activity weaving it together. The glimpse of this awareness that came between the lines sat with me long after the interviews.

Jonathan Reams

Q *I'd like to begin by asking about your background. What brought you into the area of green building practices?*

A I started off as an environmentalist, a conservation major in college until I realized that environmental problems were really tied up with developmental problems. So I studied international development. In retrospect, I'm not sure I learned much about development, except that well-intentioned people could easily make things worse rather than better. Instead of going overseas, I decided to stay closer to home and become an urban planner. Planners attempt to integrate different disciplines like economics and sociology, and to work with people from many different sectors. Before coming to the Green Building

SOME RIGHTS RESERVED

program, I worked in transportation, community development and urban sustainability. My work has centered on social change, of one kind or another, and I have always been interested in knowing what makes some approaches more successful than others.

Q *This was a question floating in the back of your mind.*

A Yes. When I'm engaged in the actual work I do not have a lot of time to think, I'm putting out fires and implementing a program from day to day. It takes an effort to step back and ask—how effective is this program? Is it accomplishing what we're hoping to, or are we pushing ahead because the course got charted a long time ago? I have always been a student of development in the broadest sense—interested in what makes things work for individual people, families, cities, as well as society as a whole. Observing the dynamics of development has been fascinating.

Q *In reflecting on why some things work better than others, what did you discover along the way?*

A Speaking from the context of community development, two things come to mind. First, the more people that are engaged, and the more diverse their perspectives, the more potential there is for positive change. Second, the more that a community is able to tap into local creative thinking, the more it can generate solutions tailored to its unique circumstances. There's a stark difference between a community that has confidence in its own ability to innovate, vs. those that look outside for experts or money or off-the-shelf solutions. I believe the true art of community development comes in facilitating unity-through-diversity and fostering creativity.

Q *I agree. So how does integral theory fit into this for you?*

A Even though I completed my formal education a decade ago, I continued on a path of self-directed study. I find most people are either in the world of practice or in the world of theory, but I need a foot in both. As Paolo Lugari, the Colombian visionary, says, "There is nothing as practical as a good theory." What fuels my learning is the question: What are the universal principles that can explain how the world works? I had been seeing correlations between healthy self-development, a good relationship, a productive office and a sustainable community. Well, when I came across integral theory it provided a lens to focus on the dynamics of development. You can't remedy complex social problems by only looking at the external factors. You have to understand the values or motivations of people.

Q *What were your early efforts at utilizing integral theory for creating solutions to the problems that you were facing?*

A My early efforts at using integral theory were basically "testing it out" to see if it correlated with strategies that I knew from experience were successful. I believe there's a lot of good work being done by people who have never heard of integral theory, but if they are successful, most likely they are doing things in an integral way. They have an intuitive understanding of how to do things in an integral way.

Q *They may not have the lingo but they're doing the work.*

A Exactly.

Q *You currently work for the Green Building program in Alameda County. How did that program get started?*

A The Green Building program in Alameda County got off the ground in the late 1990's. In Alameda County a portion of landfill fees are set aside for outreach programs to reduce waste, such as promoting recycling and composting. Green building became a priority area because 20-30% of the waste comes from the construction and demolition of buildings.

When the Green Building program was started, the initial activities included giving grants to build demonstration projects and organizing public lectures. The demonstration projects were not having a broader impact, because the builders doing most of the construction weren't even paying attention to them. So my colleagues hired David Johnston as a consultant to help reach a broader audience.

Q *So, there was an awareness that the conventional methods for getting people to change their practices were not working. How did the integral approach and the consulting that David did influence the program?*

A I don't think there's a common understanding about what constitutes an "integral" approach. What I mean by integral is that one considers both technological, quantitative factors and social or qualitative factors. And you are working with the key stakeholders in an appropriate way. For the Green Building program, this meant reaching out to the mainstream builders, who are doing most of the construction. You can't point fingers at the building industry; you have to engage builders and understand how they work.

Q *That was the fundamental premise that enabled all of this work to flow?*

A Yes. I think the thing that David really brought to the program was an ability to tap into values, motivation and culture—Wilber's lower left quadrant. He was instrumental in bringing together key groups and tapping into the reasons that they might be motivated to do green building. Initially that included production builders and city officials.

Q *To create a value proposition for those groups that would make them say okay, I'll come to the table.*

A That brought them to the table initially. Over time, we need to deliver on what we promise. You are circling around the quadrants in a sense. First, you generate interest and focus on understanding values and motivation. Then you need to provide services and meet the needs that have been identified. As people get engaged in the program's activities it may shift their sense of who they are and what they're doing You might even find that someone who was rabidly opposed to green building becomes its most enthusiastic proponent.

Q *That idea of moving around the quadrants makes sense. If you started with their motivations and the value system and then asked them questions like what do you need, what would help you, and then on the external side delivered individual information, put together structures and facilitated things like meetings with the regulators. It's like you say, it helps them understand their relationship better, and opens up a different developmental level of conditions where they can come back and say now we need this as well.*

A Yes that's how it can work. As things are unfolding, I pay attention to where are we in the cycle. Do we need to stimulate a group's motivation again and remind people why they should care about green building? Or are people really engaged and hungry for more information? One of the things we're working on now is a rating program. It was not a priority when the program started. But now it's something people want. They are ready for it.

Q *It sounds like it is kind of an evolutionary or developmental process where you were able to meet some basic foundational needs and wants, and as those settle in and take root a new set of needs occurs.*

A Right. The need may have shifted to another quadrant or to another group. In the fall, I was spending a lot of time developing material for the production builder group. Now we're working with remodeling contractors. It's a constant process of balancing activities and keeping the overall picture in mind.

Q *How do you use the integral framework now?*

A Aside from David I don't work with anyone who speaks in Spiral Dynamics colors or integral lingo. The language can be a real stumbling block. But as I started mapping out integral theory against the daily reality of promoting green building, I realized that there was a very simple way to capture the essence of it. I found a way to communicate "integral" without using any jargon.

What I did was take Ken Wilber's Four Quadrants and distill them into four questions that anyone can understand. Who? What? Why? and How? *Who* addresses the intentional and subjective—it speaks to self or group identity, *Why* examines values, motives, cultural norms and worldviews. *What* leads you to behaviors, products that are created. And *How* elicits the rules, roles, social systems and organizations that make those behaviors or products possible.

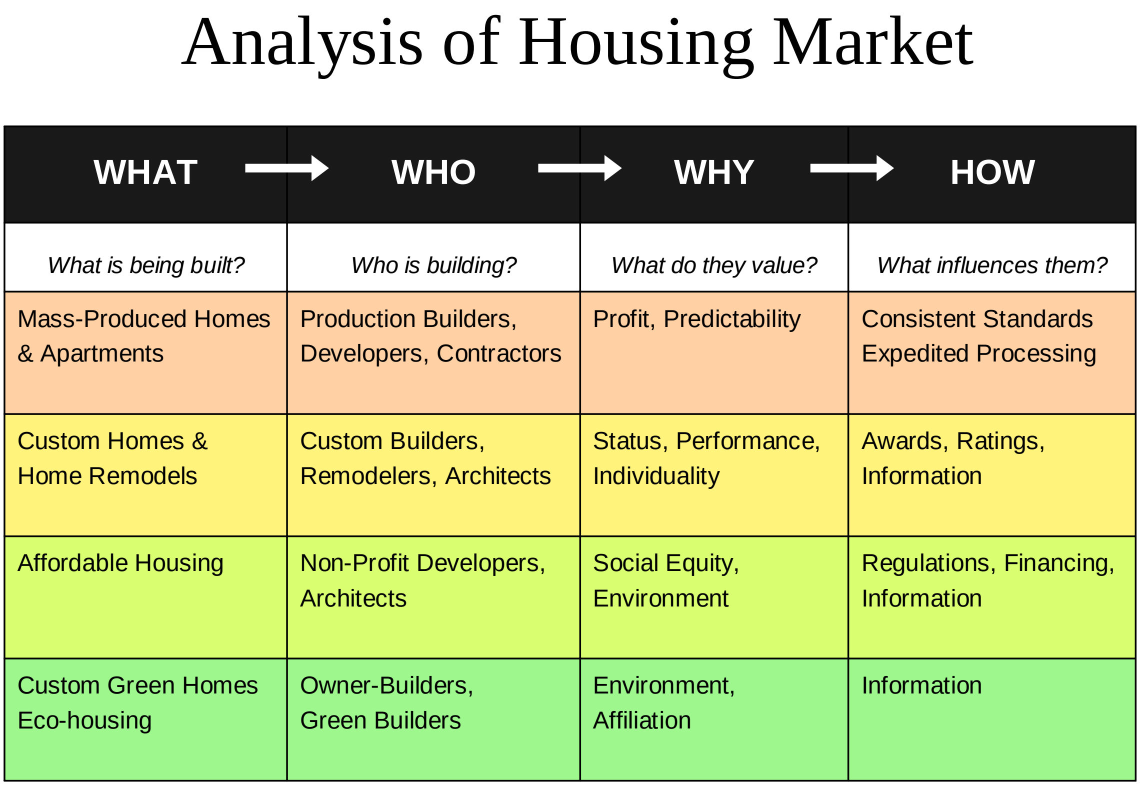
Organizations
Social Systems

Figure 2: Overview of the 4 Questions.

A As I described earlier, I use this framework to evaluate what needs the most attention in our green building program. I am often asked to speak to groups that want to start a green building program. So I incorporate the four questions into the process.

It's quite a common practice in business development or community development to conduct a stakeholder analysis. I've taken that framework and embedded it with an integral structure—the four questions. When you've completed the stakeholder analysis, you have a good idea about the points of leverage. From there, you can create a program of action.



Analysis of Housing Market

WHAT →	WHO →	WHY →	HOW
What is being built?	*Who is building?*	*What do they value?*	*What influences them?*
Mass-Produced Homes & Apartments	Production Builders, Developers, Contractors	Profit, Predictability	Consistent Standards Expedited Processing
Custom Homes & Home Remodels	Custom Builders, Remodelers, Architects	Status, Performance, Individuality	Awards, Ratings, Information
Affordable Housing	Non-Profit Developers, Architects	Social Equity, Environment	Regulations, Financing, Information
Custom Green Homes Eco-housing	Owner-Builders, Green Builders	Environment, Affiliation	Information

Figure 3: Results of Stakeholder Analysis.

In the case of green building, we are concerned about what kind of housing is being built. First, you identify the types of housing being built in a community and list them by the quantity of production. Second, you identify the stakeholder groups that are building each type of housing. Third, you examine the values or motives of each group, and last, you consider what will influence each stakeholder group to "green" their activities. So you start with What, then shift to Who, then to Why and then to How. The chart above shows what this analysis looks like in our county, and for California overall.

Q *On your stakeholder analysis chart you show that the custom builders and remodeling contractors tend to be more interested in status, performance and individual creativity as where the mass production homebuilders want profit and predictability. There would be very different motivations for these groups.*

A Right, and it's not that homebuilders would turn down the opportunity to gain recognition, but it's not the prime motivator for them. We promote tours that showcase homes constructed with green building practices. These tours are much more popular with the architects and the remodelers than with the production builders. The remodelers appreciate the opportunity to showcase what they've done and get more business. In recent years, the production homebuilders have had waiting lists for homes that have not even been constructed yet, due to the housing shortage in California. We included a couple of their homes in the tours but it has not been a key leverage point for them.

Q *How do you develop a program based on the stakeholder analysis?*

A In Alameda County the program evolved dynamically, in response to the needs that arose. First, we needed to define green building and debunk misconceptions – so we developed green building guidelines. After the guidelines were published, people wanted to know where to buy products and who to hire to do the job. Then building professionals needed training and we had to address the supply of green building products. So, the program elements came together incrementally. If you are building a new program from scratch, you need to start with a stakeholder analysis so that you identify the right target groups. But the way you build your program will depend on the resources and opportunities unique to the situation.

When I speak to cities that are starting a new program, I give them an outline of the elements they should consider based on what we've found to be effective. What they choose to focus on will depend on what kind of building is taking place in their community. The good thing is that they don't have to develop the tools and practices from scratch, as we did. But what can't be substituted is the local groundwork of convening key stakeholders and developing shared values and motivations. (The lower left quadrant work). Every community needs to do that for themselves.

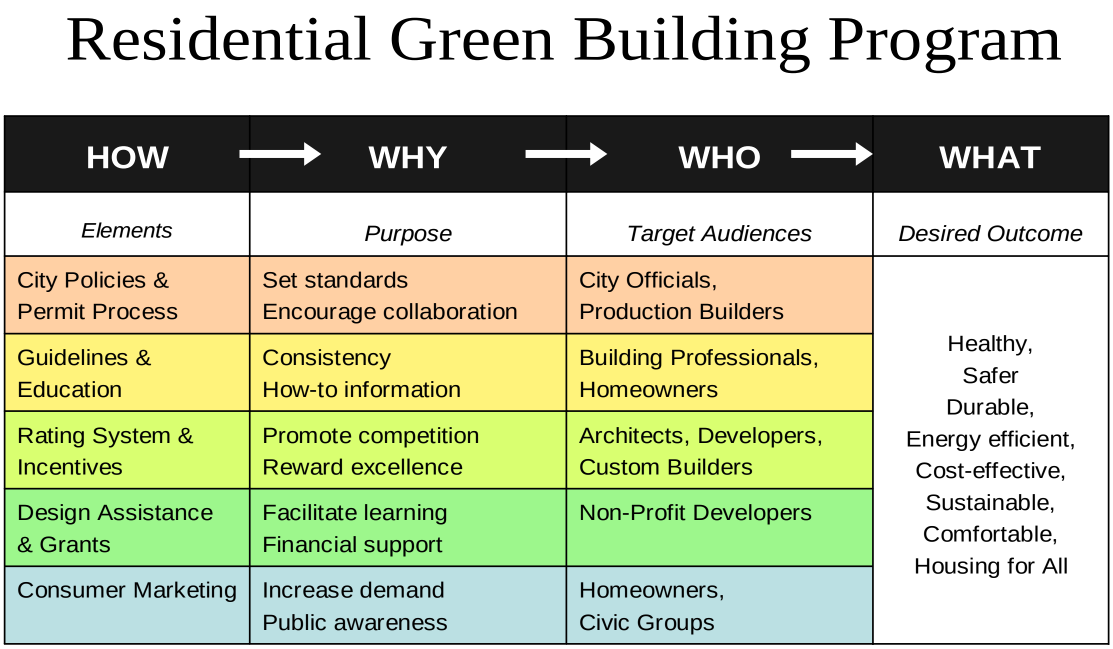
Q *Could you highlight the main elements of the work that the Green Building program does?*

A As you can see on the chart below, the main elements are policies, guidelines, ratings/incentives, technical assistance/education and consumer outreach.

We work with all the cities in Alameda County by providing recommendations on what policies they should adopt for their own buildings as well as private sector buildings. Often we find ourselves bridging between the cities and the builders. Builders feel that cities are over regulating everything that they're doing and that getting a project approved costs far too much money and time. Many cities, especially the more mature ones, feel that the builders ought to be required to do more. They both have valid concerns, but they usually don't communicate in a non-adversarial way. We often serve in an intermediary role.

I'm speaking primarily about the residential sector because it's more complex—and accounts for more construction. We developed three sets of residential green building guidelines, because each one addressed a different stakeholder group. They differ in their construction methods, their motivations, and their business models. Production building is predominant in the east part of the county. So, we work with large-scale builders to identify practices appropriate for them. The west part of the county is mostly built out, so you see a lot of smaller projects and remodeling. And in the multifamily sector, there are many non-profit developers, with very different needs and constraints than the production builders or remodeling contractors.

Once we had released the guidelines, people wanted to know how much you had to do in order to call a project "green." So, we created the Green Points rating system to help builders track what was in their project, and cities to know what was being proposed. We offer grants and incentives based on how well a project scores, either based on their residential Green Points score or commercial LEED rating.



Residential Green Building Program

HOW →	WHY →	WHO →	WHAT
Elements	*Purpose*	*Target Audiences*	*Desired Outcome*
City Policies & Permit Process	Set standards Encourage collaboration	City Officials, Production Builders	Healthy, Safer Durable, Energy efficient, Cost-effective, Sustainable, Comfortable, Housing for All
Guidelines & Education	Consistency How-to information	Building Professionals, Homeowners	
Rating System & Incentives	Promote competition Reward excellence	Architects, Developers, Custom Builders	
Design Assistance & Grants	Facilitate learning Financial support	Non-Profit Developers	
Consumer Marketing	Increase demand Public awareness	Homeowners, Civic Groups	

Figure 4: Program Development.

We offer a full range of educational programs—tailored to each of the stakeholder groups. Sometimes these are developed in conjunction with a partner organization like Build It Green or the local chapter of the US Green Building Council. We also provide free technical assistance to certain projects, to help reduce the learning curve. This has been helpful for city or county public works staff to learn to manage civic green building projects and incorporate green building into standard practice. We've also found it helpful for nonprofit developers.

Q *How are you able to have an impact in the multi-family housing market? What has been your best leverage point with that stakeholder group?*

A We have had a really good relationship with non-profit developers because they don't need to be convinced of the importance of green building. The barriers for them are technical knowledge and financing. They wanted a lot of information—everything you need to know to decide if a green building practice will be appropriate for your project or not.

Q *All in two pages.*

A Exactly. And so unlike our other two guidelines, the one for the multifamily buildings is a 200 page reference document. The project manager can bring the two-page summary to the team meeting with their architect and subcontractors. We gathered up the technical information that would otherwise take them a long time to find. We do not have a product like that for the production homebuilders. Even if we did produce one they wouldn't take the time to read it.

Q *So, how do you reach that market? What kinds of support or information are you able to provide for them?*

A The production builders who are doing green building want to be seen as quality builders. They want to maintain a good reputation. They see that more and more cities are asking about green building and they don't want to get left behind.

Q *It is part of staying up with the most current trends and having a reputation for quality that is seen as a long-term advantage for those builders.*

A Right. The main motivation for production builders to work with us is that we provide a bridge to the cities. There are lots of cities around the state that are looking at what we're doing and copying. So they want to help shape what we're doing because it might have a larger impact.

Q *How much has the public had an impact on this? Have they started asking for this more and more?*

A What we hear from the production builders is that the public is not asking for green building yet. It's probably due to the lack of information, but also the housing shortage in California. Consumers have not been picky about what they buy, at least not recently. In the past, we have sponsored public lectures and workshops, and organized home tours. But in the coming year we will be focusing on consumer marketing. Now that we have provided education to the builders and created awareness on the supply side, we can put more attention on generating demand.

Q *How has the success of the green building program in Alameda County started to attract interest from other counties in the Bay Area or elsewhere in California, and what has that led to?*

A We have made all our educational materials available to cities and counties in California and beyond. Most of them do not have the resources to work with the stakeholder groups and technical experts. We made a commitment to our builder committee that we would promote consistency among local jurisdictions. They don't want to go to other communities and have to deal with different green building standards. So, we are active throughout the state.

I helped start a network of public agencies with existing and nascent green building programs. It began with eight or nine active programs in the San Francisco Bay Area, but it has drawn people from as far away as Fresno and Truckee. The group meets quarterly, and now a sister chapter has formed in Southern California. There are almost 70 jurisdictions involved, and more contacting us every week.

We, Green Building in Alameda County, see ourselves as a seed organization that jumpstarts activity in green building and develops the resources that are needed. Since our program is geographically restricted to Alameda County, we look for other organizations that might be a more appropriate long-term home for the resources that we develop. For that reason we helped found Build It Green, a California non-profit organization that is promoting green building. Build It Green has taken over several of our programs, such as a certification program for building professionals, home tours, and a database of green building products.

Figure 5: Build It Green councils and guilds.

We (Green Building in Alameda County) have also been interested in fostering interactions among different stakeholders in the green building market. So, we have worked closely with Build It Green in convening and facilitating the formation of other stakeholder councils. I mentioned the network of public sector green building programs earlier – this group comprises the Public Agency Council of Build It Green, with chapters in Northern and Southern California. We supported the formation of a Green Remodelers Guild in Alameda County, which included graduates from our Certified Green Building Professional programs. The Remodelers Guild is now a council of Build It Green.

In addition to the Public Agency Council and Green Remodelers Guild, there are a Suppliers Council, Builders Council, a Nonprofit Network, the Real Estate Council, and an Green Affordable Housing Coalition. Those groups are self-directed. For instance, the remodelers meet ten times a year, and they want to learn from each other and bring in experts on various topics. The suppliers group is looking at ways to get some of the green building products to market and removing barriers. Each group has its own interests. Build It Green provides a forum for all of them; it is becoming the social glue.

Q *It is very clear from your description to see how it has organically blossomed. From something that was seen to work, people have been attracted to it, and it's been able to meet multiple stakeholder needs in a way that continues to grow in a very positive and successful way.*

A Yes. And I hope that in the next couple of years Build It Green will be able to encourage more interaction among these different councils. Each of the stakeholder groups needed time to coalesce around core values, to develop their own mission statements or sense of purpose and priorities.

Q Their own culture and identity. The left hand quadrant things.

A Right. And now there is interest in bringing some of these groups together. Build It Green is hosting a summit for all the guilds and councils under at its umbrella in the fall of 2006.

Q That sounds like a fairly large undertaking.

A It will be.

Q But you only have marginal involvement with Build It Green yourself?

A Actually I'm involved with most of the councils because many of them evolved from our development and outreach committees in Alameda County. I like to keep track of the issues and objectives for each group so that we can keep our program current and up to date.

Q It is sort of like research for your own Green Building program, just to have the pulse of what is current in those communities and stakeholder groups.

A I also keep an eye out for potential conflicts, because they often arise in groups, especially when groups are in the early formative stage.

Q It sounds like there is some awareness of the developmental process of each stakeholder group or guild, that they have to go through this on their own. And having gone through that in the Alameda County program you can provide a level of mentoring for those to happen.

A Yes. Something like that. But in addition, I think it comes back to the integral perspective, whether we call it integral or not. There are more and more people who are becoming involved in this green building movement, so the leadership of the whole initiative is very dispersed. It is not focused on Green Building in Alameda County or any one organization. It is now spread out among the many people who have become interested and stepped up to the plate. I think it's important to make sure things move forward in an integral way. There are always individuals who are less tolerant or open to other value systems. They can create or exacerbate differences among groups rather than seek integration. So, that is one of things that I look for.

Q Can you describe the figure 6 for me?

integral social network (Build It Green)

Figure 6: AQAL View of Housing Market.

A The way the graph is constructed, if you look at the middle four rings, from production housing out to the eco housing, that's where our green building program has focused. That covers the market transformation program. How are we going to "green" housing in Alameda County? If you look back at our stakeholder analysis and how that led to the green building program then you will see all those different stakeholder groups and the elements of our green building program in those four rings. Then I added in the center to rings of housing types that are "below the market" so to speak. There is no open market for those sorts of things. But they fill in the full picture of what is being built.

Q *So, in looking at all of this, how do you measure success?*

A There are different ways that we measure success. We look at how many of our cities are actively promoting and encouraging green building. We also look at how many people we're attracting to our trainings, and whether have we have been able to engage all the key stakeholders. Maintaining a channel of communication with the production builders is a sign of success. We don't have much quantitative information, such as the number of houses built, at this point. That will come later as the rating program matures. We are seeing success in the left-hand quadrants first, and expect that to show up in the right hard quadrants later (the number of green buildings). Sometimes people get narrowly focused on looking only at the number of buildings.

I think that another gauge would be local capacity building. When we got started there were only a few environmental groups promoting green building—before it was even called green building. Now we're working with realtors, mortgage brokers—people who are involved in a lot of transactions around housing. I think that's a sign of success.

Q *What would be the most challenging thing you're experiencing now in terms of what's going on with the program?*

A The most challenging thing is keeping all of the stakeholders in the fold and fending off the tendency to go to one end of the spectrum or the other. For hard-core environmentalists, we are never green enough. And for some building industry stalwarts we are interfering with the "free" market. The forces of polarization are very strong. In California, we have the whole gamut. We have the most liberal groups that you can find, as well as a very conservative building industry association. I think in other parts of the country, the stakeholder spectrum is not as wide, or it may be weighted towards one end or the other.

Each group has a tendency to do whatever is most comfortable and familiar for them. And there is a time when those strategies are appropriate. For builders it is to focus on the economics, and to fight change. For government it is to regulate. For environmentalists it is to protest and fight industry. It is difficult to hold the space where there is common ground.

Q *Are you hopeful that the work of Green Building in Alameda County and Build It Green will be able to continue holding this common space open and support the sustainable evolution of the building industry?*

A Absolutely! We have our ups and downs, but overall we are seeing more acceptance of green building and increased collaboration.

Q *Thanks for taking the time to share all of this with our readers.*

A Thanks for your interest! It has been a pleasure.

Le Peer to Peer:
Vers un Nouveau Modèle de Civilisation

Michel Bauwens

Abstract: Le « peer to peer » est la dynamique intersubjective caractéristique des réseaux distribués. Le but de cet essai est de montrer qu'il s'agit d'une véritable nouvelle forme d'organisation sociale, apte à produire *et* échanger des biens, à créer de la valeur. Celle-ci est la conséquence d'un nouvel imaginaire social, et possède le potentiel de devenir le pilier d'un nouveau mode d'économie politique, voire d'un nouveau type de civilisation. Pour cela, nous allons d'abord définir le P2P, décrire en bref ces manifestations, et le différencier d'autres modalités d'échange intersubjectif tel que le marché, la hiérarchie, l'économie du don.

Comme principale modalité P2P nous distinguons: Les processus de production P2P, comme troisième mode de production, qui n'est ni géré par un mode hiérarchique ou par l'état, ni répondant à des impératifs de profit ou qui sont modulés par le biais des prix. Les processus de gouvernance P2P, qui gouverne ces processus de production. Les formes de propriété P2P, qui sont destine a empecher l'appropriation prive de cette production pour le commun.

Afin d'examiner les characteristiques de cette nouvelle dynamique sociale, nous utilisons la typologie intersubjective de l'anthropologue Alan Page Fisque, qui distingue: 1. l'échange égalitaire (Equality Matching), c..a.d l'economie du don. 2. La relation d'autorité (Authority Ranking) tel qu'elle s'exprime dans le mode hierarchique. 3. le marché (Market Pricing). 4. la participation commune (Communal Shareholding).

En conclusion, nous examinons les possibilites d'expansion de ce nouveau mode sociale et son insertion dans l'economie capitaliste, en nous nous posons la question: le P2P peut-il etre concu comme alternative sociale et economique aux modeles existants.

Keywords: capitalisme, cognitif, Economie, Internet, Politique, Societe de l'information, Reseaux.

Abstract: "Peer to peer" is hypothesized as a new social formation with intersubjective dynamics characteristic of distributed networks. This is shown to have profound implications for the transformation of our current form of market economy. To demonstrate this, I initially will define P2P, and carefully distinguish it from other modes of production and governance such as reciprocity-based gift economies, markets etc.. Peer to peer dynamics are associated with a series of important processes: Peer production as a third mode of production, peer governance, and Universal common property regimes.

In order to examine characteristics of this new social dynamic, I use the intersubjective typology of the anthropologist Alan Page Fisque, who distinguishes: 1. leveling exchange (Equality Matching), the gift economy. 2. The relation of authority (Authority Ranking) such as it is expressed in the hierarchic mode. 3. The market (Market Pricing). 4. The common participation (Communal Shareholding).

SOME RIGHTS RESERVED

In the end, I look into the possibilities of expansion for this new social formation, which holds great promise for a reform of our polity towards more participation. I conclude the article with an examination of the integrative nature of P2P.

Keywords: Capitalism, cognitive, economy, internet, policy.

Introduction

La plupart des lecteurs sont familiers avec le concept de 'peer to peer' dans le domaine technologique, et spécifiquement, en tant que technologie de base pour le partage de fichiers, et connaissent les nombreuses controverses suscitées par l'échange (en fait: le 'partage') de contenus musicaux et audiovisuels. Notre propre conception du peer to peer, ou 'pair à pair' est bien plus large. Il s'agit en fait d'une dynamique intersubjective caractéristique des réseaux distribués. Le but de cet essai est double, il faut montrer tout d'abord que le peer to peer est une véritable nouvelle forme d'organisation sociale, apte à produire *et* à échanger des biens, à créer de la valeur. Mais nous chercherons également à établir que le peer to peer a le potentiel pour devenir le pilier d'un nouveau mode d'économie politique, voire d'un nouveau type de civilisation. Pour cela, nous allons d'abord définir le P2P, décrire en bref ces manifestations, et le différencier d'autres modalités d'échange intersubjectif tel que le marché, la hiérarchie, l'économie du don.

Définition Préliminaire du P2P

Le P2P est la dynamique humaine intersubjective à l'œuvre dans les réseaux distribués. Un réseau distribué n'est donc pas 'centralisé' (tel que les anciens réseaux téléphoniques), ou même décentralisé (comme le système des aéroports américains, organisé autour de hubs obligatoires). Un réseau distribué peut avoir des nœuds plus importants que les autres, mais ceux-la ne peuvent être obligatoires et n'ont pas d'autorité sur les agents / participants. Des exemples récents sont l'Internet et les *réseaux routiers*. Avec ce système, les agents sont donc autonomes, libres d'agir et de contribuer (et donc aussi: de se retirer, de ne pas participer), et ne sont pas soumis ni contrôlés par une autorité hiérarchique, ni motivés par des signaux économiques comme le 'prix' ou le 'salaire.' Pour que naissent ce type de relation intersubjective, les agents doivent être considérés comme équipotentiels, 'égaux en puissance', ayant la capacité de contribuer sans sélection préalable, et sont généralement unis autour d'un projet commun, 'un objet'. Il s'agit de ce que certains sociologues ont pu appeler une 'socialité orientée vers un objet'

L'émergence du P2P

La définition préliminaire peut paraître abstraite, mais le phénomène s'étend dans tous les domaines de la vie sociale. Le but n'est pas ici de donner une description exhaustive, comme je l'ai fait ailleurs (http://integralvisioning.org/article.php?story=p2ptheory1) mais de donner une idée de son énorme étendue. Il ne s'agit donc certainement pas d'un phénomène marginal, mais bien d'un phénomène émergent et interconnecté qui est caractéristique des secteurs de pointes de la société contemporaine (technologies, échange et production de savoirs).

Le P2P est premièrement la base infrastructurelle du système économique contemporain, c.a.d. du "capitalisme cognitif." L'Internet et le Web sont aujourd'hui la base même de la communication et de la coordination des processus dans les entreprises, ainsi que de la communication du public. Son architecture a été spécifiquement conçue comme un réseau « point a point ». D'autre phénomène liés sont le partage de fichier, par le biais duquel le concept de peer to peer est apparu pour la première fois dans la conscience publique; le 'grid computing,' le réseau mondial sans fil en construction (le Wireless Commons), et bien d'autres. Une nouvelle génération de 'Communicateurs Viraux' permettent de créer des réseaux distribués sans infrastructure préalable: ce sont les ressources supplémentaires de chaque 'participant' qui la créent.

Le P2P est aussi une nouvelle infrastructure médiatique. La Toile – renforcée par les développements connus sous le vocable Web 2.0, et plus spécifiquement les blogs et les wikis – facilite la publication sans intermédiaire industriel; ce phénomène de démocratisation de l'édition et de l'expression créative est également en train de s'étendre au domaine audio, par le biais du podcasting, et même à la vidéo, avec le webcasting. Toute la chaîne de production/publication, de distribution, et de 'consommation /utilisation' a été profondément « désintermédiée » (une nouvelle intermédiation est en train de se faire, mais ne passant plus par les acteurs classiques des médias de masse). Cette nouvelle infrastructure est en partie complémentaire des médias de masse, mais fonctionne aussi comme alternative, par les forces sociales et politiques n'ayant pas accès aux médias traditionnels. Nous sommes entre de plein pied dans l'ere des post-media.

En troisième lieu, et en restant toujours dans le domaine technologique, le P2P est devenue l'infrastructure collaborative mondiale. Il est aujourd'hui possible, avec une grande panoplie d'outils de cooperation, non seulement de produire des biens immatériels, mais aussi de faire du 'design' d'objets matériels, et même de partager (diffuser?) ces derniers, des groupes autonomes de la société civile se montrant désormais en mesure de faire de la production sans l'intermédiaire d'usines ni d'entrepreneurs. Il suffit de jeter un coup d'œil sur la modélisation graphique des 'technologies de coopération' de Howard Rheingold[1] (2003), pour se rendre compte de l'énorme développement et de la maturité de ce nouveau domaine. Pour le grand public, ce sont les outils de la famille Wiki qui sont les plus connus.

Il y a un quatrième aspect fondamental qui n'est pas technologique, mais légal. La General Public License, utilisée par le mouvement du logiciel libre, permet de créer des 'biens publics' qui ne peuvent pas être appropriés par des acteurs privés. Des outils similaires ont été développés pour la création de contenus créatifs, comme l'initiative des licences Creative Commons.

Passons maintenant à un deuxième niveau, celle des pratiques sociales et voyons ce que les processus P2P ont déjà produit. Premièrement, la sphère infrastructurelle elle-même a été créée en très grande partie par des processus de production P2P. L'Internet ne pourrait tout simplement pas fonctionner sans les logiciels libres. Des 'collectifs cognitifs' autonomes et collaboratifs ont créé non seulement des programmes, mais des millions de pages de contenu coopératif, dont le plus connu est probablement l'encyclopédie gratuite Wikipedia. Le deuxième mode de transports aux Etats-Unis, le car-pooling, se fait par le biais de ces mêmes principes. Des centaines de milliers d'internautes partagent leurs ressources informatiques (mémoire, fichiers, etc.) pour des projets d'intérêt public. Notons aussi l' essor du journalisme participatif et citoyen, dans un contexte de déclin généralisé des médias traditionnels. On peut donc bien parler, comme l'a fait déjà Yochai Benkler (2006), d'un troisième mode de production, qui n'est ni géré par un mode hiérarchique ou par l'état, ni répondant à des impératifs de profit ou qui sont modulés par le biais des prix, dans un marché compétitif. Yochai Benkler, par le biais d'une analyse des coûts de transaction et d'information a pu démontrer que lorsque les coûts de départ sont distribués (outillages informatiques de millions d'utilisateurs) ou faibles, les processus de 'peer production' sont en fait plus efficaces que le marché. Cette peer production crée donc des biens publics informationnels, les "Information Commons," et est lie à l'émergence des mouvements politiques de défense du Commun, bien analysés par Philippe Aigrain dans son livre Cause Commune. Il s'agit de tous ces mouvements qui visent à protéger les biens communs contre l'appropriation privée abusive: mouvements contre les prix prohibitifs des médicaments du Sida, protection de la propriété commune des ressources naturelles et contre la biopiraterie, mouvement pour l'accès libre à l'information scientifique, etc.

---

[1] Howard Rheingold and the Cooperation Project. Technologies of Cooperation. May 27, 2006 URL = http://www.rheingold.com/cooperation/Technology_of_cooperation.pdf

Il est clair que tous ces projets de production commune doivent également être gérés. La 'peer production' est donc inévitablement liée à de nouvelles formes de gouvernance: la 'peer governance', dont l'Internet même est un exemple. Quel est aujourd'hui le mouvement politique qui a émergé globalement, qui ne dispose ni de médias classiques et arrive pourtant à mobiliser des centaines de milliers de personnes? C'est évidemment le mouvement altermondialiste. Ces acteurs utilisent principalement l'infrastructure P2P pour s'organiser, et ont adopté des nouveaux principes de gouvernance P2P. Contrairement à d'autres mouvements politiques du passé, ces aspects 'égalitaires' n'ont pas diminué, mais se sont renforcés au travers des années. Des observateurs on également noté que les nouvelles luttes sociales, prennent la forme de 'coordinations.'[2] Implicite dans les nouveaux formats politiques est le refus de la 'représentation', c.a.d. de la délégation permanente du pouvoir.

Le P2P possède également des aspects 'culturels' très marquants, ce qui constitue un troisième niveau, représentant une nouvelle subjectivité et des nouvelles constellations de valeur. L'aspect le plus connu en est celui des nouvelles attitudes de travail, telles que les a décrites Pekka Himanen dans son livre sur "L'éthique des Hackers." Moins connu du grand public, on trouve aussi une évolution des pratiques religieuses et spirituelles, visibles là où les vérités pré-établies sont rejetées, ainsi que les formes autoritaires d'organisation qui les véhiculent (par example le format hierarchique de l'Eglise Catholique). Nombreux sont déjà les 'peer circles,' spécialement parmi les mouvements néopaiens, un phénomène des grandes villes occidentales, mais qui est également perceptible dans d'autres traditions. Il s'agit aujourd'hui de développer une 'spiritualité contributive et participative' à travers des communautés de 'pairs', et non de suivre des traces établis de façon autoritaire.

Quelques Clarifications et Caractéristiques Importantes

Les processus P2P sont essentiellement liés à des pratiques de participation 'maximale.' A partir de la création des sociétés de classe inégalitaires on pourra décrire l'histoire de la civilisation humaine comme une histoire de la participation. Nous citons John Heron:

1) civilisation inégalitaire sans participation dans le domaine du pouvoir politique

2) civilisation sur base d'égalité formelle qui accepte la participation politique grâce à un système de représentation

---

[2] La forme politique de la coordination. Maurizio Lazzarata. 9 juin 2004. URL = http://multitudes.samizdat.net/article.php3?id_article=1446

3) processus d'élargissement de la participation dans divers autres domaines. C'est évidemment la phase actuelle.
4) Ce vers quoi l'évolution sociale devrait tendre si les processus P2P deviennent dominants: civilisation participative généralisée basée sur la création du Commun et sur la participation équipotentielle de tout un chacun [3]

Il peut donc y avoir bel et bien des pratiques hiérarchiques dans les processus P2P, mais l'important est alors de savoir si l'existence d'éléments hiérarchique est employée pour promouvoir la participation, ou pour consolider l'existence d'une élite permanente. Par exemple, si un groupe de PDG crée un réseau collaboratif, il est probable que le processus a pour but de renforcer le pouvoir mutuel, non de l'ouvrir à une participation équipotentielle de tout un chacun. Par contre, les éléments hiérarchiques tel que le système d'adresse DNS, ou l'emboîtement hiérarchique des couches de protocole TCP/IP, ou le modèle client/serveur du Web, n'élimine pas la participation généralisée, mais la rend possible.

L'élément d'équipotentialité est crucial pour comprendre les processus P2P. Dans les processus sociaux modernes, la connaissance est en quelques sorte démocratisée, mais en même temps elle est aussi soumise à des processus de validation institutionnalisée. Participent à des projets ceux dont la connaissance et l'expertise a été validée préalablement. Par exemple, pour écrire dans une revue scientifique, on doit démontrer son expertise formalisée par un diplôme, faire référence à ses écrits préalables, puis être jugés par des pairs. Dans les nouveaux processus de création de connaissance P2P, il n'y a pas de sélection préalable, pas de restriction aux 'membres' de l'institution. La participation est ouverte, et c'est dans le processus de coopération même, que le triage se fait 'à posteriori.' Généralement, les processus de création de valeur d'usage, comme le logiciel libre, sont donc ouverts à tous, à condition que l'équipotentialité soit présente, c.a.d. la capacité de coopérer dans ce contexte spécifique. Ainsi aussi, la Wikipedia est ouverte à tous.

A l' University of Openness une application très radicale des principes P2P qui est avant tout basée sur l'échange de savoir, et sur la recherche de savoir en commun, tout un chacun peut créer une faculté, devenir un étudiant de cette faculté,etc. Les facultés disposent également d'une bibliothèque coopérative et diffuse, c.a.d. les livres de chacun mis à la disposition de tous. La validation est communautaire, se fait par le biais de l'intelligence collective dont dispose la communauté (et dont les membres sont informés également par les autres modes de validation institutionnelle). Notons que la participation à des projets P2P peut être automatique: l'option par défaut devient alors la participation, et les ressources individuelles sont considérées comme communes 'à priori.' C'est la non-participation qui apparait donc comme élective. Par exemple, dans l'échange de fichiers, la participation est impliquée par la mise à disposition de sa propre mémoire dans le réseaux; concernant la méthode de diffusion à bande large BitTorrent, toute personne téléchargeant un fichier partage automatiquement ses propres ressources non utilisées. Les processus de P2P pratiquent donc en général des procédés de capture automatique, ainsi de nombreuses petites ressources distribuées font-elles naître des méga-projets, dépassant de loin les capacités de mobilisations des entreprises, même multinationales.[4]

[3] Communication personnelle avec John Heron, July 2005

[4] La typologie de Alan Page Fiske

People use just four fundamental models for organizing most aspects of sociality most of the time in all cultures. These models are Communal Sharing, Authority Ranking, Equality Matching, and Market Pricing. Communal Sharing (CS) is a relationship in which people treat some dyad or group as equivalent

Dans quelles mesures les processus P2P peuvent ils être distingués de la socialité de réseaux, tel que décrite par Manuel Castells (2001)? Cet auteur ne distingue pas clairement les différents types de réseaux, et nous rappelons que les processus P2P sont caractéristiques des réseaux *distribués*. Prenons l'exemple de Marx observant la naissance du modèle industriel: il aurait pu décrire uniquement les usines, les relations autoritaires à l'intérieur de l'usine. Mais en même temps, les ouvriers créent une nouvelle culture de résistance, des coopératives, mutualités, syndicats et partis politiques populaires. Ces dernières pratiques ont durablement changé la société capitaliste et créé un modèle dans lequel l'économique a été, en tout cas pour un temps, soumis à des priorités sociales (le modèle social Européen ou Rooseveltien). L'approche P2P ne se contente donc pas d'analyser la socialité générale de notre société en réseaux, mais les processus spécifiques qui ont une intentionnalité participative, qui sont une réaction, une résistance et une création sociale vis à vis de la socialité de réseaux généralisée. L'objet des processus P2P est implicitement et explicitement de créer du Commun, et non du marché ou de l'état.

Il faut donc distinguer nettement les processus participatifs purs, résultant dans la création du Commun, de processus qui 'emploient' l'infrastructure P2P, mais tentent de l'approprier dans

---

and undifferentiated with respect to the social domain in question. Examples are people using a commons (CS with respect to utilization of the particular resource), people intensely in love (CS with respect to their social selves), people who "ask not for whom the bell tolls, for it tolls for thee" (CS with respect to shared suffering and common well-being), or people who kill any member of an enemy group indiscriminately in retaliation for an attack (CS with respect to collective responsibility). In Authority Ranking (AR) people have asymmetric positions in a linear hierarchy in which subordinates defer, respect, and (perhaps) obey, while superiors take precedence and take pastoral responsibility for subordinates. Examples are military hierarchies (AR in decisions, control, and many other matters), ancestor worship (AR in offerings of filial piety and expectations of protection and enforcement of norms), monotheistic religious moralities (AR for the definition of right and wrong by commandments or will of God), social status systems such as class or ethnic rankings (AR with respect to social value of identities), and rankings such as sports team standings (AR with respect to prestige). AR relationships are based on perceptions of legitimate asymmetries, not coercive power; they are not inherently exploitative (although they may involve power or cause harm).

In Equality Matching relationships people keep track of the balance or difference among participants and know what would be required to restore balance. Common manifestations are turn-taking, one-person one-vote elections, equal share distributions, and vengeance based on an-eye-for-an-eye, a-tooth-for-a-tooth. Examples include sports and games (EM with respect to the rules, procedures, equipment and terrain), baby-sitting coops (EM with respect to the exchange of child care), and restitution in-kind (EM with respect to righting a wrong). Market Pricing relationships are oriented to socially meaningful ratios or rates such as prices, wages, interest, rents, tithes, or cost-benefit analyses. Money need not be the medium, and MP relationships need not be selfish, competitive, maximizing, or materialistic—any of the four models may exhibit any of these features. MP relationships are not necessarily individualistic; a family may be the CS or AR unit running a business that operates in an MP mode with respect to other enterprises. Examples are property that can be bought, sold, or treated as investment capital (land or objects as MP), marriages organized contractually or implicitly in terms of costs and benefits to the partners, prostitution (sex as MP), bureaucratic cost-effectiveness standards (resource allocation as MP), utilitarian judgments about the greatest good for the greatest number, or standards of equity in judging entitlements in proportion to contributions (two forms of morality as MP), considerations of "spending time" efficiently, and estimates of expected kill ratios (aggression as MP). (source: Fiske website http://www.sscnet.ucla.edu/anthro/faculty/fiske/relmodov.htm).

l'économie marchande. Ainsi, l'ensemble du capitalisme cognitif repose aujourd'hui sur l'infrastructure communicationnelle P2P; les processus collaboratifs intra- et inter-entreprises seraient impossibles sans leur emploi; certaines entreprises, que nous appelons 'netarchiques' reposent explicitement sur la facilitation et l'exploitation des processus participatifs, tel que Amazon, Google, eBay etc. L'idéologie du 'Bottom of the Pyramid development,' visant à une extension du marché vers les tout pauvres, est en quelque sort inspire par certains principes P2P. Plus loin, nous développerons les différences entre les processus P2P et le marché.

Récapitulons Quelques Principes Supplémentaires:

- le P2P n'est pas sans structure, mais possède des structures dynamiques et changeantes, selon les différentes phases de constitution d'un projet.
- le P2P n'est donc pas sans 'autorité' mais l'autorité y est dynamique, fonctionnellement spécialisée, souvent avec un leadership collectif, gardien des valeurs et de la vision du projet, mais dont l'influence dépend de l'engagement concret. L'hierarchie 'volontaire' est en general constituee d'un leadership ideologique et historique, c.a.d. les 'concepteurs' du projet, et d'un leadership de competence meritocratique.
- la communication n'y est pas formalisée dans des processus de haut en bas et réciproquement, mais y est intégrée aux 'protocoles' même du système.
- La coopération doit être libre et non forcée, et soit le retrait, soit le 'forking', la création d'un nouveau projet, doit être possible à tout instant.
- Si les systèmes hiérarchiques sont caractérisés par le panoptisme, autrement dit la capacité réservée à la hiérarchie de voir le système dans son entièreté; les processus P2P sont caractérisés par l'holoptisme, lequel signifie la capacité de chaque membre de voir le tout, aussi bien horizontalement (avec les autres participants), qu'avec le développement du système dans son entièreté. La transparence est inscrite dans le protocole même et accessible par les outils informatiques et la communication libre. Ces qualités sont exprimées dans des 'collectifs cyber' reposant sur une collaboration globale. Notons que la qualité d'holoptisme nous permets de distinguer le P2P des processus sociaux des insectes, où les participants n'ont pas cette capacité, et peuvent être sacrifiés au système; cette même qualité permet de distinguer le P2P des processus marchands, dans lesquels les individus n'ont pas accès à la connaissance du système dans son entièreté ,et sont seulement engagés dans leur propre transaction.

Si il n'y a pas à proprement parler de hiérarchie, de structure ou d'autorité fixe dans les processus P2P, où est donc le pouvoir? Le pouvoir est dans la communauté, et cette communauté est non-representationelle. Elle refuse donc de déléguer ces pouvoirs. Ce que ces processus participatifs veulent éviter, c'est l'émergence d'un « individu collectif » dans le sens de Louis Dumont, qui peut se détacher des participants (tel l'entreprise ou la nation), et acquérir ses propres stratégies de pouvoir, éventuellement à l'encontre de ces propres membres. En éliminant ainsi les signaux de la hiérarchie et du marché, les projets Communs ont besoin de signaux qui doivent venir des relations sociales elles mêmes. Il y a donc la validation communautaire par le biais de multiples techniques d'auto-évaluation permanente; il y a l'invention de protocoles technologiques indépendants, qui vont tenter d'objectiver cette validation, par exemple, le protocole de Technorati.com qui permets de distinguer les entrées de blogs à partir de leur utilité démontrée par l'usage réel. Ce sont le résultats des ces algorithmes qui vont fréquemment faire un arbitrage 'objectif'.

Notons finalement le processus de dé-marchandisation. Les projets communs produits par le biais des processus sociaux P2P, ne sont généralement pas destinés à la vente, il ne s'agit pas de 'produits' proposés à un marché. Ils sont faits pour leur valeur d'usage. L'usage qui en est fait est lui-même le principal outil pour déterminer la valeur d'un projet et des protocoles informatiques peuvent être utilisés pour la mesurer.

Pour qualifier de processus 'peer to peer', nous pensons qu'il est justifié d'y ajouter une caractéristique morale, une 'intentionnalité', qui doit être celle de la participation et de la création du Commun. En effet il est possible de créer des projets collaboratifs fermés à la participation, et il est également possible de produire des produits sans viser de mettre la valeur d'usage en Commun. Il y aujourd’hui un nombre de sites ou des firmes privées qui rémunèrent les meilleures solutions à certains de leur problème, même si le processus de production de ces solutions est le fait de 'collectifs cyber' en compétition, comme l'intentionnalité est ici de 'vendre' la solution, cela peut être au plus un procédé 'partiellement P2P.'

Le P2P et les Autres Modes Intersubjectifs

Afin de pouvoir distinguer cette nouvelle formation sociale d'autres modes intersubjectifs de création et d'échange de valeurs, nous employons la typologie de l'anthropologue Alan Page Fiske.

Il distingue quatre types de relations intersubjectives: 1) l'échange égalitaire (Equality Matching); 2) la relation d’autorité (Authority Ranking); 3) le marché (Market Pricing); 4) la participation commune (Communal Shareholding).

Notons que toute civilisation est un mélange de ces quatre types d'intersubjectivité, mais qu'en général, un mode domine et 'modèle' les autres. Ainsi, le mode tribal a été identifié avec la dominance de l'échange égalitaire, ou l'économie du don. La société tribale est dominée par l'appartenance à la lignée, et les liens y sont crées par le biais du don. Le don crée obligation et lien social.

Les civilisations agricoles ou féodales sont dominées par le principe d'autorité ou d'allégeance et possèdent une économie tributaire basée sur la relation de force. Aujourd'hui le mode capitaliste est évidemment dominé par l'échange via le marché et le lien salarial, qui est une relation de dépendance.

Notre hypothèse est donc que le peer to peer représente une nouvelle formation sociale base sur la participation commune.

Voyons en quoi cette nouvelle formation sociale diffère des trois autres modes, et pourquoi il s'agit d'un mode de 'participation commune.'

Premièrement, le P2P n’est pas basé sur une réciprocité directe. Il n’y a pas d’échange. La production dépend essentiellement de la volonté de chacun de vouloir participer dans le projet commun. Pendant le processus, il n’y pas de processus de dépendance car il n’y a pas de salaire. L’utilisation de la production commune est encouragée, et chaque nouvel utilisateur est en fait une ressource pour le système. Il n’y a donc pas de Tragédie du Commun, dans le sens ou il ne peut y avoir sur-utilisation du système. Finalement, le produit final est un bien commun qui est mis à la disposition de tous. C’est donc bel et bien un système de non-réciprocité et toutes les analyses qui veulent faire de l’internet une économie de don sont erronées.

Deuxième point: le P2P n’est pas un marché. Il n’y a pas de relation salariale et de commande hiérarchique, car il n’y a pas d’entreprise. Les produits ne sont pas vendus sur le marché (bien que cela soit permis par les licences) et, puisqu’il n’y a pas de tension entre l’offre et la demande dans le contexte d’un bien infiniment reproductible, il n’y pas de régulation par les prix. La production P2P ne produit pas de marchandise.

Ceci ne veut pas dire que le P2P n’est pas profondément impliqué dans l’économie de marché. Pour les entreprises, l’utilisation de logiciel libre est un moyen de fortement diminuer les coûts; ces mêmes entreprises sont à l’affût de l’innovation ainsi générée, et peuvent même financièrement soutenir des projets. Tout simplement, l’économie cognitive ne pourrait fonctionner sans l’appui des technologie P2P (l’internet, le web), sans l’innovation diffuse, sans les techniques participatives dans le management des projets. Les processus participatifs créent une nouvelle sphère du capitalisme, une nouvelle fraction du capital qu’on pourrait appeler ‘netarchique.’ Il s’agit d’entreprises dont la valeur ne dépend ni de leurs ressources matérielles (comme dans le capitalisme industriel), ni de leurs ressources intellectuelles (comme dans le capitalisme cognitif), mais de leur capacité à créer des plateformes participatives (Ebay, Google, Yahoo, Amazon) ou d’agencer l’apport de la participation dans l’enrichissement des services et produits.

Les deux erreurs d’interprétations sont donc de considérer la peer production comme une expression du marché, ou de ne voir que les aspects ‘immanents’ du phénomène P2P, sans en voir les aspects transcendants, les aspects qui dépassent le marché et l’économie politique du capitalisme.

Le P2P a donc une double nature: par le biais de son infrastructure informatique distributive et collaborative, il est instrumentalisé par le capital. Mais le P2P ne peut se réduire à cette instrumentalisation. Elle est une initiative du monde civil pour sortir de la dichotomie marché-etat, offrant un troisième mode d'organisation sociale.

En effet: 1) cette même infrastructure renforce l'autonomie du monde civil; 2) son mode de production ne répond ni à des impératifs de marché, ni à une hiérarchie étatique ou corporative; 3) son mode de gouvernance non hiérarchique se sépare de celui des entreprises, mais aussi du mode étatique; 4) Sa mise en commun de la propriété intellectuelle rend impossible l'appropriation privée et crée un 'troisième domaine social.'

Le P2P changent également profondément la relation hiérarchique. Le P2P est méritocratique et n’est plus basé sur la relation de dépendance du régime salariale mais plutôt sur un leadership distribue et changeant. L’identité, la réputation de l’individu y dépendent de sa contribution au commun et de la reconnaissance de cet apport par la communauté. Le grand choix de l’individu est désormais: de suivre un projet existant avec un leadership déjà constitue (même s’il est mouvant et changeant), ou de créer son propre projet.

L'extension du Mode P2P Dans le Monde de Demain

Nous voulons ici réfléchir à une extension possible du mode P2P, et de son articulation présente et future dans la société. Il serait faux de réduire l’extension du P2P au domaine de l’immatériel.

L’extension des modes participatifs sont une fonction des réseaux distribues, donc d’une extension des processus de distribution. La distribution de l’intellect tout d’abord. Le P2P est fonction de l’abondance d’intelligence collective, et de son surplus qui ne peut être réduit à son emploi dans l’entreprise par le biais de la relation salariale. Toute extension générale du niveau de l’éducation, des moyens mis dans la recherche et l’innovation, sont favorables à son extension.

La distribution des moyens de productions, du capital fixe ensuite. Dans la mesure ou les ordinateurs et les réseaux continuent leur expansion, les possibilités de capitalisation distribuées, c’est à dire la création de réseaux sans apport de capital centralisé, augmentent. L’explosion que nous voyons aujourd’hui dans la sphère médiatique, pourrait se produire dans certains secteurs de la production matérielle, selon les progrès de la ‘desktop manufacturing’ (‘production chez soi’), qui vient de démarrer aux Etats-Unis, avec des entreprises de support tels que eMachineShop.com, iFabricate.com, etc. En outre, partout ou la production peut être distinguée en deux phases, immatérielles et matérielles, la possibilité théorique d’une extension du participatif existe dans la phase de conception des produits et services. C’est évidemment déjà le cas dans le secteur des logiciels, ou de nombreuses entreprises de service, capitalisent sur les logiciels libres.

La distribution du capital financier ensuite. C’est le facteur le plus délicat et difficile à envisager, puisqu’il y a une extraordinaire concentration des ressources dans ce domaine. Cependant des nouveaux mécanismes comme la Banque ‘P2P’ Zopa, un système bancaire sans intermédiaire, pointent vers les solutions futurs.

Le développement de la sphère non-reciprocité pure sera aussi dépendante d’une série de mesures politiques, tels que le revenu universel garanti. Une telle politique, qui permet de sevrer le lien trop direct entre travail et salaire, permettra à de nombreuses personnes de rejoindre, pendant des tranches choisies de leur vie, des projets de production participatives en dehors de la sphère marchande. C’est probablement la mesure la plus importante pour enrichir durablement nos sociétés.

Recapitulatif: Les Aspects Integraux et Integratifs du P2P

Les processus P2P sont donc généralement associés à une production de valeur, la 'peer production.' Ces processus P2P n'ont pas comme finalité le profit, mais la valeur d'usage. Pourquoi ce mode peut-il être considéré comme intégratif par rapport à la situation précédente? Autrement dit, le P2P est-il régressif, ou, au contraire, reprend-il les avantages des modes précédents, tout en les améliorant ?

Le P2P est tout à fait compatible avec un mode de production industriel et post-industriel, et est même plus productif que celui-ci dans certaines conditions. Le P2P n’abolit donc pas la complexité du monde économique. Il n’est en aucun cas, un retour en arrière. Il permet en fait à l’économie du marché de profiter de son innovation et de son extension. Nous avons également insisté sur le fait que la vocation du P2P n’est pas d’exister seul, mais de devenir le format ‘dominant’ dans une nouvelle configuration qui englobe les quatre modes intersubjectifs.

Comme il s’agit ici d’une hypothèse sur le futur, nous ne pouvons qu’offrir une réflexion. Nous avons développé ailleurs trois scenarios. Dans le scenario ‘négatif,’ le P2P est entièrement instrumentalisé par le modèle dominant. Les dispositifs propriétaires y sont renforces, mais la propriété physique y est remplace par des formes de propriété basées sur des licences (abonnement, location de services). Dans ce scenario, décrit par Jeremy Rifkin (2001) dans The Age of Access, il y a perte de liberté d’usage, car les licences sont beaucoup plus restrictives que la propriété matérielle, et limitent l’usage que l’on peut faire de la production immatérielle. Pour réussir, il faut créer une rareté artificielle, par le biais d’une législation renforce sur la Propriété Intellectuelle, et par l’intégration de logiciels de contrôle empêchant la reproduction de la matière première digitale. C’est évidemment le scénario soutenue par Microsoft et l’OMC, qui détruirait le Commun. Il s’agit d’une forme de ‘féodalisme informationnel’ tout à fait réactionnaire car il détruit les possibilités productives et la création culturelle du nouveau système. En plus, il crée une dichotomie, une nouvelle inégalité entre ceux qui auront accès aux réseaux et aux licences, et ceux qui en seront exclus.

Deuxième scénario: la cohabitation pacifique entre le système économique dominant et la sphère P2P. Un modèle historique en serait la cohabitation entre la sphère commune des paysans aux Moyen-Age, ainsi que l’existence d’une Eglise disposant de ses propres domaines avec une forme de propriété collective, et le système féodal. Dans la Sangha bouddhique de l’Asie du Sud-Est, nous voyons comment l’on peut se mouvoir de la sphère féodale (et aujourd’hui: marchande) vers la sphère monacale, comme font aujourd’hui les programmeurs entre leur travail pour les entreprises et leur production libre. C’est donc en effet la situation actuelle mais elle est, selon nous, instable, car nous ne voyons pas comme un système qui détruit sa propre base productive, c’est à dire la biosphère elle-même, peut durer indéfiniment.

La question essentielle est ici la survie du marché sous la forme ‘capitaliste.’ En fait, la situation nous parait être la suivante: il y a abondance immatérielle (c’est la sphere du P2P ‘pure’); il y a abondance dans l’appareil productif (le modèle industriel nous permets de produire à outrance), mais il y a limitation des ressources naturelles Les reformes proposées par les adhérents du courant du capitalisme ‘naturel,’ c.a.d. Paul Hawken (2000), David Korten (2000), Hazel Henderson (1995) pourraient constituer une piste alternative. Celles-ci vont dans le sens d’une obligation d’intégrer dans le système économique les coûts d’externalisation par rapport à l’usage de la biosphère. Nous devons arriver soit à une économie à croissance zéro (décrite par l’économiste Herman Daly (1997) concernant cet usage de la biosphère (et dans un esprit d’équité, à une décroissance en Occident, décrite par l’économiste Serge Latouche (2004)). Le deuxième aspect important est l’intégration des coûts sociaux, des couts d’une reproduction sociale qui ne réduit pas des milliards d’êtres humains à la misère.

La première priorité renvoie à une attitude participative envers la nature, ce qui fait partie d’un changement dans les constellations de valeur dans le sens du P2P; la deuxième renvoie à une intégration de la gouvernance humaine dans les processus économiques. Nous devons donc imaginer un futur ou le marché lui-même est informe par les principes P2P. Prenons exemple du commerce équitable. Ici, le marché est extrait de la pure sphère du pouvoir, et les nouveaux intermédiaires négocient avec les producteurs pour connaitre leur besoin en terme de reproduction sociale digne. Ces demandes sont alors compare à ce que le marché peut ‘porter.’ Le résultat: les consommateurs payent un peu plus, les intermédiaires gagnent un peu moins, mais les producteurs gagnent mieux et dignement leur vie. Ceci parce que le marché est ici ‘in-formé’ par ce processus de négociation participative. Le marche est soumis a un processus d’arbitrage P2P.

Poursuivons notre démarche de questionnement ‘integratif’ du P2P. Nous avons démontré les aspects intégraux de la production P2P. Quand est-il de la gouvernance ? Cette gouvernance est bien plus démocratique et efficace que les modèles précédents, mais ceci sans abolir les bienfaits de la démocratie représentative. Au contraire, la participation, jusqu’ici limite au vote, est généralisée, puis étendue vers les sphères non-politiques, comme la production de valeur économique, et vers la culture, par le biais de la production autonome post-médiatiques.

Quand est-il du mode de distribution P2P, c.a.d. les biens communs informationnels ? En effet, les 'produits' sont rarement vendus sur le marché mais sont la plupart du temps mis gratuitement à la disposition des utilisateurs et du public, sous des formes propriétaires nouvelles, de 'bien public' ou 'bien communautaire,' "non-étatiques." Il s'agit ici d'un nouveau mode de propriété, la 'peer property,' qui est ni celui de la propriété privée (et donc exclusif et privatif), ni collectif et étatique (où l'individu est 'soumis' aux impératifs de l'état ou de la collectivité), mais commun (tous les individus y ont un droit égal). Ce nouveau mode n'abolit pas la propriété privée ou étatique, mais en ajoute un troisième qui reconnaît l'apport individuel (donc un des aspects clefs de la propriété prive), tout en transformant la notion du collectif transcendent (la propriété étatique qui externalisent la propriété commune), en 'commun immanent.' Les deux plus importants aspects des nouveaux modes de propriété commune sont donc 1) l'attribution individuelle; et 2) le concept du 'share-alike.' qui est l'obligation de continuer à mettre à la disposition du public tout travail d'amélioration.

Le P2P est en outre une avance considérable dans l'interrelation entre l'individu et le collectif. Une des caractéristiques de la prémodernite est la vision holistique ou l'individu n'existe que par la collectivité. La modernité invente l'individualisme, mais aux prix d'une atomisation de l'individu. Dans le peer to peer, nous retrouvons entièrement l'individu libre, mais conçu dans son interconnexion avec les autres. Rien n'est perdu de l'individualisme, mais on réintègre l'aspect relationnel constitutif de l'être humain, par le biais du commun. La fragmentation postmoderne de l'individu retrouve une integration par le projet des projets communs.

La où l'universalisme de la modernité faisait table rase des différences, le commun participatif les reconnaît pleinement. Tous les mécanismes communs des processus P2P ont pour but d'empêcher la création de groupes transcendants au dessus de la communauté vivante des producteurs.

Quand est-il des aspects 'négatifs' de l'émergence des processus P2P ? Ils se trouveront probablement dans ses problèmes d'apprentissage, surtout au niveau de la gouvernance. L'absence de structure claire peut parfois cacher des structures de pouvoir. Il y a toute une problématique d'appropriation privée qui reste entière. Que faire de l'appropriation par des entreprises de tout ce travail en commun ? Doit-il profiter à toute la communauté ? Comment les processus de gouvernance autonome peuvent-ils s'intégrer dans la structure de pouvoir existante? Certains protocoles communautaires ne risquent-ils pas renforcer la médiocrité, plutôt que le génie individuel ? Le chantier du P2P est donc ouvert et nous allons découvrir non seulement ses bienfaits, mais les nouvelles problématiques et tensions que son émergence engendre.

Le Peer to Peer:
Vers un Nouveau Modèle de Civilisation
Peer to Peer: Towards a New Model of Civilization

Michel Bauwens

English Summary

This article presents and summarizes a hypothesis about the birth and emergence of a new social formation, called "peer to peer," which has profound implications for the transformation of our current form of market economy.

Peer to peer is the intersubjective dynamic at work in distributed systems, i.e., a type of network that goes beyond decentralization, because hubs are no longer obligatory, thereby giving an unprecedented amount of control to the agents involved. Such peer to peer dynamics are associated with a series of important processes:

- Peer production, as a third mode of production, where decisions do not arise from market allocation or corporate management, but arise from the free cooperation of producers. It is mostly associated with the production of free and open source software, but is expanding to the totality of the immaterial sphere and even beyond.
- Peer governance, as the new methods of governance that are being experimented with in these kinds of projects.
- Universal common property regimes: the resulting use value is not sold on the marketplace for its exchange value, but is freely available to those who need it.

The precise characteristics of peer to peer (P2P) processes are described (such as its holoptism, anti-credentialism, etc.), and it is carefully distinguished from other modes of production and governance such as reciprocity-based gift economies, markets, etc. P2P is identified as a modern form of 'Communal Shareholding,' following a comparison with anthropological models of intersubjectivtiy, i.e., the relational models proposed by Fiske.[1]

The fourfold intersubjective typology of Alan Page Fiske distinguishes:

1) Equality Matching, where individuals make sure that reciprocity occurs, and that was the basis of the tribal gift economies, and where the key question was 'to belong or not to belong.'
2) Authority Ranking, where individuals are ranked according to priority, which was the basis of agriculture-based feudal-type civilizations.
3) Market Pricing, where goods and services are exchanged according to a pricing mechanism, the basis of the capitalist economies.
4) Communal Shareholding, whereby resources are held in common, each contributes according to willingness and ability.

SOME RIGHTS RESERVED

In the last part, we look into the possibilities of expansion for this new social formation, which holds great promise for a reform of our polity towards more participation. I conclude the article with an examination of the integrative nature of P2P.

Perspectives On Troubled Interactions: What Happened When A Small Group Began To Address Its Community's Adversarial Political Culture

Sara Ross

Abstract: This study investigated fostering political development (as defined in the report) through an integration of adult development, public issues analysis, and structured public discourse. Entitled The Integral Process For Working On Complex Issues (TIP), that multi-session discourse methodology includes issue analysis and framing, deliberation, and organizing systemic action. Its issue-framing template helps users generate multiple approaches to issues that reflect different levels of complexity and incorporate the conceivable human and institutional perspectives and environmental life conditions. The small group used the discourse process to select a public issue of concern and to begin to address it. It was about how to change the community's adversarial political culture. They conducted a deliberative action inquiry into their own tones and intentions toward that issue as the starting point to address it, and did deliberative decision-making on that basis. The political reasoning and culture of the group developed during the study, evidenced by the group's work and changes that participants experienced. The study is the first of its kind in several respects, which are: (a) to use this public discourse process as part of the research methodology, (b) to perform this kind of empirical research on public discourse and deliberation, and (c) to foster political and adult development while addressing complex issues. This extended length research report departs from traditional journal article formats not only by its length but also by integrating its report of findings with analyses of the processes that resulted in the findings. It is complemented by a shorter article in this issue of *Integral Review*, which describes the steps of the process and the major themes evident in participants' experience.

Key words: action inquiry, adult development, hierarchical complexity, perspectives, political culture, political development, transformative learning.

Introduction

Unexpected, instructive, and transformative things happened when a small group of citizens decided it wanted to begin to address its community's chronically troubled interactions between citizens and local government, and between groups of citizens. Participants in this study used six sessions of a structured public issue discourse process to investigate the roots of the issue, discover and work with priorities, and deliberatively weigh the powerful roles their own tones and intentions would play in any efforts to address the overall issue.

In this first detailed report of findings from the recent study, I aim to tell a "whole story" in such a way that a variety of people may notice at least a few places where this research—and the ideas and praxis behind it—could offer something relevant and interesting to their own endeavors. That variety of people could range from individuals interested in personal and interpersonal development, to various kinds of consultants, change agents, and practitioners including those in deliberative democracy, to theorists and action researchers, to public officials, administrators, and policy makers.

My focus in this report is on what happened in connection with participants' experiences with the issue they worked on during the process. This extended report includes theory, praxis, and analysis. Praxis involves the process of surfacing a unique public issue about attitudes toward—and strategies for—social change, and the small group and individuals' experiences of beginning to work on the issue. Narrative descriptions and qualitative analyses explore what happened with the issue, with the group, and with the individual participants. To support my effort to convey what happened in terms of its whole story, I include a substantive theoretical section before that reporting begins. I believe that readers who wish to skip over that section will glean interesting things from the rest of the story.

The purpose of the study was three-fold: (a) to find out what changes, if any, participants experienced that could be associated with participation in the structured public issue discourse process; (b) to learn about the issue that participants would select, analyze, develop, and deliberate during the process; and (c) to study what happened within the political culture of the small group of participants.

As the method to organize this report, it has the following framework. It begins with a background section in two parts: one that discusses the larger context of the research, followed by one that discusses my research interest and situates it in relation to the literature. That discussion identifies both the void to which this study begins to respond and the research questions posed for the study. The second section discusses the theoretical perspectives underlying the study's methodology and the report of findings. That section serves as an overview of the fields, key theories and areas of praxis. It includes discussion of developmental dynamics in relation to the methodology. Building on those foundations, that second section has a subsection related to the political importance and implications of the study participants' issue. This entire second section provides a foundation for understanding the study as a whole from an applied-theory standpoint. It also enables me to be more efficient in discussing the findings later in the report.

In the third section, the report on the study begins by introducing my research perspective and information about the study participants and data collection methods. It provides a brief overview of the project's design to orient readers for the rest of the section. In this part, my discussion has two major levels of reporting: one at the group level, and one at the level of individual participants. The group level reporting follows the chronological sequence of the discourse process methodology. Its subsections discuss what happened in each group session, generally using the same pattern: introductory description of a session, a report on its work and dynamics, and usually some reflective or theoretical analysis. Analyses of what happened at the group level close that reporting before shifting the focus to the individual participants. The subsection that reports on what happened for participants includes brief, individual portraits of some of their experience and various qualitative analyses. (This section does not report on the two major themes that showed up in participants' experiences; those are reported in the shorter, companion article in this issue of *Integral Review*.) After a summary discussion of the study, the report ends with describing the study's limitations, recommendations for further research, and my conclusion.

Background

Larger Context of the Study: Political Development

This research reflects the junction of long-term interests I have pursued in tandem. One is putting into use systematic methods to address complex public issues, including conflicted ones, so that their component layers can be addressed systemically, and another is supporting individuals' personal development and communities' socio-political development. These reflect my commitment in research and praxis to fostering political development.[1]

Consistent with the dictionary and Stephen Chilton (1988, 1991), I define *politics* as all our ways of relating to others, to groups, to formal and informal institutions, and (unlike Chilton or the dictionary) to the environment. Chilton defines political development in terms of the political culture, comprised of the publicly common ways of relating. In his theoretical work, he writes, "*Political development is defined in this work as a specific form of change in the political culture of a society.* The political cultural system, not the individual or social systems, is the locus of development" (Chilton, 1988, p. 28, emphasis in the original). The first conditions of political development, then, are the human adaptive capacities for increasingly more competent, principled, and appropriate publicly common ways of relating.

Existing political cultures need to develop beyond their present stages of effectiveness in order to address systemic, interrelated issues at all. As that is long-term change, it is important to begin work sooner rather than later to change the political cultures that support and sustain challenging—and often quite troubling—issues. Complex issues are not "things" in themselves that exist independent of the dynamics that give rise to them. They are better understood as *complexes*, metasystems made up of the complicated, interacting dynamics of multiple other systems. Individuals and groups, social institutions, and their cultures play interactive roles in all social issues; thus, they are instrumental actors in efforts to address issues.

Chilton (1988, p. 14) writes, "Locating political development in the cultural system admits several sources of change: change due to cognitive-developmental forces; change due to social inertia; and change due to hegemonic control over available cultural alternatives." According to my reasoning, it follows, then, that if:

---

[1] Most often in the political science and international development literature, where the term *political development* is used, it refers to institutions. My use of the term includes institutions but is not confined to them. Therefore, I refer to and discuss only Chilton's work with regard to political development because we share the same orientation.

1. structured public issue analysis and discourse can foster participants' individual development while and by addressing complex issues of concern, and
2. thus alter social inertia by actively addressing those issues, and
3. the discursive processes lead to new politics by both the nature of the processes and new systemic approaches to action and institutional change that they equip people to engage, and
4. the process iterations extend over time, gradually resulting in new publicly common ways of relating,

then political development will be fostered. This is a long-term strategy-agenda. A fundamental prescription in this agenda is that its methods to address issues must afford opportunities that are conducive for developing new competencies *over time* in the culture, in individuals and groups, and in their institutions. If methods support this prescription, then people might make qualitatively different contributions to their own quality of life, their interactions, their institutions, their environments, and the challenging issues that often pervade them.

Research Context and Interest

This study grows out of my overarching research interest to develop and use the *how to's*—the structured analysis and discourse methods—that might advance political development *while* and *by* addressing complex issues and questions. The methodology I used in the study was a replicable, structured process I developed almost six years ago, the design of which is grounded in years of public issues analyses and action research, understandings of adult development and dynamic systems, the roles of action inquiry and deliberation, and other foundations. Its design embeds assumptions that its methods need to invoke, utilize, encourage, motivate, develop, and use humans' capacities as they confront complexity in issues that concern them. Its central *function* is to enable people to identify and work on the systemic layers of complex issues.

Working on complex issues in such ways invites reflective thinking. This and other capacities mentioned later are both *products* and *agents* of using such methods to foster political development. As one of the capacities that play simultaneously product-and-agent roles, reflective thinking

> introduces the *capacity* to reason and make conclusions about ill-structured problems at a more complex level. [From the point of introducing this capacity, there is a traverse], with the actual development of reflecting thinking skills, and [their] eventual functional use in everyday life, dependent on application of this capacity to complex knowledge dilemmas so as to construct reflective thinking skills over time (Fischer & Pruyne, 2003, p. 176).

Reasoning about and reflecting upon such issues or problems is an important way to interact with the environment. The sciences that study dynamically complex adaptive systems, including biology, psychology, and anthropology, have shown that humans and their social systems can evolve to greater complexity as they interact with changes in their environment. Fields of genetic epistemology, other branches of cognitive science, and education have studied human cognition developing the capacity to perform more complex tasks as it interacts with the environment. Information about *how* we humans and other systems do this is crucial to know if development is to be fostered.

The Model of Hierarchical Complexity (MHC) was developed and refined over the last twenty-some years. It was recently posited as a formal theory (Commons & Pekker, Submitted), and makes a significant advance beyond just describing stages of development and what capacities develop during them. Applicable across human cultures, species, and even computer simulations, among its other contributions to the behavioral sciences and developmental research, this mathematical theory accounts for each step of transition in development in any domain. It does this by assigning to every task an order of hierarchical complexity, resulting in objective measures irrespective of the content, context, or performer of a task. The model "replaces the old, flawed empirically based ideas of developing mental structures" (p. 3). This makes an important, potential contribution to inspiring more research into how to foster human development, particularly since "the traditional notion of developmental stages has been hopelessly mired in empirical problems that have led to its abandonment by many as a coherent measure (see discussions by Brainerd, 1978 or Broughton, 1984)" (p. 3). As a comprehensive developmental theory, the MHC accounts for "a) what behaviors develop and in what order, b) with what speed, and c) how and why development takes place" (Commons & Richards, 2002, p. 2). An important implication is that we need not hazard guesses nor make leaps of logic to attribute cause when we want to study and explain why development occurs in individuals and their social groupings at any scale. This is because the sequence of hierarchical task construction is mapped out, and "there are no intermediate complexity task actions" (Commons & Pekker, Submitted, p. 4). Rather, each discrete step of each increase in performance is identifiable and measurable, both within and across domains of activity, such that "one need not posit as a cause spurts in brain development" (p. 4), for example, or other causal explanations that do not account for the dynamics of development's "how and why." The MHC is essential for grounding assumptions in this study's methodology. However, although it includes the how and why, and general issues of support, contingency settings, and other general factors, it does not, itself, include applications or methods.

Relatively little research has been done to investigate methods to foster adult development that will demonstrate capacities beyond those possible at the more common adult stage of formal operational logic. Alexander's research with prison populations and children using Transcendental Meditation (TM) techniques (Alexander, Heaton & Chandler, 1994, p. 59) and numerous other studies have documented "that TM produces distinctive physiological, psychological, and sociological effects (Orme-Johnson & Farrow, 1977; Chalmers, et al., 1989)" (p. 65). One longitudinal study of TM practitioners showed a substantive number of the student experimental subjects at Maharishi International University scoring at postformal levels (p. 62). As discussed by both Alexander et al and Torbert (1994), the TM studies reflect different assumptions about the how and why of adult development than, for instance, Commons et al, cited earlier. They center on different hypotheses about the role of effort in development: "From the perspective of Vedic Psychology (Maharishi, 1972, p. 18:8) any individual effort hinders the experience of transcending and diminishes the realization of natural and balanced personal development" (Alexander et al., 1994, p. 62). Since complex issues require effort to address them, this research has little bearing on methods used to foster political development.[2]

---

[2] The studies concentrate on sole individuals' meditation practice in the isolation of their own minds and beings. Given the evidence that organisms develop in the course of their varied interactions with their entire environment, an investigation into the culture of the university community where TM was embedded as an individual practice could produce some interesting findings. For example, how does a presumably non-adversarial "institutional atmosphere" and Vedic norms in the "cultural atmosphere"

The literature on fostering critical thinking and transformative learning in adults (e.g., Brookfield, 1987; Cranton, 1994; Freire, 2002; Mezirow, 1991; Taylor, Marienau & Fiddler, 2000) is germane to this study in its subject matter, since the process embeds opportunities for critical insights to develop and be used. There are signs that adult developmental perspectives are beginning to converge with the adult learning field (Hoare, 2006), and this may extend such efforts beyond their traditional settings. In the meantime, the methods used in educational venues do not transfer well to the public sector and voluntary citizen work on public issues.

Literature that is germane to my research would reflect the premise that human development, transformation, adaptation—different labels for the same dynamics—emerge and transpire in social settings and interactions and in response to the larger environment. From my perspective, rather than treat such development as an isolated individual endeavor, it should be regarded as a dynamical political process because it inherently involves our ways of relating to self, others, and the world. Another criterion for literature related to this research is recognition that our complex issues arise and exist as *complexes* that manifest and reflect the myriad ways that people, their institutions, and their processes are (or are not) relating with respect to them. Complex issues are more than just the "thing" that their labels suggest and that people debate (e.g., conflict, poverty, unemployment, education reform, etc.). As complexes, they are made up of many issues and they need various layers of integral attention, analysis, decision-making, action, coordination, and evaluation extended over the long term.

Thus, more germane here are intentional practices that "treat not just individual persons, but all social systems from brief conversations to intergenerational institutions as capable of developmental transformation" (Torbert & Associates, 2004, p. 218). A small body of research validates that specific practices involved in action inquiry—whether used in educational or organizational settings, or in informal groups—can foster adults' postformal development into more complex capacities (Rooke & Torbert, 2005; Torbert, 1994; Torbert & Associates, 2004). They do this by the way they direct people's attention into the tasks involved in this practice of "learning from the four territories of experience through action inquiry" in the course of daily life (Torbert, 1994, p. 199). Action inquiry's powerful effectiveness and broad transportability are among factors that led Torbert to conclude, "the only political principle that invites the potential transformation of everyone's perspective is the principle of inquiry" (Torbert, 1991, p. 236).

A look at those four territories of experience can help to make the connection with inquiry's role more evident.

- First territory. *Outside events*: results, assessments, observed behavioral consequences, environmental effects.
- Second territory. *Own sensed performance*: behavior, skills, pattern of activity, deeds, as sensed in the process of enactment.
- Third territory. *Action-logics*: strategies, schemas, ploys, game plans, typical modes of reflecting on experience.
- Fourth territory. *Intentional attention*: presencing awareness, vision, intuition, aims (Torbert & Associates, 2004, p. 22).

Torbert et al's theory and praxis of developmental action inquiry bears on processes to foster political development, regardless of issues' subject matter. However, complex issues involve

---

serve as the kind of "contingency setting" that is conducive to individual development (see Commons et al., 2005)?

substantive additional factors that require additional processes, which may or may not embed action inquiry. These refer to the criteria I mention above. Specifically, these include down-to-earth analyses of issue-layers. These engender layers of complex decision-making and priority setting, and systemic action by institutions and citizens in various configurations and contexts. Much of that structured and unstructured work is voluntary, is systemically joined with policy-making dimensions, and requires deliberation for complex decisions about both voluntary and official action.

Thus, my review of the literature turned to other sub-fields including public participation with deliberative dialogue and methods for addressing group or moral conflicts. I will confine the focus here primarily to deliberation-related issues. The literature indicates that the "how and why" of public deliberation is still little understood: "The field of public deliberation and our knowledge about this phenomenon is nascent, and much remains uncertain" (Williamson & Fung, 2004, p. 3), largely because "empirical research has lagged behind theory and practice" (Delli Carpini, Lomax Cook & Jacobs, 2004, p. 315), a gap that some have already attempted to explain (e.g., Levine, Fung & Gastil, 2005) and that I will not repeat here. Until fairly recently, when public deliberation or deliberative democracy was discussed or theorized about, the underlying assumption was that deliberation was, or would be, actually taking place among citizens convened for that purpose. Part of the problem in some deliberation research seems to be the absence of criteria for what constitutes deliberation, under what conditions it occurs, and for what purpose. Questions about deliberation are surfacing that challenge earlier assumptions and give rise to new hypotheses. Complicating the matter, clear agreement about the definition of deliberation is not evident (Delli Carpini et al., 2004), nor is there a scheme to understand its various contexts and purposes, qualitative variances, or explanations for them. These are signs of the still-new status of deliberative democracy as a subfield of political theory: it was only "around 1990 [that] the theory of democracy took a definite deliberative turn" (Dryzek, 2000, p. v).

Two recent reviews of the empirical literature on deliberative democracy's practices (Delli Carpini et al., 2004; Ryfe, 2005) provide thorough discussion of the state of the subfield, its challenges, and its questions and I refer to some of them only in summarizing this section.

Beyond the literature's discourse, numerous "civic entrepreneurs" have been pursuing their own initiatives which are "vital laboratories of public deliberation," including: Center for Deliberative Polling, Citizen Juries, National Issues Forums, AmericaSpeaks, Study Circles Resource Center, Public Conversations Project, Viewpoint Learning, and others (Williamson & Fung, 2004, p. 12). Some of that work uses multiple, more loosely-structured, quasi-public sessions over long periods (Saunders, 1999, 2006) or single sessions (Pearce & Littlejohn, 1997) to explore and improve conflicted relations or issues. Despite all the activity, little empirical work has been done to study how in-person deliberation influences later behavior and political beliefs Burkhalter et al., 2002)" (Gastil, 2004, p. 309). Findings from a combination of two different studies that used NIF as civic education to explore a social cognition model led to a conclusion was that "it would be a mistake to increase the quantity of NIF and similar programs without simultaneously devoting sustained attention to improving their quality" (Gastil, 2004, p. 327).

I have previously presented (Ross, 2002; Ross, 2005) the way I integrate developmental understandings into my theory and methodology, including the process for framing issues so that they can be deliberated. Important additions to the literature on deliberation that also have a developmental perspective have been made by Rosenberg (2002, 2004a, 2004b, 2005) and his former graduate student, Winterstein (2005). Its close relation with my research makes it important to discuss Winterstein's dissertation research. He produced a developmental stage model of discourse based on Piaget, Kohlberg, and Rosenberg's (1988, 2002) previous work, and participated with Rosenberg in two small studies. One involved college classes, one involved residents in a community. Doing his reporting before all transcriptions and data analyses were complete, he tendered the conclusion that people must be operating at the systematic stage in order to deliberate, and that his study participants' capacities and their discourses were not nearly systematic: therefore, they could not and did not deliberate in the studies. Rosenberg's recent work has not yet included final reports on the two studies introduced by Winterstein, but he has been asserting that citizens cannot deliberate and challenging assumptions about deliberation's possibilities. The main contribution of these authors' work, in my view, is their developmental perspective entering the discourse on deliberation.

My research interest and methodology include but are not confined to public deliberation, but I do not find literature that extends beyond deliberation to address the scope of my research. Therefore, I mention below some purposes cited for public deliberation to create a broader context for it here.

Buttom & Manson (1999) derived from their studies that the prevailing orienting purposes of convening deliberative gatherings reflect a range: educative, consensual, activist/instrumental, and conflictual. Levine et al. report that despite the countless deliberative efforts over many years, the idea of action as a purpose is a new idea now occurring to some convenors. Actions come out of decisions to act, and although many writers do not discuss citizen action at all, some do regard the general purpose of deliberation to include decision-making or common ground that can inform policy decisions, e.g., Macoubrie (2004), Mathews (1999), Lee (2003), Rosenberg (2005), and Winterstein (2005). Others have taken the thinking further into specific needs, advocating for deliberative decision-making to characterize how we coordinate our intentions and actions to guide our future actions (den Hartogh, 2004), to address future stakes (Karlsson, 2005), grapple with issues concerning science and technology in relation to governance (Farrell, 2003) and concerning the global environment (Dryzek, 2000; Laslett, 2003; Stern, 2005). Some view the benefits so vital as to advocate for the institutionalization of deliberative techniques and norms at the level of national government (Levine et al., 2005; Williamson & Fung, 2004) and international agency and development efforts (Daubon, 2005; King, 2003). One motive for this advocacy is to exploit such techniques' potential for reconstructing boundaries and transcending differences that manifest in violence between and among communities, a necessity for "any ethical enterprise aimed at constructing moral and political community" (Lee, 2003, p. 22). All of these purposes are relevant to my research and to the research agenda for public deliberation.

I classify the chief elements of that research agenda as process-structure issues and the informed application of developmental understandings. Those who have recognized the need for structured processes, although they do not provide methods, include Dryzek (2000), Gastil (2004), Levine et al. (2005), Macoubrie (2004), Rosenberg (2005), Ryfe, (2002), and Winterstein (2005). Habermas summarizes the elemental importance of structured processes or procedures when he writes, "'Dialogical' and 'instrumental' politics can *interpenetrate* in the medium of deliberation if the corresponding forms of communication are sufficiently institutionalized. Everything depends on the conditions of communication and the procedures that lend the institutionalized opinion- and will-formation their legitimating force" (Habermas, 1998, pp. 245, emphasis in the original).

In order for future research to identify “particular keys, strategies, or patterns of talk” that assist “successful deliberation” (Ryfe, 2005, p. 60), informed application of developmental understandings need to underlie both assumptions about deliberation and the design of discourse structures for it (Rosenberg, 2005; Winterstein, 2005). A new ingredient in the discourse is the argument recently introduced by Rosenberg and Winterstein, described above. That stance counters others’ assumptions and assessments, including my own, and also Ryfe’s (2002, p. 5) conclusion that “it is not then, that people cannot deliberate, it is simply that they often don’t in these forums.” Public deliberation is unlikely to occur outside of well-designed structures.

Ryfe (2005) suggests that findings indicate the need to revise images assumed by deliberative theorists. Those efforts need to include a great deal of boundary crossing in two areas summarized by Ryfe (2005): (a) “Despite its breadth, the empirical study of deliberation is not yet very rich or deep. More integration across disciplinary boundaries would be useful” (p. 64); (b) “Moreover, the theory of deliberative democracy needlessly remains removed from its practice” (p. 64) and practitioners of deliberation, empirical scholars, and theorists “might gain from greater interaction” (p. 49). That would facilitate the new learning needed to fill the glaring void apparent in the discourse, because “finally, and perhaps most importantly, we must learn more about what deliberation actually looks like. It simply will not do to place the very practice under investigation into a black box” (p. 64).

Thus, I have located a void, wherein no work or research has been conceived, designed, or conducted that reflects this paradigm for fostering political development. This present study makes an original contribution to social knowledge that begins the long process of responding to and filling that void.

My research interest in this study was to answer these questions.

1. What changes, if any, would participants experience that could be associated with their participation in the process? If any changes were experienced, did they involve discernible changes in any of their action-logics[3]?
2. What could be learned about the public issue that participants would select and develop during the process?
3. What would happen during the process, if anything, in the political culture of the small group?

Theoretical Perspectives Underlying the Methodology

I include this section as a foundational reference for understanding the study as a whole and my interpretations of its findings. Included below are the major theoretical perspectives that are embedded in the methodology. As a whole, this section is an overview of key, interrelated premises in some other fields that underlie both the research methodology and my analyses. It includes a subsection to introduce why participants’ *tone and intention* issue was important from this vantage point on theory and praxis. I believe the inclusion of these foundational ideas, here, helps my discussions to be more efficient later in the report.

---

[3] The term *action-logics* is defined in the next section.

Integrating Diverse Concepts and Practices as Dynamics of Political Development

In this section, I integrate important concepts within theories of motivation, transformative learning, nonlinear dynamics, action inquiry, and adult development. By integrating the dynamics that those concepts represent, I can then relate them to the study's methods and practices for issue analysis, action inquiry, deliberation, and decision making. The objective is to convey a holistic understanding of the dynamics of adult development as they pertain to my methodology, and to political development in general. This should elucidate key aspects of my paradigm of fostering political development using structured approaches for working on complex issues by showing the integration of the dynamic development of the adult and the political in a hopefully seamless fashion. To arrive at a seamless whole requires that I first identify the "parts" and dynamics comprising it. Therefore, this discussion involves a great deal of detail to accomplish its purposes. I believe the effort supports my goal to make the study's reporting more efficient and to make at least parts of the overall report meaningful to diverse audiences.

Despite the concept's obscurity, conation and its dynamic role in human development (Maslow, 1987) and transformation (Mezirow, 1991) are important considerations for understanding choices of behavior. In addition to being an important dynamic to integrate here, I also draw upon it later in the report in connection with study participants' levels of hope and motivation. Both Maslow and Mezirow describe conation as an intensity of desire companioned by the free choice to act on it. Conation heightens in the process of learning experiences that have transformative qualities. For example, a new insight that significantly re-frames a former assumption about how things work in some area of life-interest is typically followed by the strong desire to put the insight to active use. Thus, transformative learning involves intentions toward new activity, and "behavioral intentions involve conative, cognitive, and affective [i.e., emotional] dimensions" (Mezirow, 1991, p. 14). In that light, the participants' tone and intention issue—where tone is understood as *imbuing* behaviors—was about behavioral intentions, and it involved those dimensions of conation, cognition, and emotion. A key tenet of transformation theory is that as people gain insights into new perspectives, they are motivated to act out of them with a new sense of empowerment (Mezirow, 1991). To complete that picture, it is important to incorporate environmental factors into considerations of these "behavioral intentions." This is because (a) human behaviors *are* interactions with the larger environment, and (b) intentions are formed in the context of that larger environment. The findings from this study make it important to situate transformative learning events in the larger frame of the politics of adults developing their interactions within, and with, their environment.

A Synthetic Logic

To provide the rationale for the analytic categories I use later in this report, and so that I can discuss the findings as a coherent whole, I begin with a synthesis of Mezirow's three dimensions of transformative learning's intentions. Then I use that synthesis as a starting point to map a logical progression that explicates the important concept of *action-logic* and the generic conditions for developing insights and new action-logics.

According to Mezirow, behavioral intentions involve insights into new perspectives (cognition), motivation to act (conation), and a new sense of empowerment (affect, or emotion). Motivation theory demonstrates how these dimensions are inseparably intertwined, and establishes conative energy as an inherent human quality, not confined to specific learning events:

> In a certain sense almost any organismic state of affairs whatsoever is in itself also a motivating state. [Others seem to assume] that a motivational state is a special, peculiar state, sharply marked off from the other happenings in the organism. Sound motivational theory should, on the contrary, assume that motivation is constant, never ending, fluctuating, and complex, and that it is an almost universal characteristic of practically every organismic state of affairs" (Maslow, 1987, pp. 6-7).

That theory pivots on humans' and other organisms' natural drive to satisfy needs, putting the *process* of gratifying needs center stage. The different stages of human development demonstrate different needs to strive to meet (Maslow, 1987). New needs arise as a new stage if the basic needs of the previous stage have been met. Organisms are motivated to strive to meet their basic needs, which are ends unto themselves *because* they are basic needs. Because these "ends are intrinsically, and in themselves, valuable to the organism, it will therefore do anything necessary to achieve these goals" (p. 35). The striving, the motivation to strive, the gratification of basic needs, and any frustration or depression at not satisfying basic needs, are *affective* (p. 42). Therefore, conation is an emotional dimension. On that basis, Mezirow's formula above can be slimmed to two dimensions: behavioral intentions involve (cognition) + (conation/emotion).

Maslow's explication of the cognitive dimension and its *needs* is valuable for understanding development and transformation, for integrating understandings of their dynamics, and for interpreting what happened in this study. He refutes prevalent connotations of the cognitive as being the arena of dry intellect, and illuminates how humans have basic cognitive needs. Those needs are vital because cognitive capacities are vital to meet other basic needs: "it is clear that any danger to [cognitive capacities], and deprivation or blocking of their free use, must also be indirectly threatening to the basic needs themselves" (p. 23). The basic cognitive needs are the "desires to know and to understand." Further, "the gratification of the cognitive impulses is subjectively satisfying and yields end-experience….Insight is usually a bright, happy, emotional spot in any person's life… the desire to know and to understand are themselves conative" (pp. 23-25). On this basis, Mezirow's formula slims even further: behavioral intentions involve (cognition/conation/emotion).

This unity supports the framework I use below to integrate notions of transformative learning events with *development.* Further, it supports a whole-person model of development by not carving up human experience into compartments such as moral, cognitive, emotional, value systems, etc. (or even drawing thick lines between the personal and the political). Others have already framed dynamics of human development in holistic, non-compartmentalized terms. These include, for example, theories of action inquiry (Fisher, Rooke & Torbert, 2000; Torbert & Associates, 2004), the biological basis of cognition (Maturana & Varela, 1998), cybernetics (Bateson, 2000), emergent cyclical (Graves, 2005), hierarchical complexity (Commons & Pekker, Submitted; Commons & Richards, 2002), motivation and personality (Maslow, 1987), nonlinear dynamics of cognition (Thelen & Smith, 1994), process psychology (Roy, 2000), and subject-object differentiation (Kegan, 1982). Of those, Fisher et al, Commons et al, Graves, and Kegan identify discrete stages of development. Of those stage theories, two of them—action inquiry and hierarchical complexity—are explicit about the fractal levels at which, and the different domains in which, different stages of performance actually operate concurrently in a person's life.

Since I interpret some of the findings in terms of domains of life, I need to indicate why, and that, transformative, developmental events and their dynamics show up both at small and larger scales, and in single domains and across multiple domains. My coverage is directed to the limited needs of this report; others in addition to Commons et al. and Torbert et al. have documented this (e.g., Burleson & Caplan, 1998; Dawson, Xie & Wildon, 2003). In developmental theory, the term *domains* refers to context-categories we may create to distinguish different environments where activity takes place, such as home, work, community, or governing. For more specificity, relevant sub domains within them can be identified.[4] My discussion will draw from both action inquiry and hierarchical complexity and embed nonlinear dynamics. For the logic presented below, I employ Torbert's conception of action-logics. Action-logics are distinguished by their hierarchical complexity of tasks, as described in the MHC that I discussed earlier.

The following logic provides a context or framework for my later discussions. It begins with the now-unified rendition of Mezirow's transformative learning dimensions: the behavioral intentions involve (cognition/conation/emotion). Those dimensions unite in a natural synthesis, where:

1. (conation/cognition/emotion) → why people act as they do (i.e., behavioral intentions)
2. People *form* and *use* logics of action
3. These are the *dynamics of undertaking* human action. → decisions about acting/reacting
4. This is about the *process* of human activity. → comprised of continuous decision dynamics
5. Human activity is made up of events that happen.
6. People often experience events as being "chunks" of discrete, identifiable happenings yet events (at many scales) seamlessly constitute all human experience.[5] Thus, events and experience are inseparable, like two sides of the same coin of human existence. (Sometimes events are treated as external happenings; if so, that overlooks the multitude of happenings going on within individuals. Both kinds of events co-constitute human experience. The contradiction dissolves if event/experience is viewed as a seamless whole, which is the viewpoint here.)
7. Every event/experience (however brief) co-forms/in-forms people's decisions (aware-ly made, or not) about *how* to inter-act with it.

---

[4] Bateson's (2000) concept of *cybernetic system* is superior to *sub domain* when discussing how action-logics develop to greater complexity. While it is beyond my scope to delve into, for present purposes, activities in sub domains can be *loosely* related to cybernetic systems. Bateson's complex system of thought, which he called a "cybernetic epistemology" (p. 467), understood cybernetic systems as the "units of evolution" (p. 466). This bears on why I believe it is important to report some of the study's findings in terms of domains and sub domains.

[5] This view is consistent with Whitehead's (1960) cosmological view of reality as process.

8. *How* people inter-act with their event/experience reflects the above dynamics of *forming* and *using* a logic of action, i.e., an action-logic.

9. *Forming* and *using* an action-logic involves a decision-making process (aware, or not).

10. People decide to inter-act a certain way *only if* it is logical *to them* to do so.

11. If people assume (implicitly or explicitly) that they do not have a free choice to inter-act—for whatever reason(s)—then they will *perceive* that certain decisions are not possible. 'Impossible decisions' are illogical, by definition, and people do not choose or make them.

12. A decision/choice of inter-action will be logical *only if* it makes sense in a given event/experience.

13. What makes sense depends on how people (a) *perceive the environment* of the event/experience they may inter-act with (e.g., threatening, supportive, creative) and (b) *perceive the benefits* of a potential inter-action.

14. If they perceive a "match" between the environment and potential benefits, people will naturally desire—be motivated—to inter-act with the event/experience.

15. If people do not perceive a match, they are unlikely to be motivated (and may inter-act, in effect, by deciding to *not* inter-act directly with the event/experience.)

16. The *way* that people perceive the environment and potential benefits is shaped by whatever action-logic they *form* and *use* toward an event/experience + its environment + its benefits.

17. Action-logics rest on assumptions about possible options for inter-acting and achieving desired ends.

18. If people do not (or cannot) assume/perceive certain options, then the options do not exist, *for them*. (Then their action-logics reflect repetitive patterns in decision-making about how to inter-act with event/experiences, based on existing assumptions/perceptions.)

19. People encounter possibilities for new options in the form of *insights* that arise during or after their inter-actions with one or more event/experiences.

20. When people actively inquire into new insights, their new perception of now-new options may lead them to *form* and *use* new action-logics because a new, *now-logical* possibility has appeared in sight.

The Dynamic Process of Developing Action-Logics

Consistent with transformation and some adult learning theory, this logic indicates that *insights* are like seeds from which transformative change *may* develop. Such change includes new assumptions and transformed perspectives (Brookfield, 1987; Cranton, 1994; Freire, 2002; Mezirow, 1991; Taylor et al., 2000; Torbert, 1994). When we have an insight, we may "see our way into" new perspectives, which are ways of viewing things. Perspectives are not, however, disassociated from action-logics: rather, the two are as inseparably intertwined as conation/cognition/emotion. According to the Model of Hierarchical Complexity, a person's

> perceptions of the world (and the stimuli in it) are influenced by frameworks. These frameworks embody the individuals' conditioning history, including cultural, educational, religious, political, and social backgrounds, among other factors. These combined frameworks are referred to as one's perspective. Perspectives differ in terms of hierarchical complexity. As the hierarchical complexity of an individual's response to task demands increases (i.e., as complexity of performances goes up), the individual is increasingly likely to have taken many such perspectives into account (Commons,& Rodriguez, 1990) (Commons, LoCicero, Ross & Miller, 2005, p. 1).

Perspective transformation is not a lateral or translative shift in how people operate. Rather, it is an integral dimension of developing qualitatively different *action-logics* (Torbert & Associates, 2004). An action-logic reflects the framework a person has about how things seem to work in a given situation or in general. Thus, action-logics can show up at the scale of an event/experience as well as the scale of a more pervasive world-view (Fisher et al., 2000). All development follows a progressive logic of actions, which are made up of tasks of increasing hierarchical complexity (Commons & Pekker, Submitted). When we have an insight in a particular domain of effort, it may help us internalize a more complex-than-before set of connections about how things work in that domain. Although only some action logics use *reflective* thinking, the basic dynamic in the organism is akin to this: "reflective thinkers do not take knowledge as given, but instead they evaluate it and then combine it in novel and complex ways to construct and evaluate new ways of understanding and knowing" (Fischer & Pruyne, 2003, p. 178). If the more complex connections get made, one action-logic gives way to the next hierarchically complex action-logic. Through the lens of that next action-logic, perspectives can "see more." If the new insight is used, transformative learning has taken place, at least in the domain in which it arose. At different stages of development, people have correspondingly different capacities, affecting if or how they may reflect on and transfer learning from one domain to others (Fischer & Pruyne, 2003). Thus, if or when transformative learning takes place, it may remain confined to only its original domain, or may extend across to others.

The concept of transformative learning needs to be situated in the context of development's hierarchical complexity, because what can be considered as transformative can be qualitatively different: it depends on how complex a person's action-logic is in that domain. For example, a child will have a zero-loop action logic of helpless, repetitive whining, such as: "I want my teddy bear." The child may pitch the whining at higher and lower volumes in revised efforts to get a response (*quantitative* change, not qualitative). The whining may get no response from the environment (the teddy bear does not magically appear in the child's arms, a caretaker does not deliver it from another room in the house, etc.). *If* the child is motivated enough, the desire for the teddy bear, possibly combined with the visual memory of someone bringing it previously, may connect as an insight, inspiring and further motivating the child, who begins to actively look for the teddy bear. This adaptation in response to no-outcomes-from-whining would be transformative learning for that child in that sub domain: the zero-loop behavior of whining transformed into a new, single loop action-logic: “My teddy bear (still) is not here; I look for my teddy bear.” By contrast, this behavior change would not represent transformative learning if a lazy older person whined for someone to deliver a meal over to the easy chair, but finally got up and got the meal independently. The older person already had the capacity to exercise single-loop behavior change in that sub domain of being hungry while sitting in the easy chair.

Several of these concepts are combined in Table 1. Column 1 illustrates the concept of domain by an analogy of using a radio station and media in increasingly complex ways. Column 2 indicates the number of feedback loops (sometimes called learning loops) each action-logic uses, and introduces the action-logic titles I use in this report. Column 3 indicates differences in adult action-logics in terms of the contents included in feedback loops. It shows the quantitative increases in the type of activity that each loop includes. These loops can be thought of as a lasso, with each larger lasso encompassing more than the previously-sized lasso could. As column 3’s heading suggests, these loops encompass (quantitative increase) progressively more territories of event/experiences (qualitative differences) as its sub-columns are read from left to right.

Finally, Table 1 (click here) portrays how development that is typically thought of as stages that a person may develop through over a lifetime, it is a pattern of action-logics that transpires throughout lifetimes at larger and smaller scales. The pattern behaves like “mini-stages of development” in all event/experiences, as I intend for the whining child and the radio analogy to illustrate. This indicates that these self-similar (*fractal*) patterns are processes—like building blocks—of all development into increasing complexity. This is one important implication of the Model of Hierarchical Complexity. Row 5/0 across the bottom of the table is my attempt to indicate this, although within the confines of one table, it is difficult to illustrate one pattern that appears at all scales. As incremental capacities get added, from left to right in that row, the feedback loops’ activities operate as the *transition steps* required to develop the next higher action logic at any scale (see Commons & Richards, 2002 and Commons & Pekker, Submitted). *Scale* is almost infinite; it can refer to a set of thoughts, an event/experience, a skill, a domain, a life-world (worldview, paradigm), a society, an era, etc. Every time we reach a new synthesis (sub-column 5/0) regardless of scale or activity, we have developed a new paradigm for operating “there”—we completed the *quantitatively required* transitions (Commons & Pekker, Submitted) to operate at a more complex action-logic (or stage of performance). Then, as we use that new action-logic, our activity that uses it gets classified in sub-column 0. This simply means that the end of one full set of integrated learning transitions, once they are consolidated, places us in potential readiness to begin a new learning cycle from within our new, more complex action-logic.

The foregoing points were that people develop new action-logics in the course of active life, that action-logics pertain to all domains and scales of human activity, and that there are different action-logics that reflect varying degrees of complexity. Below, I describe four “full stage” adult action-logics that are relevant to this study’s findings. It does not give illustrations of the transition steps between the full stages because to do so would unduly extend this section. These action-logics are *structures* of behaviors and reasoning, which is a different way to think about human behavior. Therefore, under each description, I include one example of study participants’ *content* that uses each different structure, to show the differences in the action-logics’ hierarchical complexity between each stage. The examples come from asking participants what they thought of or meant when they heard or used the term "community." Each meaning would underlie (be the *logic* of*)* how they *acted* with regard to community. I use both Torbert et al.'s and MHC's (the Model of Hierarchical Complexity) names and descriptions for these stages because they are complementary and familiar to different audiences. See Torbert & Associates (2004) and Commons et al. (2005) for fuller descriptions. A critical reminder is that people employ different action-logics situationally, depending on the event/experiences they find themselves in and the level of hierarchical complexity they have already developed (or are ready to develop).

Abstract/Diplomat. Uses stereotypes and clichés; uses quantifiers when describing things (all, most, none, some); talks about variables of time, place, act, actor, state, type; makes categorical assertions ("we all know that"); seeks group membership, status, is loyal to in-group; saving face is important.

> Example: "People. You think of people involved and people activity and places where the community can go to feel safe and spend time together. Most communities do not have that anymore."

Formal/Expert and Achiever. Argues using empirical or logical evidence; logic is linear (if…then, because, thus, therefore); seeks causes and solves problems based on one input (causal) variable; dogmatic; accepts feedback only from objectively acknowledged masters; uses longer-term thinking to achieve results.

> Example: "This community is, basically the [name of local city] area because we have the boundary lines of [names three counties] that meet the city boundary; therefore, that area would be this community." [empirical boundaries as input variable, logic based on their relations]

Systematic/Individualist. Coordinates multiple variables or factors and uses them as input to recognize systems of relationships; forms matrices to illustrate relations; situates events and ideas in larger contexts (present and historical); relativism may show up while juggling these multiple relations; is less inclined to judge; systems are formed out of relations; starts to recognize self as system and notice own shadow.

> Example: "I don't know how to mention this but the word community has a lot of meaning because we are looking to developing a residential community here at [work site] so we have been going around to meetings trying to put community, create community, to develop a housing community here at [site of employment]. The word 'community' has a specific meaning in that context, in terms of an intentional, planned place to live, work, and have relationships with people." [system]

Metasystematic/Strategist. Integrates systems, constructing metasystems, which can take the form of higher principles that coordinate systems coherently; principles go beyond rules, customs, and exceptions; reflects on and compares systems and perspectives coherently (meta-analytic), and is aware that people's perspectives depend upon their action-logics; recognizes perspectives as systems, and multiple perspectives as metasystems; coordinates short-term goals with long-term process orientations.

> Example 1: "I just think of community as a group of homes or people living in homes that are in *x* amount of numbers where they go to the same school, that you see one another, and you are a part of paying either city taxes or county taxes [system] and those taxes go to whatever things that you participate in publicly in that area [system]. That is how I see a community" [metasystem that coordinates relations of systems].
>
> Example 2: "I guess, you know, I think about this community more in terms of what we talked about, the [site] community per se, and all of the different constituencies that were included in there. I guess I kind of felt a part of that community, if you will. I think that could be translated a lot of different ways, in terms of community. I think it maybe changed my perception, that it includes a lot of different parties coming from different perspectives [who] a lot of times you don't really perhaps think about that have an interest in an issue or a topic, or whatever." [metasystem of parties with different perspectives and interests]

This section has been a long, dense traverse to arrive at its simply stated conclusion about where these theoretical perspectives lead. Human interactions with the environment are continuous event/experiences that happen all the time at numerous scales. Decisions about how to inter-act derive from whichever action-logics a person has available and other factors that influence motivations. The more territories of experience that a person can inter-act with, the more complex that interactive action-logic is and can become. My theory for fostering political development uses that foundation as a basis to build into methodologies all the territories of experience that are practical within given tasks that are needed to address issues. Thus, event/experiences that introduce and use more territories of experience are part of my overall methodology.

To give some indication of this integration, Table 2 lists main practices of the method's issue-work with their action inquiry elements. This is shown within the same columnar format as Table 1, with the incrementally more complex action-logics from left to right. While it is not easy to indicate process dynamics in a static table, or how they are woven through the method in various iterations, Table 2 indicates that the pattern built into the methodology is a fractal that is self-similar to Table 1's developmental pattern. It indicates the progressive looping of more elements to (hopefully) arrive at a major synthesis, a new decision point. The decision point/synthesis in Table 2 corresponds to Table 1's last cell at row 5/0 in column 5/0. There are several smaller decision points within the process, indicated by an asterisk. Each one represents that the group has created and must inter-act with an event/experience before work can continue.

Table 2. Integration of Method's Main Practices With Action-Logics and Action Inquiry.

Main Practices Within Methodology In Relation to Developmental Sequence in Table 1					
0	**1**	**2**	**3**	**4**	**5/0**
Map topics of concern; select one *	Convert topic to an issue * and gain insights R, I	Develop * systemic analysis of the issue, and gain insights R, A, I, AI	Describe multiple action-logic approaches to address issue, and gain insights R, A, I, AI	Deliberate * tensions within and across the multiple action-logics, and gain insights (R), A, I, AI	Deliberative decision-making outcome(s) R
		Create an issue action-system, and gain insights R, A, I			
		Select one systemic action to work on 1st *			
^ Issue Analyses ^			*^ Frame ^ the options*	*^ Perceive ^ landscape of options*	*^ Synthesize*
Action Inquiry's four practices weave through most tasks in this group discourse method. The four codes used above are: R-Re-framing; A-Advocating; I-Illustrating; AI-Actively Inquiring					

The Importance of Inquiring Into and Deliberating About Tone and Intention

The purpose of this section is to discuss why the tone and intention issue was critical for this group to inquire into. As Table 4 in a later section will indicate, one of the participants raised some fundamental inquiries in a mid-point discussion. In one instance, for example, "Why do we think they don't do what we want them to do?" In another, "So why do we distrust them?" The inquiries were why do *we* do something, not, why do *they* do something. Other participants did not engage the queries into why do *we,* which would mean examining some assumptions and beliefs. Nor did I, in my role as facilitator, invite them to; my activity during their impromptu diversion from task was to observe what was happening among them. I observed that they did not naturally move into an inquiry into *why do we* (or *why do I)* even in the face of the direct questions. Instead, they moved away from inquiry.

The practice of inquiry bears directly on why the tone and intention issue was important to deliberate. The method's overall design embeds the role of inquiry into an integral array of factors that make up the layers of issues. In a social context, an issue represents a collective perception of a complex, a complicated set of "stuff" going on that people want to change. Factors that contribute to perceptions of an issue include people's intentions, assumptions, beliefs, values, biases, concerns, needs, hopes, and life experiences, as well as larger social factors. The collection of those individual factors (intentions, assumptions, beliefs, values, etc.) contributes to an individual's *perspective* on an issue.

The Politics of Tone and Intention

Every attempt to address issues is political, because it intends to impact the ways of relating in and among the *polis*: the people who contribute to an issue, those who are affected by the issue, and those who have governance roles in any dimension of the issue. For people to realistically conceive of undertaking complex action to address issues, and for the actions to have the necessary integral change-making potential (where integral is understood as *essential to completeness*), an effective political change process must rest on and reflect a certain set of principles. These are implicit in the methodology, and this section is for making some of them explicit.

Torbert's (1991) explication of his action inquiry paradigm gives a coherent rendering of the principles most important to emphasize here. Habermas' (1979) communicative action theory and Freire's (2002) pedagogy for critical consciousness are consistent with these. Torbert shows a concise, building-block logic of why inquiry is an essential political activity. Three of the principles are the traditional ones of liberty, equality, and fraternity. He adds two more: inquiry and quality, as the first and last principles in the hierarchy. He recombines all of these to construct his new paradigm. He asserts, "we are missing a fourth political principle—a principle never before recognized as political—the principle of inquiry. The only political principle that *invites the potential transformation of everyone's perspective is the principle of inquiry*" (Torbert, 1991, pp. 236, emphasis added). This principle is *primary*, followed by peerdom, which combines the principles of fraternity and equality "without the sexist connotation of fraternity" (p. 234), and liberty. Quality is the "quaternary political principle, approached only in the context of the commitment, attention, and skill cultivated through ongoing practice of the first three principles" (p. 234).

In any setting, liberty and peerdom (equality and fraternity, combined) are *not necessarily* givens: perceptions and realities of whether or not they operate depend largely on the culture's operative—not espoused—action-logics. Without liberty and peerdom, people find it difficult to meet their needs, and motivation (conation) to decide to do something that seems impossible to do is naturally depressed. Maslow explicates what is at stake.

> There are certain conditions that are immediate prerequisites for the basic need satisfactions. Such conditions as freedom to speak, freedom to do what one wishes so long as no harm is done to others, freedom to express oneself, freedom to investigate and seek for information, freedom to defend oneself, justice, fairness, honesty, and orderliness in the group are examples of such preconditions for basic need satisfactions. These conditions are not ends in themselves but they are *almost* so since they are so closely related to the basic needs, which are apparently the only ends in themselves. Danger to these freedoms is reacted to with emergency response as if there were direct danger to the basic needs themselves….Secrecy, censorship, dishonesty, and blocking of communication threaten *all* the basic needs" (Maslow, 1987, pp. 22-23, emphasis in the original).

Toward completing this discussion about the importance of the tone and intention issue, I emphasize my earlier point, that every attempt to address issues is political because it *intends* to impact ways of relating in and among the polis. Thus, intention plays an inherent role in all political activity. Our intentions may be unconscious or implicit, or conscious or explicit. Interpreted in terms of Kegan's (1982) work, if we are not conscious of having certain intentions because we are embedded in them, they often *have us* and they govern our tones, assumptions, behaviors, etc. Conversely, if we are conscious of our intentions, we can *have* them without our actions necessarily being governed by them; this is because we can inquire into and modify them. If we are aware of our intentions, they are explicit in our private thinking. Often, they *seem* to remain in that private domain. However, when they flavor our speech and behaviors, they are no longer private, even though we may assume that they remain private if they are not spoken. The point, illustrated in this study, is that tone and intention's flavor enters the discourse whether intended or not. However, this can be brought into the public domain purposefully, and consciously be made explicit there, simply by speaking about them to others.

To articulate actual intentions publicly is an intensely political act. If such acts do not already characterize the publicly common ways of relating—the political culture—the acts *change* the politics (the ways of relating) *by* being acts done in public. Thus, both knowing and stating our intentions toward social change play a political role in fostering change. The kinds of intentions we have will flavor the kind of change we foster. If we have a commitment to foster positive change, we are wise to inquire into and examine our intentions so our tones, assumptions, and actions are consistent toward that goal. This is one reason why inquiry is the primary political principle and practice.

By exposing the participants to their tone and intention issue, illustrating how it showed up, and explaining why it was crucial to address, we together opened the space for them to own the value of inquiring into it in a structured, deliberative way. As Table 2's columns 3 and 4 indicate, issues are framed into diverse approaches driven by different action-logics (perspectives) on the issue. It is just as legitimate to deliberate about tone and intention as it is to deliberate about any traditional "out there" public issue. The logic that I give here shows that tone and intention are inherently political and are among the factors that make up issues. Thus, tone and intention is a public ("out there") issue, it is complex because multiple action-logics construct it and multiple approaches to address it are possible, the approaches embed competing tensions, and "this tension must be worked off by the participants' own efforts" (Habermas, 1996, p. 17). This is the classic formula for when deliberation is called for.

Paradigm of Deliberative Action Inquiry

The idea and practice of developing several approaches to a public issue so that people can deliberate about it are not new, at least in the U.S.[6] As a process of thoughtfully weighing differences, deliberation is associated with a transformative quality (Mathews, 1999) and playing a role in the sometimes decades-long process from citizen's earliest awareness of issues to arriving at a "public judgment" about them with a will to make policy changes on them (Yankelovich, 1991, p. 64). Thousands of single-session meetings for public deliberation have been convened over the last two decades. Even so, as I mentioned earlier, a change in orientation from talk to action is only beginning in the minds of many practitioners who convene them (Levine, Fung, & Gastil, 2005). In my years of doing contracted research for Kettering Foundation—in community politics action research and performing a longitudinal study—I found few signs of what my program area called "real" deliberation, and no evidence of systemic action on issues. These are natural outcomes in the absence of (a) a rigorously systematic theory and practice for issue-framing that embeds real tensions to deliberate at all, and (b) a metasystematic understanding of the layers of complexity involved in issues with processes for systemic action to be conceived. Real deliberation requires focus on the bona fide tensions resulting from different life experiences of people employing different action-logics. With a rigorous issue-framing system to help ensure such focus, real deliberation's talk does not include blaming, polemics, diagnoses, opining, and off-topic tangents that are otherwise quite common in unstructured talk—an incoherence akin to a spontaneous discussion participants in this study had (shown in Table 4 in a section below). When the deliberation is focused, people's naturally deliberative, nonlinear oscillations among and between the embedded tensions (Ross 2005) have the environment they need to elicit insights, inform and shift assumptions, and take in more of the territories of experience the issue involves. When the process is designed for the possibility, the deliberative product can lead to a metasystem of action-systems that a well-focused issue needs. The methodology used in this study reflects these improvements to deliberative practice.

---

[6] National Issues Forums is celebrating its 25th anniversary in 2006 (See www.nifi.org).

When a deliberative framework enables people to weigh several choices of action-logic-driven perspectives that they could adopt toward their own tone and intention, it is an opportunity for individual and collective processes of reflection.[7] Such occasions offer a structured event/experience to step back, perceive, reflect on, and weigh—in an orderly way—several approaches or scenarios. Each of those include different assumptions and different territories of experience. Those territories include our individual and collective intentions, strategies, behaviors, and desired impacts. Table 3 (on the next page) indicates the complex array of nonlinear dynamics that go on within a group that is really deliberating a framework based on developmental action-logics.

Inquiring into our assumptions and suspending them long enough to explore alternative assumptions and their implications are fundamental activities in accounts of critical reflection and transformative learning (e.g., Brookfield, 1987; Cranton, 1994; Fischer & Pruyne, 2003; Mezirow, 1991; Taylor et al., 2000; Torbert & Associates, 2004). Critical reflection liberates the individual and the community by making themselves observable or transparent to themselves (Badillo, 1991), and such transformative potentials are commonly associated with positive social evolution (e.g., Earley, 1997; Habermas, 1979; Morrow & Torres, 2002; Torbert, 2000). When individuals or groups can turn their reflections back onto themselves, they form a relationship between themselves and their reflections. This is called being *reflexive.* In Earley's discussion of reflexion's role in personal and societal evolution, he calls it "the most advanced form of self-reflexive consciousness" (1997, p. 323). In sum, critical reflection's "significance cannot be sufficiently accentuated" (Badillo, 1991, p. 32).

This structured approach to critical reflection using a paradigm of deliberative action inquiry with the multi-perspectives of a range of action-logics to deliberate about, enables people with different reflective capacities to conduct a meaningful issue-inquiry together. When the issue has an array of tones and intentions to deliberate, as the study participants did, people can weigh how each option may contribute to (or detract from) an overall goal, and conscious choices about them in advance can reduce the odds of self-sabotaging efforts once the active work begins. This is especially essential when the stated goal is to transform an adversarial political culture. Political development requires the landscapes afforded by "event structures" that embed the principles of inquiry and quality and the "multi-paradigmatic nature of human consciousness/reality" (Torbert, 2000, p. 75). Fischer and Pruyne (2003) summarize these last notions when they write "reflective thinking…depends on environments that support high-level abstract thinking about multiple perspectives" (p. 185), and the key factor … does not seem to be education in general, but a certain *kind* of education—a focus on reasoning about ill-structured problems" (p. 189). Participants' disparate tones and intentions toward achieving a common goal certainly represented an ill-structured problem in this study.

---

[7] The same things are true for any other issue, although *tone and intention* issues *explicitly require* three-loop learning, which always incorporates intentions in its deliberations across the four territories.

The Study

Research Perspective

The study was based on qualitative research methods, using individual interviews, participant observation integrated with action research, and my reflections as the researcher and process facilitator. The study was informed by the theoretical perspectives described earlier, which are embedded in the methodology.

Participants and Data Collection

The population of interest was any adult who lived, worked, or felt invested in the selected U.S. community. The site selected was a small city and the areas adjacent to it, referred to below as “the community.” All eight participants lived and/or worked in the community. They engaged in the informed consent process for research with human subjects and signed the appropriate forms indicating their informed consent to participate. They ranged in age from 31 to 57 years, with educations ranging from two persons with general education diplomas and some post-secondary education, to three with Master’s degrees.

Fieldwork spanned approximately three and a half months and included individual pre-process interviews, six consecutive weekly group sessions, and individual post-process interviews, all audio-recorded. Process methods used during the group meetings varied by session, with the following sequence of general tasks.

1. Identify all the topics of concern in the community and why they are concerns. Map how and why they connect with each other.
2. Select a priority topic to focus on. Using the steps provided, select one of the issues derived from that topic, and analyze why it exists, its impacts, and the factors that support its continuance.
3. Identify a systemic array of reactive and proactive actions tailored to address the issue.
4. Using criteria provided, select one of the actions that will require complex decision-making about its implementation.
5. Using the template provided, develop several viable, diverse approaches toward deciding upon that action; product a brief issue booklet about the question that needs deciding.
6. With the aid of the issue booklet, deliberate all the pros, cons, and real world consequences and trade-offs involved with each approach, and articulate decisions.

What Happened for the Group

The discourse process, formally entitled *The Integral Process For Working On Complex Issues* but called *FreshAir* for this project, is referred to below either by the acronym TIP, or simply as, the process. It is derived from a general model that I had developed based on my prior action and theoretical research. Its functional purposes and their theoretical underpinnings are not further discussed here (but see Ross 2002). Its template for first developing and then deliberating approaches to issues explicitly includes distinct action-logics that complex issues evoke in various people, depending on how the issue does, or may, affect them.[8] These action-logics are characterized by capacities to perform tasks at different levels of hierarchical complexity as shown in Table 1. TIP embeds these disparate voices in various of its sub-processes, providing a structured method, context, *and the real-world reasons* for people to engage with each voice, even if it is not “theirs” on a particular issue. Some of those real-world reasons have to do with the individual’s own concerns, inviting some first-person (self) action inquiry. Others have to do with discussing the existence and validity of other persons’ concerns about the issue (second- and third-person action inquiry), inviting social perspective-taking, in Selman's (1980) terms, which expands the territories of event/experience.

---

[8] While a maximum of four action-logics are reflected as the individual approaches to deliberate, within each approach the other common, adult action-logics are given voice by reflecting their concerns or objections to each approach.

Sessions' Methodology, Analyses, And Discussion

The group's issue about tones and intentions evolved gradually, and this narrative begins by telling the story of that evolution. Every complex issue arises from a particular context. While a *tone and intention* issue could seem generic on its surface, that issue, too, emerged out of not only the design of the discourse process itself, but also out of the gestalt produced by a particular combination of factors. These included the research context, the individuals involved in it and their unique contexts, group dynamics in the various subjects and steps of the process, community history, and the local political culture that concerned participants.

Session One

The unusually thorough quality of the work that participants did in their first session laid the foundation for the rest of the process and their eventual issue. They began by identifying 39 topics of concern. As they discussed which topics were more like the tip of an iceberg (as compared to the deep base of an iceberg) they were able to separate the topics into two distinct clusters. They characterized one cluster as consequences and symptoms. It was associated with recent years' changes in the community's status quo, with those differences in the quality of life feeling like a threat. They recognized that all of the topics of concern in that cluster were directly or indirectly affiliated with local land uses. The other cluster was associated with the strains that characterized local public life and showed up in the relations of the public with its government and in the relations between local governments. They characterized that cluster as containing issues of process: "how we get the job done, relate, and communicate, how we do things, how things are working or not working." In that cluster laid the roots of the eventual tones and intentions issue they worked on. At that early stage, words they used as part of some topics' descriptions included angst, trickery, tension, strain, and other terms to describe what contributed to the strained relations, from their perspectives.

At that juncture, the next task was to select one topic of priority concern to work on in more detail in the next session. The process steps do not require or invite participants to identify or analyze the relationships between any topic-clusters they develop. In this case, however, once people saw and discussed the distinctly different nature of each cluster they had created, there was a seemingly natural desire or movement to articulate "the gap" between the two clusters. What *was* the missing link that would transform one cluster's strains *so that* the pile of its symptoms and consequences in the other cluster could get whittled down? A difficult effort, the most they could do at that point was name that the community needed a process to connect the two clusters, which was hard to do when there was a lack of a sense of community and a lack of communication. Not only did the community seem to have such a gap; at that point, the group discovered it also had one. Its gap was not finding a satisfactory way to "name" its priority concern, that missing link or process between the two clusters.

My job as facilitator in this process was to help people share and build their knowledge base together. My role did not include imposing my own thinking or analyses on the participants. Although it left some of them feeling dissatisfied to stop short of selecting a clear topic, they were tired and we had reached the end of that session's allotted time. With assurances that the next session would begin where this one left off, I suggested that once I typed up their work, that seeing it in an orderly format could help them identify and select the topic.

I believe a combination of factors probably made it hard for the group to coalesce around a way to name the new topic of concern situated between their clusters. First, at an analytic, developmental level, their two clusters represented huge systems. To conceive of a way to name that nexus would be a difficult task of metasystematic complexity in a new domain of issue analysis. Public issue analysis is not something that participants were accustomed to doing, and they would need more time to think, whether or not any of them used metasystematic thinking. Next, at a content level, some of the individuals had expressed which topics they had the most concern about, while others did not have a stated preference. As they tried to name the new topic, they may have been struggling to assure that the already-identified topics of greatest concern would still be accommodated. In their concerns about getting to the roots of the difficult relations and consequences of them, I had some sense that it was almost like they were searching for a “magic bullet,” a quick way to make that missing link appear. If people harbor hopes for such rescues, it can naturally lead them to avoid making a commitment to a possibly sub-optimum choice. Finally, there are choice-points like this throughout the process, and it is not always comfortable for participants to engage them.

Session Two

As the next session began, participants felt no closer to finding words to describe that topic, yet everyone felt that they shared the same grasp of what they meant, even though it did not yet have words. That was sufficient for me to suggest that we just dive into the steps to turn the topic into an issue, which would be a more specific set of concerns that they could work on through the rest of the sessions. It takes a thoughtful process to get from the broad, implicit generalizations of a topic (whether it has words to label it, or not) to identifying a specific issue or problem. Regardless of what kind of topic concerns people, it has identifiable impacts and causes that people can cite from experience, or that they fear they will experience. Some or all of those may be bona fide issues that can be worked on. For this group to sort through the impacts and causes of this hard-for-them-to-name topic, its discussion included anecdotal stories that unpacked it and revealed more about the concerns.

One person reported that his stances on certain issues in the community seemed to put him on the police department’s list of people to track and then harass with traffic tickets over minor things. Another reported that family members had said the city’s atmosphere had been antagonistic across the forty years they had lived there. Some people reported a number of frustrating, unsuccessful attempts to get basic public information from City Hall. Some told the stories of citizen referendum efforts over the years, and how each one left more damaged relations in its wake regardless of which side “won.” Despite citizen outcries, mostly in connection with land use issues, successive city administrations would pursue their own agendas. There were chronic difficulties in obtaining official explanations for decisions or creating opportunities for dialogue about them, either before or after they happened. The community politics seemed to be summed up by a resident (not participating in this study) who posted to an electronic bulletin board: “It’s hard to live here in the middle of the ‘Hatfields and McCoys.’ I try to stay in the background and not say much so I don’t risk the venom and being labeled.” I trusted that the study participants were not exaggerating the community’s troubled interactions.

Citizens' complaints about others in their community have been common in all the years I have done public issues work. They represent only some of the facets of any community's whole story. This discourse process is designed to flesh out the whole story from as many perspectives as possible to elicit as much balanced insight as possible, and therefore as much capacity to address issues as possible. The group in this non-public project did not have that benefit. Some of the participants contributed to achieving some balance by introducing actual or potential cases of officials' frustrations with citizens, and including other citizens' perspectives. For example, in the third session a participant asserted: "They're sitting around having the same meeting [that we are], by the way."

Us and *them* language was prominent in the early sessions. Yet, I heard these people describing more than common complaints. I heard them, and they heard themselves, describing in detail a very uncomfortable political culture that permeated a great deal of daily life, and the quality of that life. Through their explanations of impacts and causes, participants defined their key issue of concern, using these terms: "The issue, the problem is that citizens are unaware, frustrated, and therefore powerless, uninvolved, and misinformed." Moments later, the group coalesced around a name for the elusive umbrella topic this problem referred to: "the troubled interactions between government and the people." The group adopted this as its orienting topic. It seemed to capture the *cause* of the gap between their first session's clusters. It was at the heart of troubling things that were—and were not—happening in the community.

By the time these milestones were reached, we did not have enough session time remaining for the last step: to summarize their work into a fuller description of the issue. One person suggested that they could work on the summary from home before the third session, and all agreed. The process book had an example for reference, modeling the factual, unbiased style to use when describing an issue. This seemingly clear closure to the second session masked some things going on beneath the surface.

During the week, I received the summaries drafted by (only) two of the participants, giving me a clue. Rather than a neutral issue summary derived from the group's work, one person drafted a page akin to a manifesto that proclaimed "power to the people" in a democracy. It echoed comments that the person had made in the last session, and prescribed what citizens should do to "take the power back" from the "power elite." It told me that this person had both missed the purpose of the issue summary, and was operating on an erroneous assumption. Its tone of victimization and aggression was similar to the tone that another participant's comments sometimes had. It seemed to me that at least one, and possibly, two participants had misconstrued the research project's objectives and the overall purpose of the discourse process. We were entering the turn toward the group's tone and intention issue.

Session Three

I inserted some discussion time at the beginning of the third session so we could surface assumptions about the project and the process, and the neutrality with which issues are treated in both. It answered a couple persons' previously unasked questions and seemed to afford more clarity in general about what we were doing, and why. In the course of that discussion, the person who wrote the manifesto-type issue summary explained why it sounded the way it did. One reason was the perception that the group was quite homogenous, that everyone seemed on the same page about motivations and what they wanted to be different in the community. The inference seemed to be that if the group had a shared goal, then it was appropriate to summarize the issue with prescriptions for addressing it. The underlying assumption seemed to be that everyone would agree on the same prescriptions because their ultimate goals were similar.

To that stage of our work, I too had been viewing the group as homogenous. Discussions in this session began to shift my perception. One outcome of this first discussion was that the manifesto-writer said that it clarified for her why the issue's summary description had to be neutral and not prescribe solutions, and also that the rawness of so many bad experiences made it "probably impossible to *feel* neutral."

The agenda for this session was very straightforward. The first task was to freely brainstorm all the conceivable actions that could be taken by anyone, or any entity, in the community, to directly address the issue the group had selected. The group produced a long, diverse systemic action to-do list. Some actions were voluntary things that individuals, groups, or government could do. Some would involve administrative policy changes for local government, the newspaper, and schools. Most of them would involve public policy changes of different kinds, including how facets of local government operations were structured. The purpose of this step is to generate a comprehensive inventory of what systemic change on a public issue could require if it is undertaken.

The next task was to select only one of the actions that met the basic criteria provided in the process book. If an action met those criteria, it would signal that the action amounted to a sub-issue of the overall issue, and that it needed special attention and decision-making. The criteria help people recognize the kinds of changes that should ideally be deliberated: to decide about why an action should be done, about whether it should be done, and/or about how it should be done. Such explorations indicate the hallmark of which issues to deliberate, that they have no simple answers. Deliberative decision-making about such changes is important if they are to be understood, well designed, accepted, supported, and successfully implemented. On the surface, the selection of one action from such a list is a straightforward task. In reality, such decision-points involve some messiness, because to give priority to one subject of importance means weighing the consequences of not choosing other perhaps equally important options. (However, when many people are involved, concurrent work on a range of issues is possible.) Some groups doing issues work experience such decision-points as a dilemma, to various degrees.

At times taking circuitous routes, and with my prodding to assess which actions might be more likely to address the group's fundamental concerns sooner than others', participants' discussion surfaced the following list to choose from. Each selection was cast in the form of a question that could be deliberated. They were:

- How do we involve the whole community in deciding changes to zoning codes?
- Who needs to be included and considered in deciding zoning variances?
- How do we ensure transparency and access to all public information?
- How do we ensure accountability and protections in cases of retribution?

Narrowed down from all the possible choices on their earlier list of actions, this short list of concrete issues confronted the group with another dilemma: which one should be the issue that the remaining three sessions would focus on? Rather than briefly and informally deliberating about these four options, choosing one of them, and ending the session at the two-hour mark, the participants veered far away from that task. They began an important discussion of a very different ilk.

The discussion illuminated that participants were not of one mind about how, why, and when they should engage their overall goal, much less of one mind for choosing one of the four issue-questions they prioritized. From one perspective, the discussion was like an ordinary conversation among citizens that might take place almost anywhere. However, its context and timing made it noteworthy. It took place *instead of* making a key decision. Experience over the years has taught me to pay close attention when a group avoids a task. It usually signals that something is going on, unnamed, that needs to come to the surface. It could be something as simple as not really understanding the task to be done, or something much more complex. Thus, this was an important discussion to emerge, and I did not redirect their focus back to the task.

All of this meant that we closed the session in a state similar to the first one, with the group unable to make a selection. This time, however, the reasons for that state were very different. I spent the next days immersed in analyzing the session's discussion and the cumulative group dynamics, pondering how to introduce participants to the invisible "elephant in the room" I saw emerging: the dynamics that indicated that a tone and intention issue had to be on that list.

Emergence of the Tone and Intention Issue

As the event/experience that brought the issue to the surface, the discussion's content merits a closer look, for its own sake as part of this study into what happened, and also as a basis of comparison for what happened later. To highlight an instrumental pattern within the discussion and the political dynamics in the group, I introduce and use the Triangle Model of Responsibility (Schlenker, Britt, Pennington, Murphy & Doherty, 1994). For reading the transcript below, it can contribute a layer of coherence. The participants' discussion lacked coherence in the traditional sense, since they were unable to coordinate and reflect on the relations among the myriad points they raised (or their assumptions). The triangle model explicates some of those relations, and in doing so, coordinates the kinds of foundational issues of accountability and responsibility that happened to be reflected in the group's four issue-questions above. The model posits that responsibility is an essential part of holding people accountable and that accountability entails "an evaluative reckoning" (p. 634) that judges self and/or others. It asserts, "there are no exceptions" (p. 635) to the requirement that to make an evaluative reckoning, "the evaluator has information about three key elements and the linkages or connections among them" (p. 634) "*as perceived* by the individual who is making the judgment" (p. 638, emphasis added). Those elements are

> (a) the *prescriptions* that should be guiding the actor's conduct on the occasion, (b) the *event* that occurred (or is anticipated) that is relevant to the prescriptions, and (c) a set of *identity images* that are relevant to the event and prescriptions and that describe the actor's roles, qualities, convictions, and aspirations (Schlenker et al., 1994, p. 634, emphases in the original).

The elements defined by Schlenker et al. are couched in language that implies judging specific instances and individual actors, and they need to be generalized to apply to the participants' discussion. For example, 'actor' would apply to the class of citizens, the class of officials, or the government, and 'event' would apply to classes of events. The image of a triangle is ideal for suggesting the tensions among and between the three elements. When an "audience" is judging a situation comprised of those elements, the authors reflect that added dimension to the triangle by calling it "the accountability pyramid" (p. 635). Their explication of the model and the significance of different weights that an evaluative judgment can place on the elements' linkages is worthwhile reading, although it is beyond my scope to discuss it here. Their notion of the pyramid is germane because much of the participants' discussion reflected various judgments on others' situations, resulting in quite an assortment of such pyramids. This was because participants *perceived differently* the prescriptions, relevant events, and identity images evoked during the discussion.

With regard to the foregoing three elements of evaluative reckonings, each participant statement below that I classified that way illustrated that the person had particular perceptions of prescriptions, events, and identity images (for whatever actors it referred to). The purpose of using that model in this analysis is not to show simple support for the model. It calls attention to both positive and negative evaluative statements, and contrasts judgments with other kinds of statements. In the process of using those categories to assess statements, attention picks up on other features that could be obscure without a method to sharpen the comparisons. For example, the *scale* of participants' attention ranged from prescriptions, events, and roles at the level of citizen and official *minutiae* to larger questions of roles and responsibilities. The *scope* ranged from personal levels of distrust to political philosophy. The *type* of statements ranged from searching questions, to balanced observations, to judgments, to prescribing a decision for the small group to make about a hypothetical candidate. The *focus* shifted from arriving at non-judgmental observations to moving away from them back into judgment, like the "patterned set of influence links among members" discussed by Arrow, McGrath & Berdahl (2000, p. 43). Prescriptions, events, and identity images focused predominately on "them." Some statements in the discussion reflected negative judgments along the lines of similar statements made in the first two sessions. Half of the participants later referred to this as a "negative tone." Albeit understandable, if such a tone flavored efforts to foster positive change in an adversarial political culture, it would fail by perpetrating the very culture it purportedly wanted to change. The dichotomy between the group's expressed desire to improve the culture and the tone that characterized a number of participants' attitudes—and the silence about that dichotomy—was the invisible elephant in the room.

The discussion ensued immediately after I asked the group which of the four issue-questions (above) it wanted to select. Table 4 classifies the chronological flow of statements using the elements of the Triangle Model of Responsibility, where applicable. It is a basis for comparing the coherence, in tone and intention, with the group's later, deliberative discussion.

Table 4. Excerpts From Session 3 Discussion.

Participant Statements **Triangle Model Elements: P = Prescriptions E = Events I = Identity Images**			
Statements	**P**	**E**	**I**
Maybe we should be asking what do we expect government to do for us, what do we want them to do, what should they provide us, what's the best way to do that and not anything else. And beyond that, get out of other activity, like the development business. A lot of people feel they shouldn't be in it.	✓	✓	✓
It's a human thing, it's a personal thing: they've been elected, they're right. Period. Period. There are two ways you look at our form of government, either they're responsible to do what the people want or the government's structured so if people don't like it, they can vote you out.	✓	✓	✓

Participant Statements **Triangle Model Elements: P = Prescriptions E = Events I = Identity Images**			
Do we think it’s a power thing? Why do we think they don’t do what we want them to do?			
Because they often *do* do things we don’t want them to do.	✓	✓	✓
But why do they do things we don’t want them to do?			
Because they’re right.	✓	✓	✓
There’s a debate around government issues about to what extent do you do just what the people say and to what extent do I, as an elected official, take what people say and factor it in with what I know and experience and make the best decision I can….I think there’s a legitimate other condition there that says it’s my obligation to synthesize information and make decisions and act in what I perceive is in the community’s best interest, even if it’s different from what [some people say].	✓	✓	✓
That is a tension a leader deals with. And I also think there are things you have a perspective on, of what’s best overall for the city, that another tension is what’s best for the city as opposed to what’s best for people that live [nearby contested issues]. And that’s a tension they deal with. So where does the distrust come in? We know these are issues they deal with. So why do we distrust them? [pause] I admit they’ve done some bad things...	✓	✓	✓
And why do they mistrust [citizens] too, right? Because there’s mutual distrust, isn’t there?			
Yes, oh yeah.			
Yeah, they’re sitting around having the same meeting we are, by the way. What you just said is the basis of their [effort to meet citizens].			
[Facilitator] So if we’re asking how do we understand the role and responsibility of government, so the city, conversely, could be asking how do we understand the role and responsibilities of citizens? N___, I’m remembering you telling of a conversation with the city manager, and him asking if it’s the city’s job to educate citizens.			
Yeah.			
[Facilitator] So it sounds like there are some mutual questions, and the them is us, and the us is them: we’ve met the enemy and it’s us?			
Right.			
I have to wonder why at meetings people don’t discuss or ask questions. It almost seems as though the manager comes up with the answer he thinks is cool, and says here, I’ve done all this research and this is what you have to do if you want a happy city. And everyone on council nods,	✓	✓	✓

Participant Statements **Triangle Model Elements: P = Prescriptions E = Events I = Identity Images**			
and if any of them asks him to explain or if they could have more facts, they're accused of slowing things down or grandstanding. But policy is actually being developed by maybe one or two individuals, and of course they're the experts because, after all, they're getting paid 90 thousand dollars plus per year.			
[Facilitator] So, if you had a policy to require discussion of decisions before they're made, etc., it'd be information you don't have now.			
Right. And it should be part of the job description of the city manager, which is a big and responsible job, is that he be flexible in terms of goal setting, that it's not just his goal.	✓	✓	✓
See, this has been literally, and I'm serious now, I got into this with [a city staff person] in a fun discussion, and he pointed me to a text that's 200 years old. People have been arguing about this subject for 200 years: the responsibility of a person to do what the people want in a democracy.	✓	✓	✓
[Facilitator] But you're [the group] talking about what specific structural changes are possible to alleviate the problems you've identified. This is not up at the philosophical level.			
What problems are you talking about?			
[Facilitator] The first sentence of the summary description you came up with last week.			
Citizens' communication…			
The interactions, being alienated, adversarial.			
Part of what it comes down to though, the reasons for those is because of past experiences. And it's one thing to say they want people to call them at city hall, but it's like, what happens when you call? And then if you call them and this happens, is when you feel apathetic and adversarial. It's one thing to say we should do this, this, and this, and they should do that, that, and that, but if they're not going to do that, that, and that, then it doesn't matter if you do this, this, and this. Sometimes it's like you're in a twilight zone.	✓	✓	✓
I was suggesting a connection between elected officials not feeling it's their responsibility to do what people want, a correlation between that and the adversarial. If you want to get to the root, that's it: "I'm elected; now I'm the boss. Elected representatives can't possibly know what everyone wants, so they do their best. Vote me out if you don't like it." His argument is valid. I don't agree with it.	✓	✓	✓
One option could be a public forum to talk about what are the			

Participant Statements **Triangle Model Elements: P = Prescriptions E = Events I = Identity Images**			
responsibilities.			
I don’t understand. You brought up the point we can’t go in and strong-arm them. They’ve been strong-arming us for 200 years. We gave them the power, now we’re asking for the power back. We want more control of what you do. You’re saying I can’t ask for this because I might offend somebody. At this point, I could care less about offending them. The issue is getting power back to the people, to make them more confident to come to vote, to feel like they got control. You have to go back and take some power back and limit what their responsibilities are. See, I don’t have a good trust factor.	✓	✓	✓
It all boils down to they hold all the cards right now and the only card citizens hold is that they go to the ballot box. Citizens have to be able to talk to each other to develop their own sense of where they are, what they want. It has to be really grassroots [like neighbors talking and saying] “let’s find a candidate who will do these 5 specific things for us.” Maybe if we [this group] make a list of 5 things we want a candidate to do… This group can come up with the list, we’re a ‘neighborhood’ right now.	✓	✓	✓

Why did participants veer so far away from their task of selecting a specific issue to work on, when it would be a concrete starting point to address their pressing concerns? It is unlikely that a single explanation could account for it, given the diverse participants and group dynamics. Perhaps the options felt too objective or positive to resonate with some of the people. For example, comments in a later session surfaced both the attraction to punitive action and the revulsion toward collaboration: “It [one of the approaches] is not *mean* enough. We feel the need to punish before we feel clear to build new relationships,” and another was, “We all will have to overcome habits and even our personal revulsions.” Perhaps a sense that it would be a concrete beginning, like a commitment from which there was no turning back, induced some resistance. Resistance can take numerous forms at such points. An insight into dynamics that happen “not infrequently, especially at the point of decoding concrete situations” (Freire, 2002, p. 156) may apply here.

> It is just that in facing a concrete situation as a problem, the participants begin to realize that if their analysis of the situation goes any deeper they will either have to divest themselves of their myths, or reaffirm them. Divesting themselves of and renouncing their myths represents, at that moment, an act of self-violence. On the other hand, to reaffirm those myths is to reveal themselves. The only way out (which functions as a defense mechanism) is to project onto the coordinator their own usual practices: *steering, conquering, and invading* (Freire, 2002, pp. 156-157, emphasis in the original).

In this setting, any such projections were not onto me (with my facilitative role loosely corresponding to Freire’s training coordinator above), but perhaps onto the “them” of city officials. Whether or not that was the case, perhaps they needed me to give them a set of clear criteria to launch and guide the selection process. Perhaps because the process had increasingly narrowed the focus so that discrete issues were identified, that focus acted like a magnet that attracted all the diverse, internal stances to the surface. Perhaps, as with groups in other settings, they simply could not bring themselves to commit to one direction when there were several to choose from; especially when, in this case, they had questions and implicit assumptions just now surfacing. Coordinating all of this, without an intentional process-container to assist, can be a complex task involving the three distinct kinds of coordination described by Arrow et al. (2000, p. 42). Groups’ coordination tasks are: that of “interactional synchrony” or action; that of shared meanings and norms, i.e., understanding; and that of “adjusting purposes, interests, and intentions,” i.e., goals. The discussion certainly indicates that these factors were uncoordinated by the group at that point. However, the benefit in this case was that the diversity and confusion were out in the open. There were clear signs that the earlier sessions’ opportunities to voice a wide range of emotions, and their reasons, had not lessened those feelings’ strength. These factors made it easier for me to introduce them to their elephant.

Sessions Four and Five

Formulated as an open-ended question, the overall issue they wanted to address was by now entitled: “How do we improve interactions between government and people in ways that reduce frustration, increase information exchange, and foster citizen participation and cooperation in their government?” It would not require a huge leap in logic to connect that issue of interactions with the importance of individuals’ tones and intentions. However, given the group’s orientation toward *others’* objectionable attitudes and behaviors, the group needed a process to re-orient its attention. That process had to do two things. First, it needed to introduce *that* there was an elephant in the room, and what it was made up of. Then, it needed to persuade the group that the issue of tones and intentions was a bona fide *complex issue* to add to their short list, and select from five, rather than from the original four. I intended to make a strong case for doing first things first, and recommend they choose this one.

Arrow et al’s (2000, p. 43) work on small groups as complex systems supports the issue’s importance as the first one to address. Using their formulation, the tone and intention issue was a “global variable,” defined as “the global structure or pattern generated by the interaction of local variables [which] in turn constrains the future behavior of these local variables.” The authors describe the coordination tasks of a group (those listed above), as local variables. The implications of this interactive, mutually-shaping dynamic “between micro- and macro-system levels” (p. 44) for the future of a group are significant, and suggest the level at which interventions are effective.

> Each global variable (or, more accurately, the system that all of the local variables jointly reflect) may have subsequent effects on *all* aspects of the group’s local activity….When [the group members] are dissatisfied with the state of the group, or when outsiders notice and comment on problems in the group as revealed by global variables, this is a cue to change something. However, global variables cannot be changed directly—what needs to be changed is the local dynamics that give rise to them. Action identification theory (Vallacher & Wegner, 1987) suggests that when groups receive negative feedback from the

> environment, they are cued to focus on lower-level subtasks, rather than higher-level group tasks, as a locus for corrective action (Arrow et al., 2000, pp. 165-166).

To shift the issue-focus from a traditional community issue to an individual cum group issue for explicit action inquiry was to situate corrective action on such lower-level subtasks. For the fourth session, I prepared several handouts to present the logic of working on the tones and intentions within the group. I began the session with sharing my reflections on the previous week's discussion, introduced the elephant in the room, and walked through several handouts with them. I stated that they had a choice of which issue to select. In the previous sessions, they had developed their own logic for the four issues listed above. Now, I introduced the logic behind the new issue of tones and intentions, via another handout that listed a short series of logical statements to build the rationale. Two of those statements follow.

> Our attitudes shape our behaviors toward others. While we feel angry, frustrated, mistrustful, disrespected, and shut out, we risk flavoring our approaches to introducing this issue with those feelings. If we let those adversarial feelings dominate us, we are likely to provoke adversarial reactions in others, and keep the vicious cycle of troublesome relationships going. Since our overall goal is to end adversarial divisions and processes, we are wise to step back and carefully choose which feelings and motivations we want to flavor our public efforts.
>
> If we frame and deliberate this issue for ourselves, we should be able to accomplish three things.
>
> - Figure out what kinds of chain reactions may be set in motion if we take different approaches to introducing the overall issue.
> - Find ways to keep our feelings in perspective so we can have them, but they don't "have us" at the expense of our effectiveness on this issue.
> - Align our intentions and purposes to reach a well-considered decision (agreement, shared sense of direction) about the kinds of public relationships we want to have as we introduce this issue, and what strategies might support them.

The rationale (which addressed both the local and global variables, discussed above) seemed to be sensible to participants at least on the surface, possibly assisted by whatever trust levels they had developed toward me; they agreed to focus on the new tone and intention issue. Agreements at that time were accompanied by reactions ranging from surprised confusion, to understanding, to appreciation. That range that showed up in participants' retrospective reflections on that turning point, including the excerpts from three persons below.

> Yeah, that really blindsided me. Once it was done, it made good sense. But it wasn't what I was expecting and I wasn't sure why it was at that point in the process. After it was said and done, it seemed vital to do that, but it almost seemed like it was tacked on or that it wasn't the original intent. And I didn't understand it at all.
>
> You were seeing more the personal attitudes and the words. The words that were coming out, they were more agitated or aggressive, and it became more personal like, in their own little, what you feel inside. Well, I would probably include me, also. And it was getting away from what the topic or issue was. So I think that's why we had to get rid of that

> undertone first. And you started asking a few questions, then kind of fleshed that, and then I started seeing it.
>
> I think it really helped focus our energies in one direction in one approach. And I think we struggled prior to that [with] these topics that we weren't really sure which were the best one.

Once the group committed to this new direction, we spent time developing the precise issue-question to describe it. They couched it in these terms: "What kinds of relationships do we, as a group, want to have around the issue of troubled interactions with and among citizens, officials, and public servants?"

The remainder of the fourth session, and all of the fifth, were spent developing four very different approaches toward tones and intentions, using the process's standard issue-framing template. This produces an issue booklet that introduces the issue and contains the descriptions of each approach, which are introduced below with the sixth and last session. The importance of a group process to deliberate about tone and intention, and its relevance when the group wants to make positive change in the larger political culture was discussed earlier in this report.

Session Six

This last session that was planned for the group was devoted to the deliberation, structured by several discrete segments. It included the processes of opening the deliberative session, deliberating the tensions embedded *within* each approach, followed by deliberating the tensions *across* all the approaches, and the final process of closing the deliberation. Opening the session included reviewing the ground rules, and participants' articulating their personal stake in the issue they were about to deliberate. In the closing process, participants reflectively evaluated the thoroughness of their deliberations, summarized their conclusions and reasons for them, and reflected on the deliberative process and its effects on them.

Before listing the four approaches to its tone and intention issue that the group deliberated, I summarize the layers of activity that brought them to that point, to refresh the memory of its evolution from the processes described earlier.

1. The overall issue of concern was entitled, How do we improve interactions between government and people in ways that reduce frustration, increase information exchange, and foster citizen participation and cooperation in their government?
2. From the systemic action array it created to respond to that umbrella issue, the group initially identified four priority sub-issues from which it needed to choose one to work on in the remaining project sessions. All of them were good candidates for deliberative decision-making at a later community level and each would address a different facet of the many-faceted overall issue.
3. As the group veered from the task of selecting one of those four, evidence of a tone and intention issue emerged in its discussion.
4. It agreed to select the tone and intention issue as the one that it would develop and deliberate during this limited project. This issue was entitled: What kinds of relationships do we, as a group, want to have around the issue of troubled interactions with and among citizens, officials, and public servants?

5. The titles given to the four approaches to that issue-question were as follows.
    a. *Approach 1:* The intention and tone of preparing to organize an “us vs. them” campaign to get the changes we want.
    b. *Approach 2:* The intention and tone of preparing to take an “it’s the law” approach to enforce needed changes.
    c. *Approach 3:* The intention and tone of preparing to take a positive “strategic encouragement” approach to get changes rolling.
    d. *Approach 4:* The intention and tone of preparing to take a fully collaborative community-wide approach to work on changes.
6. Although they had qualitatively different content, all approaches were developed using the same outline to develop that content, indicated by the headings, below.
    a. We might favor this approach if we assume that…
    b. This approach to the overall issue would be best because…
    c. Examples of how we would prepare for taking this approach.
    d. This approach may be worrisome, because…
    e. Trade-offs that would be involved, including impacts on the kinds of relationships we want.

The most striking thing I noticed as the group convened and got settled for this session was the difference in the quality of its overall energy. I had expected that some sharper tones would still be evident, as they had been during the several previous sessions. This time, the energy seemed clear and open, ready, and free of any sense of struggling. That quality characterized the entire session. Two persons later expressed their surprise at this “dramatic” shift in the group. I reflected on possible explanations for this.

From some of their comments at the end of deliberating and in the subsequent interviews, I gathered that the process of developing the sharp clarification of several possible perspectives on tone and intention (to create their issue to deliberate) had contributed to the change in energy. In addition to providing an orderly structure for deliberation, the separately described, distinctly different perspectives perform that clarification service. That new clarity can lend explanatory power to understand and sort out the confusing din of internal thoughts. It is often hard for people to slow down their thinking enough to even notice their mental zig-zags of internal decision-making attempts to choose among scarcely-conceived, unarticulated options. All of the participants but one referred in some degree to the explanatory benefit of approaches based on distinct perspectives. For example, the person who had drafted the earlier manifesto realized that:

> I guess I’ve [now] looked at these things as separate things, which I probably hadn’t before. I didn’t think of them as separate, to choose this way or that. In one way, they were all bundled up together and this pulled them apart and kind of examined each one individually. And I probably hadn’t examined each individual [one]: “Well, what if I did this and not the other, what would I gain?” Seeing it like this, with the one, two, three, four, you know, I can see the differences in those.

The passage of time between beginning to develop the approaches in the fourth session, and arriving at the sixth session, may have cleared some of the sharper-toned energy. It may have been cathartic for participants with a lot at stake in this issue to have all of their sentiments, concerns, and hopes formally legitimized. By including those in the course of developing all the components of each approach, the process legitimized a wide range of diversity—the participants' and others'—even before getting to the stage of deliberating.

The content and quality of thoughtful deliberations are best reported by allowing them to speak for themselves. This unique event/experience deserves to speak in its own voice. It was a group of people conducting a truly deliberative action inquiry into their tones and intentions, within the two-layered context of (a) larger concerns for the adversarial political culture and (b) being intentional about potential impacts on that culture. For this reason and to convey the deliberation's own whole story, the Appendix is the session report that I prepared from the transcripts and sent to the participants. In contrast to the discussion segment included earlier as Table 4, the smooth undulations of deliberation's back-and-forth, interactive reasoning, which is observable in the report, indicate the sea-change in the group's coherence. Participants demonstrated the capacity to remain focused, build constructively on one another's contributions, and arrive at well-reasoned contextual conclusions about how, when, and why they may use the various tones and intentions in the community.

Those conclusions happen to reflect the pattern suggested by action identification theory, which was introduced earlier in the sessions four and five section.[9] That framework describes the pattern of shifting from higher-level tasks to lower-level ones as the effective place to make course corrections when environmental feedback indicates corrective action (Vallacher & Wegner, 1987, as cited in Arrow et al. 2000, p. 166). The group reflected this pattern in the situational hierarchy it developed for when and why it would employ actions derived from each of the approaches to tone and intention. By process design (shown in Table 3), the approaches follow a progressive sequence of action-logics with increasing complexity, i.e., the first approach was the least complex, and the fourth approach was the most complex. For example, it demands far less skill for a group to organize a campaign among like-minded people against something (the first approach) than it demands of several individuals, groups, and various entities to succeed at negotiated solutions that meet the requirements of multiple, diverse, vested interests (the third approach). Overall, the group preferred the fourth approach because it held the greatest potential effectiveness to foster *un*troubled interactions in the community by changing how public relationships and decisions were structured and conducted. As the deliberation's summary describes, the group pragmatically recognized that there would be issues or situations when a higher-level approach would not fit or succeed, in which case the next lower approach could be appropriate to try. It identified that there may be cases where none of those higher-level approaches could work and the first approach would be advisable as a last resort.

Discussion

I have two analyses of the development the group exhibited over the course of the sessions. I refer to Arrow et al's work, cited earlier, to emphasize the system level at which these remarks apply. The observable development pertains at the dynamic group level, at the level of the "global variable," which is the "global structure or pattern *generated by the interaction of local variables* [which] in turn constrains the future behavior of these local variables" (2000, p. 44, emphasis added).

---

[9] Other theoretical frameworks, including developmental ones, would have explanatory power for this common pattern. In the space of this report, it seems sufficient to use only the one that has already been introduced.

Analysis 1

The first development, already suggested above, is that the sharper combined energy of distressed concern, confusion, judgment, and frustration transformed by the end of the process. That earlier negative tone, as several participants called it, gave way to freer, open, pragmatic, and as the next section indicates, hopeful energy. "Us versus them" tones derive from dualistic action-logics that view event/experiences in such terms, pitting in-groups against out-groups. As findings from the post-interview inquiry into hopes and motivations reveal (reported in next section), the group dynamic resulted in a complex set of negative feedback loops until the last session of the process. Participants who did not, themselves, bring a negative tone toward city officials or other citizens, developed an un-voiced, inwardly negative attitude toward the several participants who *did* voice their negative judgments about officials and other citizens. Rather than articulate the attitude or associate it with specific individuals, it was safer to refer to the negative tone as "the group's" or "the people in the group."

It is worth a brief discussion to unpack how a layer of projected attitudes feeds the loops that gives a group's global variable its character. Projection is a normal part of humans' nonlinear system dynamics (Van Eenwyk, 1997). Its psycho-logic is that whatever attitudes or beliefs that an individual has but does not recognize, or is unwilling to claim as his or her own, will be unconsciously assigned elsewhere: for example, to other individuals, groups, societies, etc. In this group's case, and likely in many others, projection of attitudes played a silent role in constructing the overall negative tone. The loop began with several individuals' critical, frustrated statements and the tones that accompanied them. These were directed at the community's officials and other citizens: the "them." If no other people had a reaction to these statements, there would not have been a negative feedback loop at all. However, four people *did* have reactions (see the next section). They developed a negative attitude toward the negative attitudes of others, creating a dynamic loop of negativity. One of those four said that he adopted a negative attitude toward officials based on what he heard from others. The result was four people with negative tones toward (primarily) officials, and four people with negative attitudes toward those negative tones. *The original three "negative" people did not mention or seem to perceive any negative tone at all in their group experience.* The perception of negative tone resided in only four other people. My analysis is that those four were sufficiently embedded in their negative attitudes toward the others' negative attitudes that they projected the responsibility for negativity onto the three vocally-negative people. The silence that accompanied so much of this non-verbal dynamic is a natural dimension of the Cognitive Thermodynamics understanding of communication within or across species, which recognizes a "dynamic complex information circuit" that does not require verbalization (Malcolm Dean, personal communication, February 2006). In summary, the feedback loops were comprised of spoken judgments toward officials and unspoken judgments of those judgments. Seven of eight participants' judgments characterized the global variable of group tone, a dynamic information circuit indeed.

These human system dynamics account for how, on a surface level, only three individuals with negative tones, in a group of eight people, could have so much power to influence. In reality, seven of the eight people constructed and maintained the negative tone. Only one participant consistently held a non-judgmental attitude toward all people in the group, the group itself, and in the community. That person's earnest, inquiring influence was not sufficient to alter the dynamic feedback loop that the others were maintaining at the level of the global variable. The Appendix and the individual portraits in the next section demonstrate that the feedback system became transformed by different attitudes and energy. The pluralistic tone the group ended with indicates the global variable of tone developed to a systematic action-logic by the end of the process.

Analysis 2

Equally significant, the other observation compares the level of task complexity the group faced at the end of the first session and how it handled it, with the level of the task complexity the group completed at the end of the last session. As that first session closed, the group had failed to achieve its self-set task to conceive an encompassing way to describe the missing process or approach that could unite its two major issue-clusters (or systems) of concern. There seemed to be the intuition that there had to be a way to describe this, but the group could not complete that task, which I identified earlier as having a metasystematic level of complexity that was beyond the group's reach. By contrast, in the last session's work, the group constructed a metasystematic approach as a product of its deliberating about tone and intention. Tones and intentions were not treated as ethereal, "soft and fuzzy" ideas detached from embodied action, but as the bases of concrete actions. Thus, the group deliberated about diverse concrete actions and their possibilities and impacts at the same time as it deliberated about the tones and intentions that may govern the strategies for them. This deliberative action inquiry spanned the four territories of experience (see Table 1) that were involved. The situational hierarchy of approaches to action that it developed through its deliberative reasoning is a tailored metasystem that unites the two original issue-clusters *by* addressing concerns about them. By the end, the group successfully conceived a complex response that completed—and qualitatively exceeded—the earlier task that had eluded it in the first session. The process of deliberating through progressively more complex approaches apparently gave it the tasks of increasing complexity it needed to arrive at an action-logic of higher complexity. That metasystematic capacity to combine disparate systems of actions to construct a new, comprehensive approach is the paramount demand if systemic issues are ever to be addressed as such.

What Happened for Participants

By devoting the foregoing space to an emphasis on the group and issue levels, I have attempted to set a meaningful context for this section about the individual participants. The scope of this report is set to focus on the tone and intention issue, which emerged from within the entire process and cannot be entirely divorced from that origin. In this section, I strive for an appropriate balance in reporting on what happened for participants within that scope. This scope-setting precludes the depth of reporting and discussion on each participant that seriously interested readers may wish to have. Reporting included below presents much less than their experience as a whole, yet inherently reflects it.

This section begins with short narratives that include participants' reports about what happened for them. After each paragraph about a participant is my brief reflective analysis and observations about that individual's participation. Following those findings, there is short section to report how participants assessed their levels of hope and motivation toward the overall issue of the adversarial political culture, then a concluding discussion.

Individual Portraits of Participants

In the individual interviews I conducted with participants after the last group session, I asked what their understandings were about the reasons for the last session's deliberative decision-making about the tone and intention issue. I also inquired into what each person learned or otherwise got out of the process, if anything, and how they could use what was learned or gained from it, if anything.

One section of the interview was devoted to exploring how participants were thinking and feeling about various dimensions of the overall issue that they identified. That issue was entitled, "How do we improve interactions between government and people in ways that reduce frustration, increase information exchange, and foster citizen participation and cooperation in their government?" I asked one question, each, about hope and about motivation as that section of the interview began and ended. Those questions were as follows.

1. If we had taken the group temperature on this issue at the beginning of our sessions (once it was identified), how would you have rated your personal sense of hope about it changing for the better? Why?
2. Back then, how would you have rated your personal motivations to address the issue? Why?
3. How does that [set of work and experiences] affect your motivation for wanting to address this overall issue? Why?
4. What is your sense of hope, now, for successfully addressing this overall issue? Why?

The presentation sequence below is organized on the basis of those participants reporting relatively fewer to relatively greater personal impacts or learnings.

Participant 1

Hope, before. "I don't think there's much hope. Not hopeful at all. Because of history. Over and over and over and over again. Not history one time, but history over and over. And not just history with [Site], but history with politicians and government and how things work. You just got to know how things work."

Motivation, before. "Well, if it's hopeless, I'm not going to be very motivated to put my time and energy into it, cause you get geared up a little bit, and you think well, maybe, you know. Then you think, oh yeah right, okay. And then the reality comes in again."

Immediately after the deliberation, this first person commented that it did not change her feelings on things, but "it's helped to clarify them and to verbalize them better." Beyond that, she did not report that anything was meaningful about working on the issue, and said she "was lost the whole way." However, she also said, "I understood in that when you're communicating, that what tone you set can, changes the outcome…all that kind of stuff, I understand all that." Yet shortly thereafter, she also said "So, to me, changing the tone wasn't going to make any difference. Now, changing the approach…" When I asked, "What's the relation between the tone and approach? Is there one?" she responded, "I think so. One approach is knocking on the door. And you can knock using different tones. So, one is a piece of the other, I guess. And, so, I don't know." Perhaps related to her identifying that one action can be done using different tones, she reported that "I've only just evolved to the understanding that people need something, a plan, whether [or not] it's *the* plan, they needed something that says here's an idea of a plan to follow, otherwise they'll go crazy about it. That just became concrete in my experience with my board. So I'm supposing there are things from this experience that helped me come to that understanding, but I couldn't be specific as to what."

Motivation, after. "Slightly motivated, but again, as we talked before, I'm not going to get involved in politics in this town because unless you are willing to jump in 100% and put it out there and be willing to bank everything on it…. You can jump in and take a chance of winning, or you can stick your finger in and know it's going to be chopped off. I need my fingers. So, I'm just not going to go there to do that."

Hope, after. "Obviously, the problem's getting bigger and bigger, and hope gets less and less. Not hopeful. Because of this interaction [in the project] I have looked at some things, as far as I will, gone back to reading the opinion page, and that's the same old shit. Nothing. Oh yeah, that's good. It's like I thought it was."

Participant 1. Analytical Reflection and Observations

Compared to the other participants, this person was the least engaged in the issue. One objective sign of this showed up in the session and interview transcripts: she did not ask any questions, nor express curiosity or wondering about anything; rather, she consistently made declarative statements. Most of them were complete, logical thoughts, indicating a formal action-logic. The apparent absence of curiosity also appears above, as she was content to end her thinking with its unresolved contradictions. One of the several individuals whose own tone helped to surface the issue, this person's past experiences had led her to confine her community activity to volunteer efforts that did not interface with city officials. She indicated several times that the tone issue lay with city hall and it was a "futile effort" because "we don't have any control over the reality of politicians" and she was sure that that would not change. She was explicit about not feeling personally related to the issue or invested in it. She had no logical basis for engaging the issue. The issue that she *was* interested in, as she discussed it in both interviews, reflected a small but significant change in her strategy for addressing it. It did not appear that she was aware of the transition underway from formal to systematic action-logic in that domain that her descriptions reflected. It may be that the reflective nature of the tone and intention issue affected her in ways that she did not notice. Unlike the first interview, in the second one she made several self-reflective statements (one is included above) that were transitions to or fully reflecting systematic thought.

Participant 2

Hope, before. "Hmm, not very hopeful, I'd have to say. I'm pretty pessimistic. From what I was hearing, it had been that way for a long time. I'd heard about various different kinds of attempts to try to change the interactions. I know N___ a little better [than others], and I respect her, and to hear her say stuff coming from city hall doesn't make sense sometimes and there really is this kind of antagonistic interaction. And I think also, too, because people who were trying to make changes had such high emotions about it, and such negative emotions."

Motivation, before. "Not hopeful so, I'd say, not motivated at all to slightly motivated. Because I was there and bothering to think about it and interact, so that's some motivation. Although, whether I was motivated to be there and interact because I was hoping to change the issue, or because I was getting other things out of it, that was probably more accurate reasons for my motivations."

Immediately after the deliberation, and iterated in the interview, this person expressed appreciation for learning the value of long-term thinking. She explained that she came to that by the deliberation helping her to "understand that there are multiple options to choose from with tone, and people can make a better choice if they thought through what the likely outcomes of those choices would have been." Apparently making some new connections, she explained, "I probably wouldn't have thought it through to that degree. I would have just said, 'Am I going to take a friendly tone or am I going to take a more aggressive tone?'" She said the "whole deliberating about tone thing helped me keep that more in mind, how the tone I take and the intention I have when interacting with other people can affect the outcome, apart from what the words are actually saying, and that's been really valuable." Even though "the process is bigger than easily fits in my head," she learned the value of using different steps to "understand what people think is a problem, which of those are just surface parts of other problems, and looking at who the problem affects and where they originate from."

Motivation, after. "I would say, up to slightly motivated. But there's so many other things beside that would affect motivation, because more options, some of them just little steps, but still steps toward improving the situation, and I think then it's probably the just the emotional part of people feeling more empowered as a group maybe like brought me along with it."

Hope, after. "I'd still be slightly hopeful, because it seems more possible now. And I think just getting people to think about the kind of relationships they want when they interact is maybe a step in right direction, and taking the focus away from all the wrong, all that problematic specific issues, and more on something maybe they can affect, the interaction between them and another individual."

Participant 2. Analytical Reflection and Observations.

As a recent arrival in the community, this person exhibited a neutral yet engaged attention to the issue that was unaccompanied by history or apparent biases. Throughout her first interview, her discussions about issues relied upon formal logic, some of them in transition to systematic stage. As the statements above indicate, the value she placed on tone and intention at both the general and interpersonal levels has a utilitarian, goal-directed, single-loop nature: it can affect "outcomes." However, she formed new systems of relations: she did not isolate outcomes from a process of collective and individual reflection that would support better choices to arrive at those outcomes. Rather, she developed full systematic connections between reflection, actions, and outcomes. She seemed to associate long-term thinking with the reflective acts of "thinking through" and "keeping in mind." A number of her statements in the second interview, and the new insights reflected in them, indicated she was using the insights into several issues in a double-looped systematic action-logic.

Participant 3

Hope, before. "I would probably be not hopeful at all or slightly hopeful, because it was really a very decisive split, it seemed like. I mean, it seemed like a lot of frustration, a lot of past efforts, a lot of dead ends, a lot of frustration. And it was very personal for a lot of the group, the temperature sounded pretty high on the personal front. So, I would have thought not hopeless, but it was going to be a struggle."

Motivation, before. "To me it probably would be at the other end of the extreme, very motivated. I guess I like a good fight. I don't know. I'm a champion of hopeless causes."

Immediately after deliberating about tone and intention, this person reported how it shifted him out of "being caught up in" the earlier group tone: "In the beginning, it was all directed at specific individuals, it's grown to a bigger picture. It was easy to get caught up in that. Now it's more refreshing." He felt that the purpose of re-framing things in terms of "how do we really want to address this issue" was about "how we wanted to be representing ourselves in our intentions." He thought that that accounted for the "pretty dramatic shift out of the combative mentality," and used the analogy of "warring parties going to the peace table." What changed for him in the deliberation was the refocusing, that "it wasn't so much the individuals as the process and the system [so] instead of griping at individuals or events, step back, and it grew into a bigger issue," and "that's how it changed for me." He reported that he "learned or relearned being a little more appreciative of different perspectives." Extending that further, "I think it maybe changed my perception, that community includes a lot of different parties coming from different perspectives, [who] a lot of times you don't really perhaps think about, that have an interest in an issue." He views a business as a community with underlying issues, and "very much learned, I think, how to get all of the issues and how they're potentially interconnected."

Motivation, after. "I think it would still put me in that pretty motivated to be involved, because I think the way that we framed it and the way that we ultimately ended up looking at it, it seemed like a solvable problem, a worthwhile problem to spend energy and effort on that could be used as a model for a lot of communities and relationships."

Hope, after. "I think coming out of it, it would be pretty hopeful, because I think [after] that real frustration and divisiveness, I sensed people had a sense of hope and a new approach, a new way of looking at it. I don't think it's any less of a, I mean it's going to take some real effort, but I felt very hopeful that if people proceeded with that, that they would have some success with it. So, I probably have flipped, going in and coming out of it."

Participant 3. Analytical Reflection and Observations

As someone who did not live in the community, but worked in it without involvement in the community life, this person also exhibited an apparently neutral yet engaged attention to the issue that was unaccompanied by history or apparent biases. While he said that he had gotten caught up in the group tone, that was not observable by his tone and behaviors in the sessions. Retrospectively, I could tentatively link one joking suggestion he had made about "throw the bastards out" to his feel of being caught up. It appears that, for him, being caught up in the tone developed out of group conversations with a narrower than usual (for him) focus on concrete individuals and events, which happened to reflect others' negative experiences and led to the group tone. Statements he made in sessions and the interview indicated that his usual orientation is at the system level of processes. Thus, it was "more refreshing" when the tone and intention issue eventually rose to that level. Through internalizing these event/experiences, his conception of *community* developed to the metasystematic level, as did his reflections on the discourse processes that complex issues need.

Participant 4

Hope, before. "Probably would say slightly hopeful, because I feel like some people were very pessimistic about the problem, feeling like it was so deep, so intense. And I feel I'm relatively new, and I don't really know what's going on, so I need to take some of that, they've got a lot more knowledge and experience than I do, so I have to take some of that on faith. But also, generally, as a person, I am optimistic, and think there are usually solutions to things if people are willing to work on it and engage with it. So, that would modify that a little bit for me."

Motivation, before. "Probably I'd say slightly motivated, because it wouldn't be the issue I would pick necessarily, it's not the thing I feel a great deal of passion about. Probably mostly because I'm new and because I'm so involved in what's happening here [at place of work and residence], my available time is really low."

Immediately after deliberating about tone and intention, this person preceded her reflection on the deliberative experience by referring to the course of the six weeks. She said, "I've learned a lot. I don't know that much has changed tonight, but I understand more about each approach, the options, what are the dividing lines. Breaking them apart and looking at them as separate strategies is helpful, to pull them apart." She viewed the purpose and contribution of deliberating as "clarifying and focusing." That came out of the processes that "help[ed] the group really wrestle with the pros and the cons of each one…to talk it out enough that people understood them and kind of wrestle with the reasons why to do it and not to do it, so that the group was making some intentional choices. Instead of falling into a default habit, they were really looking at their options and choosing one." For her, personally, "the thinking about intentionally choosing a tone to respond from is helpful." She was able to reflect on and describe the session methods and their progressive purposes, and reported that with further thought and the support of the materials, she thought she could transfer her learning and the process to other group environments for working on issues and decision-making on them.

Motivation, after. "Probably bring it up to moderately. Yeah, I would say having the list of actions, but also more than that, having a sense of who else is interested, or having connections with some of those people, that, partly it's the concept of what happened, partly it's the relationships of the process of what happened, that could make me feel more motivated."

Hope, after. "Somewhere between slightly and moderately. I think that it feels a little more hopeful, because I think people made some of the connections, they've thought through things a little more. They're not stuck in that place of just being reactive, that they've given it a lot more thought and have more perspective. But I also know how hard it is to make real, deep changes like that, and how the change that needs to happen depends on others changing their behaviors, as well as the individuals changing their behaviors, and that's always a hard thing to do. And it feels like such a big, intense, deep, issue, that I don't really feel, don't think that I can be too hopeful, because it will take a lot of time and a lot of work to really change. So, I guess it depends on what time frame you put on it, for successfully addressing it. I would say at least 10 years, that it would take at least that long to see really transformative change. I could see smaller steps in the next, like, two or three years, but significant change seems like it would take that long, 10 years. But I don't really know, I've never been to a city council meeting, I don't know… it's just based on those interactions."

Participant 4. Analytical Reflection and Observations

As suggested by the more distanced references above to “they” (as compared to “we”), this person did not carry a personal stake in the issue. She was one of the two participants who had recently moved into the community, and exhibited an apparently neutral yet engaged attention to the issue that was unaccompanied by history or apparent biases. Her observable behaviors during the deliberative session and her statements suggest that her internal stance toward it was as an interested participant-observer of the process. Her various observations and interpretations indicate that viewing issues and interpersonal dynamics at systematic and sometimes metasystematic levels was familiar territory. Even so, “I was surprised to see the group moved so far… especially since I missed the session right before the final session, for me it felt like a really dramatic change.”

Participant 5

Hope, before. “Oh, I was very hopeful, because that was a very powerful group. I don’t know N___ or N___, but I think I knew everyone else. And if they decided that’s what they wanted to work on, it would get done.”

Motivation, before. “Mentally, very motivated. Physically, like, am I going to put the time into it? I’d say moderately motivated, at the beginning. Maybe moderately, or even kind of depressed, maybe even slightly motivated. I mean in my mind, I think yeah, this really needs to be done, but it’s been so nasty lately, am I actually physically going to do it? Ah, it’s just, you get depressed with all the issues, and the attitudes, and stuff. And a lot of these people are my friends, personal friends. So, I’m limited. I have access in a certain way, but I’m limited in a certain way, too. So, yeah, beats you down. What am I going to say, what am I not going to say. Kind of gets you tired.”

Immediately after deliberating about tone and intention, this person could say only that she “just learned a lot. I don’t know how it’s changed. It’ll take me a while…” Later, she was able to answer her earlier confusion about why we did the tone and intention issue, reflecting, “Well, now, it makes sense that there’s different attitudes or ways to approach this problem and that’s an integral part of what the problem is. So it was confusing to me why we didn’t even start off with something like that, or at least, it would be a part of all this. But that it *is* the problem, it *is* the tone, that’s what we’re objecting to, is the way things are done. Some of it is what things are being done. And that addresses that, that we need to act the way we want them to act.” For her, “one of the best parts about it [deliberating] is getting at the different perspectives. Like I said, you can get lost in yourself…. But it wasn’t apparent to me how it would affect the solution. I thought, well, we’re all going in the same direction, so it doesn’t matter. We just have different energies. But I think it would have made a huge difference in the end. This is a way to articulate that.” Although she did not elaborate, she reported, “I found words for articulating feelings.” She valued “getting insights onto perspectives,” and learning the “universal tones, [which] I find real interesting,” and “that things are complex but they can be divided, and that there’s lenses that you look through things and try to separate them.”

Motivation, after. “Well, it just reminds me that it’s just a lot of work. And towards the end, I felt more energized and willing to put in the time. I thought, let’s pick one of these, and do something. I’m quite motivated. I felt reminded about things and felt energized that there’s other people interested in it, even if they're coming at it a different way and for different reasons, that's fine. I thought, okay, maybe it's time to put more effort in it. I don't know…seemed like it was a way of putting words to things I was feeling, once you have the words, and you can work with it, so it makes it more concrete and more focused."

Hope, after. "I'm very hopeful, because, it's a perfect time with change in [city] administration, I have the time, it's inspiring, all these powerful people that are interested, so, I think, maybe we will see something good."

Participant 5. Analytical reflection and observations

An established and very active resident of the community, this participant did not contribute to the negative tones in the group. Her contributions took the form of searching questions, introducing perspectives of officials, and other balanced forms of engagement in the discussions and deliberation, indicating her metasystemic action-logic in this domain. Her use of "we" indicates that she felt very much a part of the group and the community, neither distant nor detached. She had a long-standing concern to figure out a way for city officials to "know what the community feels," and had not been able to conceive one. This was closely related to the gap the group had in the first session, unable to conceive how to connect its two clusters. After participating in this issue's work, she did construct a metasystematic connection in the form of the principle, above, that "we need to act the way we want them to act," and developed a long, sophisticated line of metasystematic reasoning about what it would take, and why, for city officials to know how the diverse perspectives in the community could be heard in un-manipulated, un-biased ways, and acted upon.

Participant 6

Hope, before. "I guess between slightly and moderately, because I thought well, something might come out of this, that it'll work, or I wouldn't have gone to the meetings."

Motivation, before. "Well, I'd say very motivated. But only if I could figure out something to do that I thought would really work, and that, I can't do it myself. [Because] I'm just built that way. I'm a glutton for punishment. I don't know what to say. You know, in a sense, you beat your head against the wall a lot of the times. But sometimes you don't. And when you do get some kind of a breakthrough, it's really worth it."

Immediately after deliberating about tone and intention, this person shared a lengthy reflection, which included the earlier quote ("I guess I've [now] looked at these things as separate things, which I probably hadn't before…."). Her interview was sprinkled with reflective insights, some perspective-taking, and conclusions drawn from the experience, perhaps summed up when she saw the issue as the way to get to root causes and "that if we were more agreeable, we'd be more agreeable regardless of who the 'we' was or what the subject was. If we were being agreeable, maybe we'd find agreement." She had been considering the issue, and what she wanted to do about it, in the almost seven weeks between the interview and the last session. "I think what came out of that session, was that in order for tensions to be lessened, it can't start out, anyway, as an adversarial thing." Referring to a post-deliberation, long-term plan and design for a community network she embarked on with the participant in item 5 above: "The goal is to remain as neutral a platform as possible. And that's changed. I mean, I began, because the situation is adversarial now, feeling the need to, basically, build a defense mechanism….But the activity of getting off the horses first, I think, is probably necessary. It's not something that I am personally real comfortable about. It makes me nervous. I feel safer on the back of my horse. And I'm sure that they probably do, too. But, I think that if everybody gets off their horses, then I think maybe we'll be able to…we'll just have to see how it goes… we won't be any worse off than we are now." She reported that much of the process was "foreign" to her way of thinking and she felt confused. "But sometimes when you're confused, then you're walking somewhere you're not used to walking. Maybe it was a pattern of discovery to have everyone walking around confused for a while so you reorganize your thoughts. That was one of my conclusions."

Motivation, after. "Oh I'm probably equally as, probably a little more motivated than I was before. I'd say I'm very motivated, because I sense there'll be more helpers, and every time I get people talking to me they seem they're on the same page, they may be more or less organized about what to do about it, but I think if it can be intelligently set up, a mechanism intelligently set up so people can access it easily, I'm pretty convinced."

Hope, after. "I don't know, I'll give it a shot. I mean, why not hope, you know? I'd say between moderately and very. Very hopeful is pretty sure of success. I don't think so. [But] I think we have a shot at it, and there's a lot of reasons it could run of out steam, not because it can't work, but because it ran out of steam. I really think it could work. I just do."

Participant 6. Analytical Reflection and Observations

This person was a long-time active member of the community, often involved in citizens' various campaigns. She was one of three whose experiences had contributed to the negative tones that others experienced. The early openings she exhibited after the deliberative session were likely nurtured along by her close association with the friend-participant who recognized that "we need to act the way we want them to act." It seems likely that the openings and unbundling of the perspectives done in the last session prepared the ground to internalize her friend's insight, and to fertilize ideas for a new communication system in the community and actions based on that new principle of interpersonal relations. That new project conception is a meta-system that integrates the one's desire for a system for officials to know how the community feels, and the other's desire for a system for the "community organism" to "know itself." She demonstrated systematic action-logics in general issue discussion and about the community organism knowing itself. Her action-logic in the domain of troubled interactions transformed from formal logic's "us vs. them" framings, to the systematic level, accounting for the radical change in her tone.

Participant 7

Hope, before. "I would have been slightly hopeful. But not really hopeful, because I started listening to people in the very beginning, a lot of people, and they were so gung ho and so advocate about their issues, you know. It was like just so stern, this is how it is, this how it's going to be, you can't get anything through this way, and it was just… And so I didn't think it would be very hopeful, that they would turn, because they were so, you know. They were just like me, if I have a set thing in my mind and that's the way I've thought for years and years and years. I just didn't feel very hopeful, that was why."

Motivation, before. "I would have been slightly motivated. I don't think I would have been too motivated as far as the group was concerned. Actually, I didn't think I'd get that much out of the group per se, I thought I'd get more out of the actual processing of the work we would do, but not necessarily the individual people because, there again, it goes back to the first, because everybody was so stern about their ideas."

Immediately after deliberating about tone and intention, this person echoed another's comment that it helped to clarify and verbalize things better, then stated that "I came with an open mind. I can just see things a little clearer, how to deal with a lot of different things." Reflecting on how she reacted once the issue was introduced in the fourth session, she conveyed that she had been assuming "this is how everybody acts: cut and dried. And this is the issue. That's when I noticed it, not till you brought it up, then I could see it." The experience with the issue seemed to offer her both a mirror and a window. "I'm like the group, I mean, I have my ways, I'm set in my ways. A lot is, maybe, because it's all I know how to do, and that kind of gave me some other avenues. After I've used all the traditional ways that I've always done, I can back up and say, you know, there are some other ways to approach this." Along with a number of statements about feeling "excited," she told anecdotes of recent interpersonal experiences, and anticipated future scenarios, of using what she had learned. "My kids, I've been using some of this stuff on them. [One of them] just called to tell me he loves me! Because it's how I approach the situation! (laughs) It's how I approach the situation. I'm very stern and I have my ways. I always used to be like, really, like a taskmaster. But what I've been doing here lately, I've been using what's upstairs…. Basically, I'm thinking more of, not so much the feeling—I mean I have the feeling and the compassion—but it's how I deal with it intelligently, how I approach it intelligently. Because I can feel compassion for it, I can feel motivation, all those things, but that doesn't mean that I'm going to get or be able to deal with those issues just because I feel that way. I've learned that there are different ways that I can handle a situation, and not necessarily *my* way, but how to handle it according to who that person is."

Motivation, after. "I would think very motivated, because it just kind of gets me a little bit excited as to, you know what to do. It's just like you were asking the question before, if you knew what was going on, why didn't you do something about it? You didn't know. But now that you know, you kind of have a ground-laying thing. It's just not all, 'Well, this is the right approach.' There's many ways to take that approach. It's kind of like stepping back and being able to look at it. We don't plan to live here very long. But if things come up, which I think they will in the community we plan to go to, I think I'll be a little more aware, I won't be so anxious to jump on a bandwagon. I'd be more inclined to look at the issue to see how it affects everybody. So, it's kind of motivating me, because I know how to do it."

Hope, after. "I think it's moderately hopeful, because I just saw a small portion of the people who are really involved in what's going on, on the issues in [Site]. And from what I saw there, you know, I saw a lot of hope. I saw like, the little lights come on. I saw some of them who were diehards [come] to the point now, 'Well, maybe there is.' And I think some of them said, 'Well, maybe there is another way to do it.' So, I feel pretty hopeful, as to some of the issues that will come out of it, some of the things."

Participant 7. Analytical Reflection and Observations

As she stated, this person came with, and she exhibited, an open mind during the sessions. Several years before, she had been active in an organized effort with other citizens on the 'winning side' in one issue, but she seemed to regard it as a functional activity that did not carry a lingering or sharp edge. Her activity and experience in the community was otherwise unconnected to city issues, and she did not have a basis for sharing the negative tone others had. Her excitement was in discovering that she had new options that transformed her assumptions that there was only once stance available to take in situations. Now she was "intelligently" tailoring her tone, intention, and behavior to situations she found herself in. The event/experiences of working with the different action-logics while developing the issue's approaches and playing a participant-observer role in the deliberation seemed to open these windows. Her thinking about issues of concern had already demonstrated metasystemic conceptions. Now, her anecdotes indicated that this early stage of enjoying and experimenting with her budding metasystematic capacity in the pervasive domain of interpersonal relations had a focus on watching the different approaches she could adopt, in relation to how they met and adjusted to the perspective and situation of whomever she was having an interchange with. Her phrase, "to handle it according to who that person is" was a consistent element in her anecdotes and future scenarios. Her delight in this new way of being was palpable.

Participant 8

Hope, before. "Temperature-wise? Freezing. *[not hopeful at all?]* No. *[Slightly hopeful?]* No, because after seeing over 200, 2,000 years of the same things going on, what does that tell you?"

Motivation, before. "Really not motivated. Confused and scared. *[So, if you were confused and scared, you wouldn't be motivated?]* Right. I would be motivated to the point that I needed to find out more information, so I would probably start digging for more information. Would I act on it? No."

The last participant to present here was unable to attend the last two group sessions due to family illness and another emergency. He was a fully active participant in the first four sessions, and was one of those who brought a combative tone into the group. He considered himself an active member of the community, although he reported that he had never attended any public meetings or citizen efforts before. His active-feeling investment was getting its first public manifestation with participation in this project. His vociferous complaint was the frustrating lack of information he could get from the city when he needed it to inform his various decisions. The need for information and people's rights to have it was a passionate mantra. Initially, he had some confusion about the tone and intention issue, fearing that it would mean his perspective would not be permitted. The fear was allayed during his participation in the first of the two sessions that developed the issue's approaches. When he missed the following session, I sent him (and the others) the full issue booklet, which he used to study new handouts and the remaining approaches. When he had to miss the deliberation, he studied its written report and summary.

By his use of these experiences, he transformed the meaning he gave to "information." "Yeah, how to define the issue. I kind of speculated it was information, because this is what I felt. Before I started this program [the research project] I pretty well gave up, I threw my hands up, said we're not going to beat government. But … now I can understand, when I don't understand something, I look at it from every angle." After relating a conversation to serve as an example of how it had changed his conversations, he explained, "I normally wouldn't do that. I would pick something to say, and then I would pick it apart, and build on it. I didn't do that. I actually stepped back and looked at it from different angles and different ways of thinking….And said, ‘this is what I would think about and these are the things I would consider [if I were you in this situation].’” He found that when he developed these new systematic-level conceptions that he was creating new information for himself and others to use in decision-making. “This gives you more access to information, because you got to look, you have to think, you have to analyze things more, listening to yourself, so you actually get more information. So, it helps tremendously because you’re building your knowledge level, and building a better understanding of what all has to go on to be in this universe, to even be here. I mean, it’s amazing.”

Motivation, after. “I’m more motivated to try to make changes. I would say between moderately and very, because I wanted something better for my kids. And I want something better for my wife. I don’t want to just come to a house. And be in a house with a couple friends on the block. And I don’t want to feel like an outsider to another group of people. I would like us all to feel the same, like this is our home, and have a good time and experience each other. Because *I* want to. I would like to make the changes. But I’m kind of scared to do it. I don’t know if I’ve got what it takes to be able to do it mentally, physically, or verbally, so it kind of scares me.”

Hope, after. “I would say, moderately, because the more people I get involved with and speak with, hopefully at some point they would see that these are the changes that need to be made and be willing to help me, to get them done. Because I really don’t see nothing coming out of it [if] we’re going in there turning wheels, covering issues we’ve been covering, yeah it might change for today, I’m not looking for here and today. We can change it one day, one week, one year, ten years, I want to change it.”

Participant 8. Analytical Reflection and Observations

This person maintained his passionate mantra about the need for information, but with qualitatively new meanings and ways to access it, including self-reflection. Its application extended to other people, including city officials: the information everyone in the community needed was knowing each other’s opinions and what angles they had looked at in arriving at them. From his earlier stance, he arrived at the conclusion that “I gotta quit looking at it like an us versus them thing, because it’s not an us versus them: it’s a ‘we.’” He no longer wanted to exist in an in-group/out-group divide. His anecdotes revealed that he had begun to take the perspective of multiple people in one situation and put them in relation with each other. He had “more concern for other people.” He found that this practice of stepping back to look at different angles resulted in stepping out of the strong emotions that previously held sway over his tone and behaviors. “I got more tones. Before, I was pretty limited. Two tones. Their side, and my side. That was it. I’m using it with my wife. I’m using it with my kids. In the process, I’m getting better. I’m learning different ways of thinking and acting. So, it’s helped me with my family, and my life. I use it every day, in my way of thinking and living. It’s changing me. It’s going change me. I’m curious to see what I’m going to be like in another 20 years.” He had emerged from a self-described behavioral prison where he felt confined to a dark present, and developed a longer-ranged orientation. I had the sense that he had been open to finding such an escape for a long time, but had not had the kind of event/experiences that would help him discover that there were alternatives. His escape from the dualisms of linear thinking was a grateful change. Participating in the process “gave me a little spark to live, because for a long time, I just wanted to give up and die. It actually gave me a reason to live now.”

Summary Of Findings At The Individual Portraits Level

These individual portraits of what happened for participants indicate five potentially-progressive categories that are meaningful from the perspectives of both adult and political development. Table 5 illustrates those categories. All participants are included in the first category because they reported having at least one new insight, during or after participating in the process, which bore a connection to their participation. Seven people indicated by discussion that they had at least one specific idea of how they could use the new insight(s) in a future situation. I treated that as *learning* and included the persons in that second category. Four participants reported taking new forms of action that were based on new assumptions or insights connected to their participation, and they are included in the third category. The fourth category accommodates one person's unique experience, which evidenced a meaningful change in her action-logic that appeared to be confined to one domain of her activity, based on her self-reporting. The final category is for the two participants who evidenced operating from a new action-logic in what I categorize as their life-world. I use the term life-world to indicate that the new action-logic affected multiple domains of their activity, based on their self-reporting.

Table 5. What Happened For Participants.

Person	Frequency distribution of persons in impact-count clusters 100%	Total Impact Categories Per Person	1. Had new insight(s)	2. Had idea(s) for using new learning in future	3. Reported new actions based on new assumptions	4. Evidence of a new action-logic in one domain	5. Evidence of a new action-logic in life-world
1	12.5%	1	✓				
2	37.5%	2	✓	✓			
3		2	✓	✓			
4		2	✓	✓

Impact Item Counts		22	8	7	4	1	2
Frequency distribution of impacts in each category			100%	87.5%	50%	12.5%	25%

All of the participants demonstrated increased complexity in their thinking in one or more areas or domains. One-half of the participants' behaviors and activities (not just thinking) reflected substantive changes, based upon different operating assumptions that they developed. This is evidence of transformative learning (Cranton, 1994; Mezirow, 1991; Torbert & Associates, 2004). The most dramatic of those impacts involve the three participants that had already begun to operate with new action-logics. Valuable for the individuals personally, there also are broader positive impacts from such development. Viewed through a quantifying lens, the change in the one person who developed a new action-logic in only one domain (that could be identified from data) has potentially far-reaching impacts for the community population and its adversarial political culture. Within the domain of community, she changed her action-logic in its sub domain of citizen organizing and activism. Where she had been a force in efforts that opposed city actions, she "got off her horse" and began the long-term investment in the non-combative system-change effort mentioned earlier. The two people who evidenced development to new life-world action-logics were extending their benefits, and anticipating further extensions, in the majority of the domains identified in Table 5.

Across the participants, there was a diverse range of domains where they foresaw that the learning could be applied, and/or where they had actively begun to employ it. Table 6 classifies those seven domains and indicates which participants cited them as either anticipated or active applications. The symbol ✓ indicates that a participant anticipates a domain, and the symbol ☑ indicates that a participant described doing new activity in a domain.

Table 6. Domains in Which Participants Could, Or Did, Use Learning.

Person	Domain Total Per Person	1. Inter-personal (in general)	2. Family	3. Employed Work	4. Meetings (any)	5. Community or sub-communities	6. Group(s) (any)	7. Other issues (in general)

What Happened With Participants' Hope And Motivation

In Table 7, I report their ratings in response to the questions I posed about their hope and motivation. The questions used a simple, four point scale for both categories of *hope* and *motivation:* 1 = not at all; 2 = slightly; 3 = moderately; 4 = very. Participants exercised the option to use half points when they wanted that refinement to be reflected in their response. For simplicity, the table uses *before* and *after* headings to distinguish the timing differences the ratings refer to.

Table 7. What Happened With Hope and Motivation

Participant	Sense of Hope		Sense of Motivation	
#	Before	After	Before	After
1	1	1	1.5	2
2	2	2	1.5	2
3	1.5	3.5	3.5	3.5
4	2	2.5	2	3
5	4	4	2	4
6	2.5	3.5	4	4
7	2	3	2	4
8	1	3	1	3.5
Totals	**16.0**	**22.5**	**17.5**	**26.0**

As reported in their individual portraits, participants explained the reasoning behind the ratings they assigned to their levels of hope and motivation. Table 8 summarizes their explanations.

Table 8. Categorical Explanations for Hope and Motivation

	Reason for Level of Hope		Reason for Level of Motivation	
Rating	Before	After	Before	After
Very 4.0	P	O P S	M S	M P P S S
Between moderate-very 3.5		PT S		I M S
Moderate 3.0		I P PT		P S
Between slight-moderate 2.5	O P S	PT S		
Slight 2.0	NH NT NT NT	P PT	I I M NT NT S	I NH PT S
Between none-slight 1.5	NT		I M NH S	
None 1.0	NH NH	NH	I	

I – Issues around investment at personal level (either limited or liberating)
M – General motivation by nature, interest in issue
NH – Negative history, historical trends
NT – Negative tone of people in group/community
O – Other reasons
P – Positive personal qualities of people in group
PT – Positive tone of people in group
S – Discovered new system or method to address issues

What happened for participants at these individual levels, and the work they collectively produced, changed the “global variable” of the group’s tone, which developed to the systematic level. The group’s deliberative conclusions at end of last session reflected a metasystem of tones and intentions, and situational approaches that coordinated them (see Appendix). A new group of two formed on the basis of a metasystematic, executable plan for an approach to social change

Summary Discussion

In the multiple layers of event/experiences involved in this study, participants' learning ranged from noticing some influence in the evolution of a new understanding, to diverse actionable and employed new insights and action-logics. One of the hopeful and motivating insights gained by most participants was that there are processes and methods for dealing with complex issues and diverse perspectives. As both products and agents of the process's impacts, participants' levels of hope and motivation, and the overall group tone, realized positive development. Some of this was a result of that insight into the existence of processual methods, some was appreciation that negative tones could transform, and some was a result of learning that there are a range of perspectives and tones. Participants who had new learning about multiple perspectives and tones developed various conceptions of how they could use, or described how they were already using, that information to meet their interests and affect their own and others' experiences. Positive feedback loops of insights and actionable learning developed within the group and within the participants. The group-level competency developed sufficiently to conceive a complex, metasystematic approach toward addressing positive change in the local political culture. Participants developed more complex action-logics in either self-reflection, a concept, a principle, a sub domain of activity, and/or their life-worlds. Some of those changes were already having positive influences on people beyond the group. A new small group formed to develop and implement a newly-conceived metasystematic approach to a community network that holds possibilities for change in the adversarial political culture over time.

What happened here transpired in the context of an intentionally-designed, structured discourse process for working on complex issues. As the vehicle that introduced new event/experiences, the process itself was an integral part of what happened. It was a higher-level system in which this group system functioned. It enabled both the negative tones and the subsequent positive tones to develop and play their roles in participants' experiences. The progressive building-blocks of session-methods increasingly narrowed the group's attention, beginning with abstract topics of concern, and ending with up-close-and-personal concerns at concrete levels of tones to take in interactive contact with others in the community. It was a vehicle for participants to co-create their event/experiences, assumptions, motivations, alternative perspectives, and a wider range of free choices to act. In the course of the process, the political culture of the group transformed, a microcosm of the macro-level problem that concerned many of them in the larger community. There were overall higher levels of hope and motivation toward improving the adversarial political culture, and new, more adequate conceptions of approaches to dealing with it.

Limitations Of The Study

The primary limitation of this study is its low number of participants, which precludes drawing any inferences from the findings. Related to that issue, the sample's limited demographic and cultural diversity is a limitation. Another limitation is that no participants began the process with concrete or abstract levels of action-logics, and the process may have been a very different event/experience for persons with those action-logics, including the possibility that they may have dropped out before it was completed.

Recommendations for Further Research

Research into socially significant impacts of using this discourse process for working on tone and intention, and other more traditional complex issues, should be designed to overcome the limitations of this study, mentioned above. Comparative studies between tone and intention issues and traditional public issues should be designed to discover how impacts on participants and groups correlate with the specific subject of the issue selected to work on. Findings here suggest that a study should be designed to investigate if a tone and intention issue needs to arise organically from within the process of addressing larger issues, as it did in this study, or if the issue can be introduced as an issue unto itself that people are motivated to engage. If so, how would such introductions be designed? Another research question is that of investigating and comparing impacts on people when a group only deliberates an issue, versus a group both developing the approaches and deliberating them as this group did.

International relations expert Harold Saunders recently published another book on his work, “Politics Is About Relationship: A Blueprint for the Citizens’ Century” (2006, Palgrave MacMillan). His loosely structured sustained dialogue process developed out of watching the slow evolution of relational change over the course of dialogues between conflicted parties, which spanned years. This small study introduces the research question: how might parties to such dialogues be beneficially impacted if their efforts are preceded by a more tightly structured process, such as this, that specifically guides people through a triple-loop action inquiry into their own tones, intentions, alternative possible strategies, and assessments of potential impacts of those various strategies? How might deliberating tone and intention issues, in general, affect populations in conflicts and brewing conflicts?

In recent months, researcher Richard Harwood has been traveling the United States to promote and discuss his book, “Hope Unraveled: The People’s Retreat and Our Way Back” (2005, Charles F. Kettering Foundation). He reports, “people can no longer see or hear themselves reflected in politics and public life…. They abhor this retreat, but feel lost about what to do… [We need to] square with the reality of people's lives…tap into people's desire to be part of something larger than themselves…affirm our commitment to hope” (Harwood, 2005). Further research could indicate if the process used in this study provides a method to implement those prescriptions.

Two of the participants in this study suggested that the process should be customized for use in two other areas: family systems work, and child education. Both of them believed the value of discriminating between discrete perspectives and tones that family services and educational methods are silent about would make a significant contribution to people’s well-being and interpersonal relations and effectiveness.

Further research would be valuable to investigate how to institutionalize tone and intention issues as a liberating discipline that could embed deliberating multiple perspectives into child education, family services, and political development efforts at various scales to address complex issues.

Conclusion

Of the countless public issues I have had the privilege to work on with other citizens—on the ground "live," as intentional action research, and in assorted educational settings—this occasion of working on a tone and intention issue was rich with new experience and findings, and beneficial impacts on participants and others who share some of their life-worlds. Although this was the first opportunity to actively work with that issue, it was certainly not the first time or place that I saw the need for it. Some years ago, I summarized my thinking about "those elements that are necessary in considering how a public can address complex social or political issues in such a way that the evolution of the culture and the structures it supports might be assisted" (Ross, 2000, p. 1). The summary was based on experiences in public issues work that I had accumulated at that point. The first element that I treated began as follows.

> Address the community's most presenting or hidden needs first, those which, if left unaddressed, would likely sabotage other efforts.
>
> - Troubling relationships and their history
> - Assumptions about capacity, knowledge, power, leadership, inclusivity
>
> a. Provide a method for recognizing them because people need to become conscious of them before they can intentionally work through them.
>
> b. Provide a method for working through them because the [likely] alternative is paralysis or regression (p. 2).

Whether or not existing troubled relationships or misplaced public assumptions appear to characterize a political culture, in these decades of rapid change, with their clashes of worldviews and expectations, the potential for an increasing number of tone and intention types of issues is, itself, a pervasive—if unrecognized—socio-political issue. For this reason, this small study has socio-political significance because it demonstrates that there is an effective discourse process for people to work on such issues, both in communities and other settings both larger and smaller. As a result of this study, I have institutionalized the tone and intention issue by incorporating it into TIP's methodology as a specific option for groups to discern using before addressing other issues.

By providing the purposeful structure, the processual methods, the context, and the reasons for engaging all voices on an issue, the process used in this study is an institutionalized form of a "liberating discipline" as described by Torbert (2000, p. 80). It provides a method to precisely identify discrete issues and sub issues that comprise larger topics of concern, e.g., in this case the community's adversarial political culture. It legitimizes, respects, and appropriately uses the perspectives emanating from the range of action-logics, to conceive metasystematic combinations of approaches to specific issues, such as tone and intention, that can effectively work on the overall issue. What happened in this study was that diverse forms of human energy, motivation, and capacity were freed and could, or did, begin to engage collaboratively in social change and more complex decision-making processes and action-logics.

Another conclusion I propose is that there are valuable implications for political development, as defined earlier. When we consider the conundrums posed by perennially troublesome issues, an integrated understanding of positive event/experiences, human motivations, and adult development of new action-logics can help us transform hopeless assumptions that things will never change. We have the knowledge of the necessary conditions to liberate the conative dimension of human nature. Now, to develop those conditions is, itself, a universally-germane complex issue that demands priority if we are ever to address the serious challenges that humanity has brought upon itself in every region of the world—and in their populations' publicly common ways of relating.

Such an understanding of conation's role in human existence has much to say about "apathy" and "public disengagement." What might it say about addressing the systemic, underlying issues in conflicted communities and societies? Freeing up people's environments, for example by such methods as used here, would employ the wisdom of identifying corrective actions at the foundational lower-level tasks discussed earlier. Whole-system change, at any scale, must include the level of individual human beings and their motivations to satisfy basic needs. This small study demonstrated some dimensions of why that is so.

Finally, a word about the word *paradigm.* In recent years, "new paradigms" are announced in one arena or another with noticeable frequency. They "tend to emphasize their revolutionary dissimilarity from the paradigms prior to them" (Torbert, 1994, p. 80). The people who study and measure stages of development in the field of developmental theory use the term with a specific, technical meaning. In that domain, a paradigm is measured by the hierarchical complexity of the tasks necessary to construct a new paradigm, just as other stages are measured by the task complexity needed to construct, for example, a linear logic, a system, or a metasystem. The paradigmatic level of development is characterized by its use of methods that are quantitatively and qualitatively more complex and adequate to deal with other clashing or competing systems and metasystems. Their hallmark is socio-political dynamics that can resolve moral questions by engaging all perspectives constructively (Sonnert & Commons, 1994), practices that use all worldviews' perspectives in "recognized complementarity" to the others (Torbert, 2000, p. 80), and public discourses and social levels of organization, including societies, that effectively integrate "all members…[in the] co-construction of solutions" to complex issues (Commons et al., 2005, p. 50). Social, economic, and political issues are metasystem complexes of enormous complexity that are not susceptible to technical remedies. If, as the planet's 21st Century inhabitants, we hope to address them with an effectiveness that exceeds our history to date, we must employ genuinely new paradigms. Torbert's developmental action inquiry and the methodology used in this study operate at the paradigmatic stage. As first, second, and third person discourse methods that depend on all action-logics for their effectiveness, they embed paradigmatic complexity: "When the public discourse is extended in time, has real power, is inclusive, and establishes its own rules and agenda, and when it engages in real co-construction of its rules, agenda and prioritization of assumptions, then the discourse may be paradigmatic" (Commons et al., 2005, p. 50).

Referring to capacities that he associated with his Learning III (which equates to the metasystematic action-logic), a passionate Gregory Bateson had the following convictions.

> If I am right, the whole of our thinking about what we are and what other people are has got to be restructured. This is not funny, and I do not know how long we have to do it in.… The most important task today is, perhaps, to learn to think in the new way….The step to realizing—to making habitual—this other way of thinking—so that one naturally thinks that way when one reaches out for a glass of water or cuts down a tree—that step is not an easy one. And quite seriously, I suggest to you that we should trust no policy decisions which emanate from persons who do not yet have that habit (2000, pp. 468-469).

If we do not currently think that way—and few do—so much more the reason to institutionalize the new field of political development. Its theory and early praxis have potential for such liberating disciplines to begin to permeate our publicly common ways of relating: a new field to develop individuals, institutions, and their cultures while, and by, addressing their confounding complexes of issues. Such liberating disciplines need to be embedded in the way we humans do our important work: living, intending, inquiring, thinking, learning, analyzing, strategizing, relating, transacting, educating, deliberating, policy-making, governing, and being good stewards of our entire ecosystem.

[Editor’s note: The Appendix begins on the next page.]

Appendix

Report of Study Participants' Deliberation

Thinking and Outcomes of Our Deliberative Session

Before starting, we expressed some of our personal stakes in this issue.

- It would certainly be a nicer place to live if these bad feelings weren't here; would certainly be a nicer place for me to live!

- There's an awful lot of time and energy that's really wasted in the current situation. It would be nice to get that off our backs and be able to address specific littler issues that are interesting and often fun to solve, without this impossible monster that underlies things. This matters tonight because we'd like to be successful and have a better environment.

- Even though I don't live in the city limits, it's the closest community to where I live, so if it was a friendlier, happier community, obviously it would benefit me. Also, if there were better relations between government officials and people, government would be more effective and more would get done.

- It would make the community a better place to live. We can't solve all the problems and please everybody, but it would be a good way to establish that there are problems and there are ways to solve them to a certain extent.

- I hate wasting time, energy, and money. And we're doing all of it, a lot of people are: wasting time, energy, and money. We could use it to better serve the whole community.

- It's a case of personally learning, in case I ever find myself in that situation, there would possibly be some ways to avoid doing some of these things…so it's a learning experience.

- We had talked about democracy, and how this may be a failing of democracy. If we can't make democracy work on such a small scale, how can it ever work on a large scale? I want to see it work here because I want democracy to succeed.

- I want to see better government and better community relations. I think it makes a difference. The kind of government people live with affects people as individuals. I care about people who live here, and l live close by; I want it to be better for people.

Using the approaches we developed in our Issue Booklet, we deliberated about the different tones and intentions we could employ toward the overall issue. First, we weighed the pros and cons of each different approach, and imagined what kind of future scenario it would mean for the community if each tone were the dominant one. The following pages summarize our deliberative thinking about each approach.

Approach 1: The intention & tone of preparing to organize an "us vs. them" campaign to get the changes we want

This is the tone and approach of things that are already going on now. It's the status quo, not in the sense of a public campaign, but in the form of people finding others willing to walk into the fire with them over an issue. Such efforts have been organized issue by issue, and stir things up, but have never been organized as a long term campaign to stop the overall nonsense.

Adopting this tone to get changes made would mean people wouldn't want to participate, it's too high-intensity, certainly not worth it for people who never had anything happen to them that they had to fight against.

On the other hand, perhaps with the negative national publicity over the ____ case, this type of approach might tap into existing energies and seem appropriate given the nonsense of [that case], which seems rather emblematic of the larger issue we're concerned about.

The worrisome aspects of this approach are that it means there would continue to be winners and losers, and could make that rift even greater, although we're unsure if it could be greater than it already is. Losers bide their time, because even if someone else wins the battle, the war isn't over. It may just be the nature of the system, to have winners and losers.

But our goal is that we want to help make decisions, not keep opposing decisions or having the *us vs. them* dynamic. We want an "we're all in this together" tone. That would stop the cycle. With this approach, even if a concerted campaign flipped the balance of power, that's all it does: then "us" has the power of the system over "them." All we would be doing is trading places, and that means no change at all.

This approach works best on a specific issue that has a specific yes or no answer, like a "do you want it or not want it?" question. A campaign would have to have a specific and limited goal – such as a movement for a strong mayor, for example, or the _____ battle. It requires defined targets, and only those things would happen that are focused on by such campaigns.

They would create more ill will and tension, and it doesn't seem worth it. Targeted issue campaigns don't lead to general system change. That's what we want, but this just reinforces what is already here. However, if we had a different system, where people have a say in advance about deciding what they want, or do not want, such campaigns would not be necessary, and our relationships wouldn't suffer this long term, sore underbelly after battles.

We agreed this approach is only a last resort if all else fails. In general, we place the highest value on wanting broader change, improving relationships, and being freed of aggravation.

When would it be worth it to head into more aggravation by using this approach? We agree that land use decisions can warrant this, because they are irreversible, and dramatically affect people where they live. Homes are bedrock where people say No.

Looking ahead. The scenario we foresee if our approach to the overall issue were dominated by this tone is that it would just be more of the same: long term conflict, bad feelings, more angry folks, and more of not getting things done. Nothing would change in the long term on either "side."

Approach 2: The intention & tone of preparing to take an "It's the law" approach to enforce needed changes

This approach rests on the assumptions—some of us say knowledge—that government officials are not abiding by existing laws in all cases and circumstances. It is neutral toward our relationships with one another, because we all have to follow the law. If we believe laws are not being followed, our tone should convey we want to find diplomatic ways to get the facts on the table. If laws have not and are not being broken, we need to know that so suspicions can be laid to rest. In the meantime, this tone risks relationships becoming hostile and people taking sides, even if we all regard the law as the bedrock of democracy.

We would like to approach things with the assumption that the law is followed and implemented without favoritism or discrimination toward selected people and issues. We are concerned that patriarchal attitudes of "father knows best" at the government level lead to uneven treatment of people and issues. This approach would lead us to remove such people from office, in favor of those who do what constituents want and who take impeccable care with legal requirements.

While we see the potential for hostile relationships aroused by insisting on lawful behaviors, on the other hand, if such efforts were successful, it would not matter if those who do not follow the law and those who support them became hostile, because they would no longer be in power. We have the right to insist on lawful behavior without apologizing. This tone may generate respect, since it is the way the system is designed to work.

Since this approach does not rest on an *us vs. them* basis but rather on already-spelled out law, it is a firm and diplomatic basis for taking the high moral ground, beyond issues of relationship. It is also possible that if other things happen in the community to improve, that a shift to proper enforcement of the law will be an end result rather than something we need to emphasize specifically. We would not want this legal enforcement tone to dominate everything we do, because in itself, it is not enough.

When we turn this legalistic approach around, we find ourselves ambivalent about judgments between the spirit of the law and the letter of the law. We notice we want to hold government to a strict execution of the law in areas where we fear its misuse or abuse, yet we also want public servants to be more facilitative than rigid and dictatorial in applying the law to citizens in certain cases. If laws aren't serving well as they are written, we need to deliberate to change them, but that needs to be broad-based deliberation, not among only a select few.

Overall, we value the spirit of the law over compliance, a balanced spirit of cooperation and compliance. We value public servants striving to make laws work for all of us without impersonal rigidity. We value both government officials and citizens living within the law without the weight of fear of dictatorial punishment for mistakes.

Looking ahead. The scenario we foresee if our approach to the overall issue were dominated by this tone is characterized by antagonism and even fear, despite efforts we may make to make enforcement neutral. Legal actions of various kinds would sever communications even further. Everyone would have reason to be on constant guard, looking over their shoulders because we were not careful about what we asked for, and got stuck in it.

Approach 3: The intention & tone of preparing to take a positive "strategic encouragement" approach to get changes rolling

The main thing we like about this approach is its positive, non-antagonistic nature, especially by comparison with the first two approaches. It gives us an optimistic feel that we *can* work things out in a way that involves enough give and take from everyone to get a job done without causing problems. It means being proactive, creative, and the potential to get people excited about positive change and looking for the positives everywhere we can, including complimenting officials when they do commendable things. These are underlying modes or tones that we need in order to change the dynamics.

At the same time, there can be a concern that it would be effective in only tiny increments, because overall, it is important that government and relationships be working right. We shouldn't have to negotiate our way to proper operations. However, it does not prevent us from being assertive about what our concerns are, and we can still ground this approach in our root concern so it stays in the forefront.

Even if we adopt this tone willingly, there is a worry about how realistic it is. What incentives do citizens have to offer besides promising to not create an uproar or organize to vote out officials who don't want to engage?

To avoid the potential downside of coming up with exchange offers everyone may not want to live with, we assume this tone includes the necessity of developing good community networking. The voice of many must be brought to the table, not the voice of only a few who are ignorant of what the community wants and is willing to offer in the course of negotiating exchanges.

Toward improving relationships, it changes the tone by the prospect of going to officials and saying: "We know there has been a lot of conflict over the years, we're tired of it, you're probably tired of it too, let's find a better way to work together on things…and when contention arises, let's agree to find tradeoffs we can live with."

However, this approach assumes there is willingness on both sides, and there may not be. Also, while it may make us feel better, it could come across as weak, too, to the other "side." By contrast, if we come from a more oppositional approach, there may be more willingness in others to engage in negotiation.

A benefit of this approach is that it does not narrow options down, but can serve as a springboard for either genuinely more collaborative approaches, or for taking stances suggested by the earlier two approaches if they are needed as backup systems. This provides the tone of an initial overture, and gives all of us the time and opportunity to do our homework and figure out what we bring to the table. It would be a good, educational process for everyone, if this characterized working things out.

One unresolved downside is that some people prefer "ready-resonance" with ideas, letting natural alignments and attractions to visions bring people together, rather than negotiating our way through everything. Realistically, this approach cannot work yet, because we do not have any venues for such conversations to take place. That gap would have to be filled first.

Looking ahead. The scenario we foresee if our approach to the overall issue were dominated by this tone is one of wanting to work together enough that we're all willing to give something to get something. We wouldn't be taking stances of either "yes" all the way, or "no" all the way. We would be breaking through such either/or gridlocks, and finding a third way. We would not be going into every endeavor expecting, or looking for, a fight.

Approach 4: The intention & tone of preparing to take a fully collaborative community-wide approach to work on changes

This is the approach that captures our overall goals, it addresses the overall issue we're concerned about. We want to replace our long history of mistrust with a new pattern of trust and reduced tensions, and have a greater quality of community life. None of the other approaches strive for this directly.

But if any tone portends negotiating from a weak position, this one does. It does not have any strong positions built into it. We may have a concern that it could be easily dismissed or manipulated. At the same time, we're aware that it does not prevent us from using the tones and tools of the other approaches that have some sharp edges, as needed.

The benefit of risking this stance is that it could lead to a broad, long-term framework to get the whole community up to speed, and able to take any kind of action. That means we could work on focused issues, find ways to get people talking, find out and define the issues, and have various meetings facilitated by someone neutral when needed. Along with all this, there would be small group meetings happening all over town that make the web of connections we've talked about, a very empowering prospect.

Once that happens, information starts moving back and forth, and it's harder to steer people down a path where they don't want to go. Once they know what's going on, with communication methods that work, people aren't easily manipulated, if that should be attempted. Starting off with this tone could lead to such wide spread meetings, and they wouldn't be gripe sessions. They could be productive and educational, like learning the aspects of the laws about something of keen interest, for example, for businesses. It could also be the means to the end of fostering community, something we all hold as highly valuable.

Some of us believe that starting off this way could lead to city council finally feeling it has a way to get a broad enough sense of what people want. It needs to feel assured it knows, and this could begin to change the way it thinks about a lot of things, and change the way business gets done, for a lot of reasons.

Despite those positives, we are aware that there are people whose feelings of animosity run deep, and this tone is probably not aggressive enough for them because it holds out little realistic hope that things will change. We could, potentially, lose the prospect of their participation in community change efforts like this. On the other hand, this kind of open approach affords a soapbox for everyone, regardless of what is on their minds. They can all say their piece. In the process of hearing one another, we would begin to find things out that we need to know, that put us at greater ease, etc.

This could be too optimistic, and we might find out that no one is really interested in widespread collaboration to make change, then efforts toward our goals would fizzle. We can only hope that having easy access through such processes would start to encourage more activity. We are telling ourselves that if we threw a big enough party, a lot of people would want to come.

Looking ahead. The scenario we foresee if our approach to the overall issue were dominated by this tone is that there would be a lot fewer "us and them" dynamics. The more connections people began to have with better communication methods among them, the fewer the biases that would remain. We would be changing our perspectives, toning things down, and becoming more tolerant. It would be good for both "sides," and we'd be finding out we can agree on some things even when we disagree on other things, without the tensions and adversity.

Comparing Across the Approaches

After we deliberated the tensions within each of the foregoing four approaches, we looked for any overall tensions among them.

We characterized the differently-toned approaches in terms of which ones block other tones, and which tones are open to others. While we recognized that there can be specific situations where actions based on approach 1 may be practical or necessary, its tone is not one of choice because it pits one group of citizens against another, and acting on that adversarial basis—as we know so well from experience—leaves long-lasting scars on the community and individuals. In that sense, it is in tension with approaches 3 and 4, which have markedly more positive tones. On the other hand, as we said earlier, if we had a system in place where citizens were involved at the early stages of things, this might not be needed.

The second approach to *action* (as compared to just tone) also has potentially legitimate uses that are not necessarily at odds with any of the other approaches, but its tone of distrust blocks healthy relationships and is in tension with approaches 3 and 4, which assume some degrees of trust and willingness between people.

The tone of approach 3 could co-exist to some extent and in certain situations with that of approach 4, but there is tension between their assumptions about who is “at the table,” how they got there, and what brought them there. Approach 3’s tone assumes there are probably fewer people involved directly, and that it could be an elite few who bring others to the table to negotiate the gives and takes of coming to agreements. Its aim is focused more on dealing with specific decisions, than with changing the culture of the community. In that sense, it blocks the full expression of approach 4.

By contrast, approach 4 assumes community issues or questions require some ongoing venues for fully collaborative and community-wide involvement. It is the most open of all the tones that could be adopted. It is not in competitive tension with any of the other tones because their situational uses fit within the openness of approach 4, which indeed, may influence the others toward moderation. It does not imply taking everything on blind faith or being naïve; it accommodates realism and flexibility.

In that vein, we considered how the strong tones of approach 2 would actually “look” and play out in a scenario where approach 4’s tone was dominant. This seemed important because of the charged emotions, judgments, and suspicions that people express either verbally or by not speaking at all to certain people. We imagine the adoption of approach 4’s tone could meet people where they are, wherever they are. Eventually, such a tone characterizing relations should underlie enough new, positive experiences that people’s anger and anxiety levels would gradually diminish. People who would feel more comfortable and secure in tone 2 might relax more as the open tone of 4 leads to more information acquiring and sharing. It should also lead to the feeling of being more supported in general, rather than dependent on only their own efforts to meet needs. We do not foresee that people preferring the tone of approach 2 would feel in tension with or alienated within approach 4.

When we compared the time-and-energy demands implied by enacting each approach, we concluded that each, in its own way, could certainly take time. The tone of the energy expended in approaches 3 and 4 would be generally more positive and satisfying. This would be so because both products and relationships would be held in equal value, not sacrificed for expediency’s sake. We can imagine that proceeding on the basis of approach 4 would initially be heavier in such demands, but that in the long term, it would result in fewer urgent situations to deal with.

Finally, we recognized that another reason that approach 4 has the least amount of tension with the others, is that it does not presume a stance of telling others what to think or inducing them to react in particular ways. Rather, it assumes creating the venues and processes to work with whatever people think, even when it is in tension with others.

Summary of Deliberative Outcomes

The foregoing work helped us formulate the following reasoning and preferences, as we summarized our conclusions about tone-adoption and its relational impacts.

In this group, there is a sincere desire to build community and to be as non-adversarial as possible. We conclude the fourth approach can best support this. Values underlying this consensus include: the importance we place on healing relationships and having more good ones; wanting the democratic ideal to prevail in our community; preferring the benefits of long-term thinking for real change over short-term efforts; higher levels of information-sharing; and the tangible benefits of fostering community for its own sake.

A down-to-earth realism goes along with this. We realize that desire does not preclude using the sharper-edged tools available for doing community business when they are a last resort, or when they would be more practical and effective for particular issues or circumstances. Until we deliberated this issue, we had not been considering that the third approach existed or that it fit anywhere in accomplishing our ultimate goals of addressing the overall issue that concerns us.

We realized toward the end of our deliberations that our focus had shifted considerably with regard to that overall issue, placing less emphasis on government, and more on people. This may be because, as one of us commented, “if we’re worried about being pushed around or some of those other things that seem to be a root of a lot of this issue, the sense of building community gave us a sense of empowerment.” There may be other valuable things to understand about this shift, too. For example, it may be about interplays we intuit between processes we hope the community adopts, and the products they can produce. We did not explore this idea beyond naming that when we use ourselves and each other to solve our problems, we find out not only that we can, but also that our “products” become much more than we aimed for at the start. Another dynamic behind our shift may be quite natural: the shifts that occur as hope takes root, that we become freer to place our attention on the positives as we become less weighed down by the negatives we have struggled with. We talked about the real impacts for changing public relationships by doing very simple, positive things; for example, conveying compliments even to people with whom we disagreed about something else.

We identified that we experienced diverse benefits from deliberating our issue. A significant one was the usefulness of having each approach described separately so we could explore it thoroughly and clearly distinguish it from the other ones. This had value for the sake of considering its tone, practical usefulness, and relational impacts. It also equipped us to weigh it against the others and see how, when, or if it could complement the others.

We concluded that the first approach is like a return to a familiar ground zero, and none of us favor such a return. Our hope is that even if an issue in the future requires such a strategy, that the deeper changes we hope take root across the community will help to prevent it becoming personalized as *us vs. them*. We hope approach 4 helps such issues be seen as just being issues, which we do not need to personally identify with to the point of destroying relationships over them.

We share the assumption that broad community networking is essential to the life of the community, communication and information-flows within it, and our ability to achieve a better quality of civic life overall. We believe there may be quite a period ahead before the spirit of mistrust and adversity dissipates in the community, yet it has to start somewhere. We agree that community life that is rooted in the tone of approach 4 is the "somewhere" it has to start, even if it takes generations.

Preferences for the tone of approach 4 do not overshadow the challenges it represents to us. For a couple of us, the spirit and practice of negotiation reflected in the third approach is more familiar and easier to envision using as an individual. As our issue-framing mentioned, using approach 4 for public business implies citizens learn new skills. Leadership questions arise in connection with sustained commitment and neutrality that ensures truly collaborative efforts to meet others needs as well as our own. We wonder about people's interest levels and ability to see long term change develop gradually, without reverting to inactivity or business as usual. At the same time, we see the third approach as a viable option when the fourth does not work, for whatever reason. A real challenge is suggested by the idea of creating new venues for productive citizen-citizen and citizen-official interactions. Developing a shared imagination for what they need to look like may prove challenging, too.

As our discussions kept showing us, and the foregoing illustrates, deliberating the issue of our own tone led us inevitably to imagining how things would work in practice. How things will work is obviously up to everyone, not just this group. At the same time, our participation in this process leaves us feeling that we have more company now. Things seem pretty hopeful, and we look forward to finding ways to get some wider agreement on what kind of interactions we want to have in the community, and spread that hope in such interactions more widely.

Collaborative Knowledge Building and Integral Theory: On Perspectives, Uncertainty, and Mutual Regard

Tom Murray

Abstract: Uncertainty in knowing and communicating affect all aspects of modern life. Ubiquitous and inevitable uncertainty, including ambiguity and paradox, is particularly salient and important in knowledge building communities. Because knowledge building communities represent and evolve knowledge explicitly, the causes, effects, and approaches to this “epistemological indeterminacy” can be directly addressed in knowledge building practices. Integral theory's approach (including “methodological pluralism”) involves accepting and integrating diverse perspectives in ways that transcend and include them. This approach accentuates the problems of epistemological indeterminacy and highlights the general need to deal creatively with it. This article begins with a cursory analysis of textual dialogs among integral theorists, showing that, while integral theory itself points to leading-edge ways of dealing with epistemological indeterminacy, the knowledge building practices of integral theorists, by and large, exhibit the same limitations as traditional intellectual discourses. Yet, due to its values and core methods, the integral theory community is in a unique position to develop novel and more adequate modes of inquiry and dialog. This text explores how epistemological indeterminacy impacts the activities and products of groups engaged in collaborative knowledge building. Approaching the issue from three perspectives—mutual understanding, mutual agreement, and mutual regard—I show the interdependence of those perspectives and ground them in relation to integral theory’s concerns. This article proposes three phases of developing constructive alternatives drawn from the knowledge building field: *awareness* of the phenomena, *understanding* the phenomena, and offering some *tools* (and some hope) for dealing with it. Though here I focus on the integral theory community (or communities), the conclusions of the article are meant to be applicable to any knowledge building community, and especially value-oriented groups who see themselves fundamentally as working together to benefit humanity.

Keywords: Applied epistemology, cognitive psychology, ethics, integral theory, knowledge building.

Introduction

With the founding of the Integral Institute and its satellite organizations, integral theory moves further from "the world of Ken Wilber" and progressively toward a community knowledge building endeavor. The most recent version of Wilber's AQAL theory (phase "Wilber-V") emphasizes multiple perspectives and multiple knowledge building methodologies. This points to an important and, I think, necessary turn in the evolution of integral theory, which heretofore has primarily focused on the task of articulating models, "orienting generalizations," or meta-models describing "what is" (or what seems to be the case), toward an exploration and articulation of method itself—"how we (can) know what is." This turn constitutes a greater emphasis on epistemology vs. ontology—i.e. on the nature of knowledge vs. the nature of "reality" (though integral theory has always concerned itself with both).

At this juncture, it behooves the community to reflect more deeply upon the forms, processes, and styles that it uses to articulate, communicate, and evolve knowledge. Might uniquely "integral" forms or styles emerge and be developed by this community—forms and styles that would serve as exemplars and models for the rest of humanity? The seeds of these issues have been lying around all along, as it is impossible to develop a post-modern or post-post-modern framework without a critical reflection upon process as well as product. But on the whole, these seeds have yet to take root to produce an in-depth and *in-use* framework within the integral community.

"Epistemological indeterminacy" refers to uncertainties, ambiguities, and paradoxes in knowledge and its communication and validation. (If this technical term with its mouth-full of syllables seems overly academic to the reader, mentally substitute the less precise but more digestible phrase "knowledge uncertainty" whenever you see it.) As part of the post-modern transformation of consciousness and culture, we have progressively come to understand, to our frustration, that knowledge is fuzzy, multi-layered, constructed idiosyncratically by each individual, socially negotiated, affected by emotions and biases, and forever subject to revision. This paper examines such multiple sources of this uncertainty, and begins to address how to deal with it. In all domains of modern life, from the family living room, to the seats of national Senates, to the texts produced in "ivory towers," we can observe that many people will acknowledge the fundamentally uncertain nature of knowledge in an *abstract* sense, but that they are bereft of productive ways to *deal with* this uncertainty, and thus overlook or deny it in practical situations.

Collectively, Systematically, Reflectively Dealing with Epistemological Indeterminacy

The term "knowledge building community," as articulated by Scardamalia & Bereiter (1994), is similar to "learning community," as articulated by Senge (1990), and "community of practice," as articulated by Wenger (1998) (though each term emphasizes different phenomena). I use the term "knowledge building community" to emphasize efforts to discover, improve, record, organize, and share knowledge. Knowledge building draws on the collective intelligence of a group engaged in researching, theorizing, critiquing, doing, and synthesizing in order to progressively evolve some body of theory and practice. Though modes and methods can differ widely, all communities of learning/practice/knowledge building share certain elements, with epistemological indeterminacy as one of the important concerns.

This article focuses on the integral community because integral theory's main methodology of methodological pluralism (Wilber 2005a), both highlights the problems of epistemological indeterminacy and suggests new ways of knowledge building that can accommodate it. Methodological pluralism prescribes an openness to multiple perspectives and knowledge finding methodologies. Unfortunately, though individual integral theorists use methodological pluralism to synthesize diverse theories across disciplines, the dialog within this knowledge building community is often not epistemologically sensitive or aware. The same can be said for almost every knowledge building community, and I do not single out the (loosely defined) integral community for its faults but rather for its potential to create something new. Contemporary theories in philosophy, psychology, and sociology contain numerous insights about the nature of epistemological indeterminacy that could benefit collaborative work and knowledge building practice. However, by and large, these insights have yet to be *systematically and reflectively* incorporated into the way that people communicate and collaborate in such organizations or groups, so the full potentials of collective intelligence remain unfulfilled. This article addresses the issue through exploring the following themes.

I hope to engage the reader in envisioning what knowledge building communities would be like if they adopted methods exemplifying key insights and implications from integral theory. Similarly, I ask "what would it be like for an integrally-informed community to build knowledge in a deeply integral way?" (i.e., fully practice what it preaches epistemologically). My thesis is that one of the major aspects of doing so involves a productive, even proactive, approach to epistemological indeterminacy, i.e., collectively developing what we could call "epistemological sensitivity" or "epistemological sophistication:" an in-context awareness of the manifestations, causes, and adaptations surrounding epistemological indeterminacy.

My goal is to seriously consider the problems inherent in realizing such a vision. It will need the support of new practices that allow individuals to identify and respond to common problematic patterns in thought and communication. I will touch on the importance of these themes: social vulnerability and power dynamics, unconscious sources of resistance to awareness, the challenges in justifying the effort required to raise consciousness in groups, and the role of technology in knowledge building. My conclusions and suggestions are starting places to instigate dialog and trial-and-error implementation. Though I propose a variety of ideas, cognitive tools, and methods, it is too much to be practically implemented in total any time soon, and the reader is invited to select aspects of it a-la-carte to consider implementing. Rather than offer end-solutions, I hope to suggest underlying theories and concepts needed for any community to engage in a dialog about their own knowledge building practices.

Themes Covered in this Article

Using a methodical approach to progressively introduce its main elements, the article is organized as follows:

1. I begin by summarizing integral theory's values and methods, highlighting those aspects of integral theory that support productive approaches to epistemological indeterminacy;
2. I illustrate the extent and inevitability of epistemological indeterminacy by examining textual discourses (positions, critiques, and responses) from on-line "communities" of integral theorists;

3. I examine in depth the many and varied causes of indeterminacy in knowledge and communication, as it is only with this understanding that we can address the problems that arise;
4. In the process I show that the indeterminacy can not be removed, but that it can be minimized, celebrated, reflected upon, bracketed, and otherwise dealt with in productive ways;
5. I include a discussion of the various ways that truth claims are evaluated, and an attempt to clarify collective truth-finding vs. meaning-making;
6. I then discuss psychological and social theories that provide tools and perspectives for dealing with indeterminacy (for example, the skill of dialectical thinking and how group vs. individual needs are balanced in knowledge building communities); this leads to a discussion of how the need for certainty leads to social vulnerabilities, which in turn introduces unavoidable ethical considerations;
7. I make specific recommendations for how information and communication can be organized and tagged to ameliorate some aspects of indeterminacy (including "indeterminacy analysis" and "differential analysis," and some recommendations on the use of "cognitive tools" such as wiki technologies);
8. I revisit the specific values and goals of integral theory and provide suggestions for how claims within the integral theory community can be validated and critiqued.

I will frame the discussion in terms of three aspects of collaborative knowledge building: **mutual understanding, mutual agreement, and mutual regard** (this triptych is inspired by Habermas' theory, as explained later). The discussion of *mutual understanding* and *mutual agreement* concerns the inherent uncertainty, ambiguity, and dynamism of knowledge and understanding. Interestingly, the quest for knowledge and understanding has intrinsic *ethical* implications involving the freedom, equality, and authenticity of participants. Epistemological indeterminacy, as it involves increased levels of ambiguity, self-reflection, and openness in dialog, can also increase social vulnerability, which in turn calls for compensating increases in generosity or regard, if the social fabric is to remain robust. The discussion of *mutual regard* looks at approaches to balancing critical rigor, reflective self disclosure, radical openness to the perspectives of others, and an authentic reflection on power and privilege. I will base my arguments on the works of an interdisciplinary collection of theorists including Jurgen Habermas, George Lakoff, Jon Elster, Imre Lakatos, David Bohm, Marshall Rosenberg, Arnold Mindell, Arne Vetlsen, and Hans Kögler, as well as Ken Wilber.

Observations about Integral Theory

Depth and Span of Integral Theory

Though my purpose is to flesh out some methodological implications of integral theory in general, I will focus on the work of Ken Wilber and those colleagues that refer thickly to his work. My hope is that in the end it will be clear that my practical suggestions are broadly applicable to all integrally informed communities (and more generally to all knowledge building communities). Wilber's work is certainly the defining body of work for the integral community, and is one among several contemporary theories that provide a systematic counterweight to the materialistic, objectivist, instrumental, and/or reductionist thought systems that prevail in much of culture, politics, and academia. It does so not merely by critiquing other theories but by proposing an integrative framework that coordinates these theories and also by incorporating subjective and intersubjective matters of self, culture, and spirit. The task of formulating a model or world-view that can accommodate and interrelate scientific, economic, political, social, cultural, religious, ethical, and psychological aspects of the lifeworld is a daunting one, yet Wilber has succeeded at least to a limited degree (another rare example is the work of Jurgen Habermas, which Wilber often cites, and to which I will return).

Integral approaches give equal importance to the subjective and objective aspects of the world. Seen through this lens science and technology are not divorced from questions of meaning, identity, aesthetics, and ethics. Though Wilber's is a "theory of everything," its analysis is deepest and its application is most compelling in the areas related to spirituality and human potential. Wilber has an impressively deep relationship to and experience with contemplative practice, and his primary motivating orientation seems to be giving contemporary validity and meaning to topics including states and stages of consciousness, transcendental aspects of reality, the development of the self, and the facets of human potential. Wilber's theory integrates key insights from dynamic systems theory, theory of mind, sociology, ecology, etc., but does not explore these areas so deeply or thoroughly that theorists in those fields are likely to find new tools, models, or insights for dealing with the complexities introduced by modernity. Rather, they are assisted (or challenged) to relate their work to other fields and larger questions. The integral framework provides "orienting generalizations" from which models or perspectives can be compared and synthesized, and related to the perennial questions of the human condition.

Integralism and Post-modernity

Integral theory positions itself as being at the forefront of (post, or post-post) modern philosophical thought. It does so in the way that many theories purport to be a fresh innovation within their historical periods, but, more importantly in the way that it tries to systematically transcend and include all other theories with an all-encompassing narrative of the evolution of human consciousness and meaning-making (within which it unavoidably takes a privileged role).

The post-modern perspective is characterized by, among other things, a deeper appreciation of the uncertainties, complexities, ambiguities, paradoxes, and unpredictabilities of the life-world. This goes for both the objective world, which is the purview of science and technology, and the subjective worlds of thought, value, feelings, and human ethical considerations. The reliability and authority once given to systems such as religion, science, and governance has eroded, in part as their limitations and failures empirically come to light, but more fundamentally as we understand the inherent unpredictability of complex systems and the fundamental limitations of individual and collective human understanding and problem solving. This new understanding[1] has lead many to varying degrees of relativism, narcissism, solipsism, cynicism, paranoia, defeatism, or despair as the full curse of complexity, unpredictability, or uncontrollability is unveiled. These inevitably show up in discourse, and for the most part, we lack tools to navigate these waters. Even in intellectual communities like the integral community and academic communities of philosophers or psychologists that produce theories *about* epistemology, the *practices* that they use to dialog and build knowledge are largely traditional.[2]

---

[1] "New" in the sense that for the first time a substantial proportion of society is grappling with these concepts, some of which had been described in pre-modern times.

In contrast to the voices of post-modern despair and defeat, some, Wilber and Habermas (and myself) among them, contend that the news is not all bad—that humanity's striving for ever deeper or greater levels of understanding and happiness is not hopeless, and that the post-modern understanding can be seen as a necessary though sometimes painful step forward, providing important new tools and insights. These insights help explain past failures in terms of the simplicity or inadequacy of their paradigms.

A Definition of Integral

Before discussing the implications of integral theory for knowledge building we need to attempt to define the goals, values, and methods of integral theory. This is needed because, as discussed later, the methods a group uses to share and validate knowledge depend on the group's goals and values. There is no definitive description of the features or goals of integral or "integrally informed" theories, research, or practice, but the one given here was arrived at through synthesizing a number of sources. I give two descriptions, the first is the integral paradigm or method for knowledge building, called "methodological pluralism" (Wilber, 2005a, 2005b). The second describes the scope and contents of integrally informed theories.

The integral method, or methodological pluralism, is an approach that, "in the presence of apparently incompatible, conflicting, or unrelated data, tries to make a productive, creative synthesis of the divergent elements" with a "gracious, spacious, and compassionate embrace."[3] It takes a "both/and" rather than an "either/or" or "right/wrong" perspective, and assumes that any person or group that has put considerable and sincere effort into discovering knowledge has at least a kernel of truth and deserves consideration. Integral theories are particularly sensitive to multiple perspectives, and claim that we gain an ever-better understanding of a thing through additional (valid) perspectives. It is not simply a relativist or non-rigorous belief that "everyone is [at least partially] right," but rather an understanding that if there are differing ideas they probably come from different perspectives. Thus the point is more that all (sufficiently informed and sincere) *perspectives* are important, rather than that every idea is.

One could say that *all* theorists *think* that they are seriously and graciously considering all of the available information and ideas, synthesizing them, and only discarding those that are truly invalid, and that the integral paradigm is thus rather vapid. To the contrary, one could also argue that Wilber and other integral theorists have a *particularly* inclusive attitude. But we can go a step further to try to characterize the type of inclusivity integral theories have by describing their scope and tenor as follows. I propose that being integrally informed entails the following:[4]

---

[2] We speak here of how authors relate their ideas to others, both within the context of a single paper, and in the larger sense that a body of texts is an extended dialog among authors.

[3] Also called the "integrative method" at http://noosphere.cc/integrationParadigm.html. Second quote is from "Introduction", Collected Works of Ken Wilber, vol. VIII, p. 49. "Methodological pluralism" can also be used to refer specifically to the eight methodologies (and eight primordial perspectives) mentioned in Wilber's "Integral Spirituality".

[4] Based on Sex Ecology and Spirituality, A Theory of Everything, and Integral Psychology, and other works by Wilber.

1. An acknowledgment and treatment of the **"big three" ontological domains**: objective (it), subjective (I), and intersubjective (we) (and/or the three cultural value spheres of science, morals, and art; the true, the good, and the beautiful; and/or the dimensions of body/mind/spirit and nature/self/culture).
2. A **holarchical approach** to problem solving that acknowledges and treats multiple holarchical levels (i.e., that when the central concern is with entities at a particular level, entities at higher and lower levels are acknowledged, if not worked out in detail).
3. A **methodological pluralism** is used, which, as described above, tries to incorporate material from as many valid perspectives and methods as are available.
4. **Developmental and evolutionary** processes are incorporated into the explanatory narrative.
5. There is an attempt to discover integrative principles or models that **transcend and include** the various dimensions, levels, and perspectives described above.

Later, in the section on "Practical Implications," I will return to this description/definition in suggesting validity criteria for integral theories. Next, I summarize an analysis of the textual dialog among integral theorists, to illustrate some of the causes, effects, and ubiquitous problems of epistemological indeterminacy, and to support my claim that greater attention to epistemological indeterminacy could benefit this, and other, knowledge building communities.

Examples from Integral Theory Texts

My reference in the Introduction to integral theory moving beyond "the world of Ken Wilber" points in two directions. First is the evolution from one man's theory to a theoretical framework by and for a community of theorists and practitioners. The second is a veiled reference to Frank Visser's web site www.IntegralWorld.net, which was originally named www.WorldOfKenWilber.com, and is currently the largest on-line repository of both validating and critical writings about Wilber's work (it is an independent and "unofficial" Wilber website).[5] The critiques, debates and dialogs on these sites, while containing much insightful material, also contain much that is not satisfyingly exemplary of a community working efficiently to refine and extend a body of intellectual work. That notwithstanding, the issues that I identify below from these on-line texts and dialogs are characteristic of most, if not all, knowledge building communities.

In this section I will anchor the issues I wish to raise in this article with some example quotes by Wilber and his colleagues from books and web sites. The critiques and rejoinders are mostly taken from wilber.shambhala.com (henceforth WSC) and www.integralworld.net (henceforth IWN).[6] Since these web sites concern Wilber's work, most of the critiques are levied Wilber's text (or Wilber himself). This article is not concerned with rigorous analysis of the available responses and counter-responses within the integral community, nor is it concerned with technical debates around the content of integral theory. Also, this article is not about Wilber's work per se, but is about and addressed to any community that uses or extends integral theories. I use Wilber's work and those with whom he textually dialogs as the most salient examples, though these authors comprise a "community" in only a loose sense of the word. The examples given here are anecdotal but sufficient to introduce the issues. Thus, even if the reader does not think there is a *problem* within integral theory discourse, I think you will agree there is an *opportunity* for creative improvement therein.

---

[5] A second and more official site at wilber.shambhala.com has less material and less critical dialog, and the third major option for material are the new Integral University and Integral Institute sites, which at the time of this writing are just beginning to post theoretical papers.

[6] The "Reading Room" on the Frank Visser's Integral World web site lists over 150 contributions from almost 50 authors (see http://www.integralworld.net/readingroom.html). The page lists articles in such a way that it is easy to note critiques, responses, and rejoinders to a primary article (note that we are describing a dialog through *articles*, which are typically 5-30 pages long, not a discussion forum dialog composed of (usually quickly composed) paragraphs). That there are about 25 such responses (or responses to responses) attests to a certain level of cross-fertilization of ideas. We can also see from this

Most of the on-line exchanges lie somewhere in the middle of a formal/rigorous to informal spectrum—between the critiques and rejoinders one finds in peer-reviewed academic journals and what one would find in email and chat-room dialog. The on-line material has more "shoot from the hip" critique and more uncritical praise than articles in academic journals. One could argue that because they are offered within an environment with little quality control, that they are poor exemplars for my discussion. I will give several reasons to the contrary. First, Wilber has published very little of his material in peer-reviewed forums. The vast majority of his writings and ideas are available through his books and various (non-peer-reviewed) web sites, and the same is generally true of critiques and responses to his writing; so, these exchanges are representative of a large segment of the extant textual dialog. Second, the concern here is with practical implications to community knowledge building, and much of such knowledge building happens, even in academic communities, in informal ways; so the use of semi-formal exchanges is appropriate to my purposes. A community's knowledge evolution and meaning construction take place in articles, emails, meetings, conversations at the water cooler, etc., with the informal and more personal exchanges being at least as influential as the formal ones. The "epistemological sensitivity" discussed in this article applies to all contexts.

Finally, the integral community, taking Wilber's lead, has a propensity toward informalism, pragmatism, and popularism. Wilber's books are read predominantly by intellectually-oriented progressives and "cultural creatives." The flagship website "Integral Naked" and many published interviews with Wilber have a "hip/chick" informal and trendy style.[7] The Integral Institute is energetically *disseminating* integralism into many fields (politics, business, psychology/therapy, health/medicine, education, etc.) in addition to its knowledge *creation* activities. Though there are indications from Wilber and others that the rigorous or academic side of the work is not taken as seriously by academics as they would like, the community also intentionally incorporates informality into its products and methods. Therefore, my focus on semi-formal exchanges is appropriate to the consciously chosen tenor of this slice of the integral theory community.

I will categorize elements of the various integral theory debates according to whether the contention is about (a) the *content* of an integral theory, (b) the *method* an author uses to arrive at their conclusions, or (c) the style and intent of an author. The table below illustrates how these categories map roughly onto the types of arguments made.

---

list that over the last ten years Wilber has written articles responding to a number of his critics or co-theorists. However, some of these authors do claim that Wilber has failed to address certain issues that have been repeatedly brought up.

[7] In audio/video dialogs with other luminaries it is not unusual for Wilber to greet them using terms such as "buddy" and "pal." Wilber is often referred to as "Ken," even in academically-styled articles.

Table 1. Types of Critique.

	Example arguments:
Critiques of content	- Author is inconsistent, - Author is confusing, - Author makes unwarranted assumptions, - Author is inaccurate or invalid, - Alternative framework is proposed.
Critiques of method	- Author uses invalid methods of drawing conclusions, - The method used does not reflect the method the author claims to use - Alternative methods are proposed.
Critiques of style and intent	- Author's intention or purpose is harmful or unethical, - Author is purposefully misleading, hypocritical, or insincere, - Author's rhetorical style is harmful or unethical, - Author has serious character flaws leading to dubious style or intent.

The issues thus map approximately onto my orienting framework of looking at knowledge building in terms of mutual understanding (issues of comprehensibility and meaning), mutual agreement (issues of truth and validity), and mutual regard (issues of ethics and character).[8]

Critiques of Content

First, we will look at what Wilber's critics have to say about his AQAL theory of holons, quadrants, and perspectives.[9] We will also look at how Wilber responds to some of his critics, and vice versa. The arguments in the texts can become quite philosophically intricate, and the brief examples given below are not fair representations of them.[10] My purpose is to characterize some *properties* of the overall debate, rather than their substance and conclusions.

Types of Holons

Much of the disagreement is around sub-categories of holons as described by Wilber and by Kofman (2002). Wilber distinguishes "heaps" (such as a pile of sand) from "wholes," where wholes behave according to his Twenty Tenets. He also treats "social holons," which are collections or communities with particular properties, differently from individual holons. Kofman goes further to differentiate artifacts, leading to four fundamental types of things in the universe (individual, social, heaps, artifacts; Wilber then also uses these distinctions). One of the controversial issues is what types of things (holons) could be said to possess sentience (consciousness, subjectivity, or prehension; note that sentience is not mentioned in the Twenty Tenets).

---

[8] Note that issues of content concern *both* comprehensibility and validity, while issues of method are, in the corpus of text, concerned exclusively with valid methodologies.

[9] We will not deal with levels, lines, states, or stages here, as our focus is not to cover the content of integral theory, but to look at its espoused methods and at methods in practice.

[10] For example, Edwards in Through AQAL Eyes Part 1 pg. 3, describes holons as perspectival "points of reference" that are "simply not objective entities”—opening up the unanswered question of exactly what reality *is* made of.

The debates on holon types[11] are largely around the sufficiency of Wilber's definitions of them. Wilber's arguments, and those of others with alternate theories, have the form 1) <holon-type-T> is defined by <characteristics-C>, 2) if an entity is of <holon-type-T> then <implications-I> [i.e., the thing has certain properties, behaviors, relationships with other types of entities, etc.], and 3) specific <examples-E> are given. The arguments against these theories take the form of pointing out new (counter) examples of holons and showing that the critiqued theory makes a false prediction about holons of that type. Among the authors with alternative frameworks, some authors add new categories to better explain unusual examples (e.g., Edwards), and some reduce the number of categories (e.g., Smith). As the authors often admit, the new frameworks fix certain problems but create new ones in the process. Meyerhoff claims that Wilber reformulates his framework in light of the counterexamples offered by others, but does not credit the authors of these productive critiques.

In most cases the disagreements have the same epistemological source: claims are not so much categorically wrong as seen to be invalid under a particular definition or interpretation of a term (a <holon-type>, <characteristic> or <implication>) where the interpretations of the terms varies among authors. Some of the problem arises from *different* definitions of terms, and some from the fact that definitions use "graded" conceptual categories, as discussed later. Also, we can see instances where definitions are modified and claims refined in light of new types of examples not considered before. (This knowledge building dialectic is essentially the same as in Lakatos' *Proofs and Refutations*).

For example, Edwards claims the Kofman-Wilber definition of holons "implies that people are not members of a community or group or society when they fall below the average" (in intelligence or beauty, for example) ("Through AQAL Eyes" Part 1 pg. 36). Let us assume that Kofman would find Edward's critique disagreeable. Kofman might respond that 1) Edwards erred in *not understanding* his definitions and arguments, or 2) his theory is essentially correct but the *way it is described* could be clearer; or 3) his theory is incorrect and should be modified, and that Edward's found *a flaw* in it (and there are of course other possible response types). Edwards' point represents a typical and potentially very useful type of dialogical move that allows knowledge to evolve (though we don't know how it actually affected Kofman's or Wilber's ideas). This is exactly the type of interplay between examples, definitions, and claims that Lakatos describes in *Proofs and Refutations* (1976). Wilber's work has certainly gone through a number of evolutionary phases and refinements, which he claims have been assisted by the feedback of many dialogs.

---

[11] See (at IWN unless noted) Meyerhoff Chapter 1, Edwards "Through AQAL Eyes," Smith "The spectrum of holons," Goddard "Further thoughts on holons, heaps and artifacts", Jaron "My Holarchy and the Integration of Robert Pirsig and Ken Wilber" at http://www.moq.org/forum/GaryJaron/What'sWrongWithThisPicture.html.

Four? Quadrants

Another controversy mentioned by many of Wilber's critics has to do with the validity of the four-quadrant model and its descriptions. One issue is the confusion about whether every holon *has* all four quadrants (or can be seen *from* the perspective of each of the quadrants), or whether holons exist *in one* of the four quadrants. For example, Wilber's Four Quadrants diagrams (e.g., p. 62 in Wilber 2000c) show atoms as holons in the "upper right" (UR) (individual objects) quadrant and galaxies as holons in the "lower right" (LR) (plural/social objects) quadrant, but both are holons and can thus be seen from *either* the singular (upper) or plural (lower) perspectives. Wilber has clarified numerous times that the first interpretation is the more correct or fundamental one,[12] yet his descriptions, even up to the recent Kosmos II drafts (Wilber 2005a), also explain things in terms of the second interpretation.

For example, in Wilber (2005a, p. 6) Wilber says "we will take as examples actual occasions (or holons) *in* each of the four quadrants...The upper quadrants refer to individual or singular holons, and the lower quadrants refer to plural, social, or communal holons" (my emphasis). He uses similar statements in many of his texts. Elsewhere in the same text (p. 18) he says "Of course, there are not different holons in the four quadrants; the four quadrants are the four dimensions of every holon. But it is easier and simpler to say things like 'holons in the UR quadrant,' and so on, which is fine, as long as the tetra-nature of any holon is remembered."

Though I understand the usefulness in each interpretation of the holon-vs.-quadrant relationship, and, after a period of confusion, can now "remember" the caveat, I suggest that, given the possibilities of confusion and the controversy this often-left-implicit distinction has raised, in the end it may *not* be fine or simpler to use the same terms in two different ways.[13] I furthermore claim that the debate about whether holons can be said to exist "in" the upper left quadrant, for example, is due to transferring a property of the diagrammatic representation beyond its usefulness, and thus momentarily confusing the map with the territory. Edwards ("Through AQAL Eyes Part 4" and "Another Way of Putting it" on IWN) tries to remedy this problem with a significantly more complex set of diagrams. But the issue of general limitations to diagrams and other conceptual schema is not sufficiently addressed by Wilber's critics.

Primordial Perspectives and Integral Mathematics

Overall, Wilber's work attempts to provide an integrative model incorporating the primary value spheres of the modern life-world, i.e., mind (including art), matter (including science), culture (including ethics), and society (including economics, politics, etc.). His description of these value spheres is often given in terms of the pronouns "I," "it," "we," and "its/they," and his more recent work on "primordial perspectives" and "integral math" notation make heavy use of pronouns. For example, "1p(1p) x 1p(3-p) x 2p(3p)" represents "my first person knows, in a third person mode, your first person," which Wilber says "would simply mean, I am seeing you in an objective fashion" (from Wilber, 2005a, Appendix B).[14] This new work has generated a significant amount of critique and counter-theory on the IntegralWorld web site.

---

[12] For example, in "A Suggestion for Reading...", Wilber writes that "molecules are sentient beings ... [that]... can register objects in [their] world (it) has its own prehension (I), can resonate with other molecules (we);" and that "any object can be LOOKED AT from [the] four perspectives, but only sentient holons POSSESS four dimensions or can LOOK FROM four perspectives" and that "social holons do not possess four quadrants." Clear enough, but still confusing for the newcomer.

[13] For another corroborating opinion, see Mcfarlane (A Critical Look at Ken Wilber's Four Quadrant Model (2000) at integralscience.org/wilber.html) also claims that Wilber "is not consistent with his terminology and this leads to considerable confusion," and he gives several examples.

Several authors on the WSO site provide critiques and alternative models. Peter Collins, (in "Clarifying Perspectives, Part 4," WSO) claims that the ability to look at one quadrant from the perspective of another leads to 16, and then 64 distinct perspectives, which he diagrams at length. Mark Edwards ("Through AQAL Eyes part 7," at IWN) claims that Wilber's I-we-it-its framework does not make important differentiations, including differentiating the "you" from the "we" perspective, the "he/she" from the "it" perspective, or the "my" from the "me" perspective. (He claims that each of these constitutes valid perspectives, but in so doing it is not clear that he uses the same sense of the word perspective as Wilber.) He proposes a model that includes subjective, objecting, relative, and possessive pronoun perspectives. In it, first, second, and third person perspectives are extended from singular to plural, resulting in six perspectives. He continues to elaborate his model to produce 42 first-person perspectives, and over a hundred additional perspectives illustrated in about a dozen tables.

Andrew Smith ("The Pros and Cons of Pronouns," at IWN) critiques both Edwards and Wilber in claiming that there are no ontologically distinct second or third (or fourth...) person perspectives, that there are only different classes of first person perspectives. He also agrees with Edwards in differentiating actual perspectives (that a person has) from imagined (or notational) perspectives, which one person imagines or believes another person to have. He then uses his "single-scale hierarchical model" of holons to propose yet another system of I/you/we/it/them/thou perspectives.

Those providing alternates to Wilber's system offer complex, at times bordering on baroque, models that, though perhaps valid, are difficult to assimilate and use. It is not clear yet what practical purposes such systems, including Wilber's integral math, can be put to that would make it worth studying these frameworks to the point of fluency (or even getting a reasonable grasp of them). Models work by articulating key differentiating constructs and integrating them. There are an infinite variety of models possible for any phenomena or domain. The validity of a model depends critically on its usefulness and usability, and thus on its intended use. What problems does it allow us to solve? All of these models are less than clear on this point, making it difficult to compare their validity and usefulness.

In addition, I believe that the importance that these models place on pronouns creates an unnecessary degree of confusion and imprecision, because they lead us to transfer associations or map structures from informal use of language to more formal or ontologically basic arguments. To the extent that we enlist these inappropriate inferences, we engage in another form of confusing the map with the territory.

The Ubiquity of Indeterminacy

Wilber's critics fall prey to the same types of validity, coherence, and understandability problems that they point out in Wilber's works. As in any complex philosophical argument, within *all* of these integral theory articles we can pick out *many* instances where the definition of a term is unclear or where a term seems to be used in contradictory ways. The meaning and implication of statements hinge critically on which subtle shade of meaning is given to certain terms. Whether the arguments of Wilber's critics are *more* coherent, understandable, consistent, etc. and whether they have reworked their own theories in response to counterexamples and critiques *more* than Wilber has, is debatable. Validity-constituting properties such as coherence, understandability, and an open attitude to alternate perspectives and counter examples are important, but can also be illusive. Given the evidence, I would suggest that imbuing every one of one's claims with these qualities is both practically difficult, and, in the extreme, theoretically impossible. However, if one intends to engage in rational dialog in an effort to better understand the world, we *do* have to *attempt* to approach these qualities.

---

[14] Wilber notes that "a pronoun is not an actual person but a relative perspective that all actual persons can adopt" (Wilber 2005a, p. 137). He also introduces notation that distinguishes "we/us" from "our."

Wilber Responds in "Kind"

Before moving on, it will be noted that Wilber does acknowledge the *inevitable* difficulties in creating mutual understanding as well as his own part in creating *avoidable* ambiguity, for example:

> The distinction between an individual holon and its social holon...is not as easy to draw as it may first appear...because it is almost impossible to define what we mean by an individual in the first place...there are only holons, or dividuals. On the other hand..." and, later, "This is still somewhat arbitrary...because there are some social holons that seem to act as individual holons...an ant colony, for example (Wilber 2000a, p. 72).
>
> Also, although I tried as hard as I could to make chapter 14 in Integral Psychology...as clear as possible, I am now—given de Quincey's reading of that chapter—worried that I didn't succeed very well at all, so allow me to try to simplify and summarize (From "Do Critics Misrepresent My Position? A Test Case from a Recent Academic Journal, Part II," at WSC).
>
> One of my biggest problems is that, alas, I haven't the time to address all these issues adequately (from "On the mean memes in General, " at IWN).
>
> ...misrepresentation of my work is quite common, simply because there is so damn much of it, and many of my actual positions are buried in obscure endnotes; I have not helped much in this regard, a situation I am doing my best to rectify (as I will explain below) (in "Do Critics Misrepresent My Position?" at WSC).

Critiques of Method

I next move from disagreements about the content of integral theories to disagreements on the *methods* used to develop and validate integral theories. Several authors claim that the methods that Wilber uses to draw conclusions are flawed. For example, M.A. Kazlev[15] accuses Wilber of over-relativism, lacking predictive ability, unfalisifiable conclusions (a-la Popper), misunderstanding of original sources, and insufficient research. Along similar lines, Meyerhoff's book-length critique of Wilber's work offers the largest number of challenges to Wilber's method. Some examples (from the Introductory Chapter and Chapter 8, IWN) include:

---

[15] "Ken Wilber's 'integral' method and critique" at www.kheper.net/topics/Wilber/Wilbers_method.html.

> A cornerstone of postmodern understanding is that an overarching integration of knowledge of the kind Wilber attempts is not possible and that a radical plurality of perspectives is a fact of contemporary life. A type of relativism prevails which Wilber believes he has transcended, but which my analysis shows he has not....we cannot hope to have a large-scale model of the kind Wilber attempts.... Hiding behind Wilber's belief that all partial truths must fit together is the debatable assumption that all the partial truths correspond to one true world....Yet the philosopher Nelson Goodman has made a strong argument that there are contradictory truths which cannot be assimilated into one coherent picture of the world.
>
> The assumption is that if a great and influential thinker says something, what they say is supposed to carry authority. It's a curious pre-Enlightenment way of validating statements by reference to authority.
>
> Anyone who reads a lot of academic writing develops straw man radar. The reader senses when the arguments attributed to the author's opponents are being formulated weakly. The problem is, as Rorty says, that 'such neat little dialectical strategies only work against lightly-sketched fictional characters.'
>
> [Wilber] presupposes background points of agreement or orienting generalizations. In each field of knowledge Wilber culls this already-agreed-upon background knowledge and constructs his integral synthesis...assumptions that debating scholars assume to be true as they debate the relevant issues in their fields...I show the extensive and contentious debates surrounding the supposedly already-agreed-upon knowledge that Wilber uses to construct his integral framework.[16]
>
> [there is] a problematic conflation of intellectual and spiritual insight...While Wilber would probably agree that the advanced mystical stages do require leaving rational thought behind, he tries to create in the intellectual sphere a great Whole that preserves the parts; a kind of intellectual Oneness to match the supreme mystical insight into Oneness....one great theory of everything [is] in the wrong direction...Thinking must be seen as a path to spiritual insight through the critical, skeptical and deconstructive questioning that is prominent today in a postmodern world.

It should be noted that Wilber has not yet responded in writing to Meyerhoff's critiques, so one can only guess how he would respond. This is in part because some of Myerhoff's material has only recently been posted. Wilber may of course choose not to respond for any number of reasons. Based on my reading of Wilber and his responses to other texts, I can at least say with some confidence that Wilber would claim that Meyerhoff has misrepresented, simplified, ignored, or does not understand important elements of his written works. In (attempted) fairness to Wilber, I will say that Wilber does not ignore these issues in his writing. In (attempted) fairness to Meyerhoff, it would seem that these methodological issues weigh much more heavily on one who proposes a "theory of everything" than on one who is merely critiquing another's theory.

---

[16] Meyerhoff continues: "...while the participants in a given academic debate do presuppose background knowledge which you could cull and call "simple, but sturdy" knowledge, as Wilber wishes to do, it's only because the participants in that debate don't happen to be debating the validity of that background knowledge....It doesn't mean they are not debatable...Is this a piece of "simple, but sturdy" knowledge? Not according to contemporary debates in epistemology...One person's generalized orientation is someone else's point of contention."

Integration vs. Differentiation, and Kettle-Calling

The main thrust of Wilber's theories is to look for integrating generalizations in diverse fields of knowledge, while Meyerhoff's is to point out the (sometimes historical, sometimes inevitable) differences, disagreements, and incommensurability among such theories. However, Wilber also discusses theoretical disagreements and differentiating multiple perspectives, and Meyerhoff also makes his own overarching and integrating claims. It must be said, however, that while Meyerhoff offers some strong arguments against the possibility of a "theory of everything," his own text can be interpreted to include instances of most of the methodological problems he mentions above. These include: overarching models (but not as "large scale" as Wilber's), grounding an argument in authoritative thinkers (e.g., Rorty, White), including value-laden or moral elements in what is presented as a fact-based logical argument, using language to theorize about ineffable or spiritual truths and paradoxes, and attributing simplistic beliefs to others (Wilber) that seem to me to be so obviously invalid that I presume no serious intellectual would agree to hold them (i.e., he is using a form of straw-man argument).

More Indeterminacy

Therefore, notwithstanding the many particular instances Meyerhoff points out where Wilber seems to be inconsistent or where he disagrees with Wilber's conclusions, in a broader sense what he describes very clearly are the real difficulties in: (a) creating conceptual models, (b) coherently communicating a complex matrix of ideas, (c) making truth claims in non-scientific domains, and (d) the inevitable convolution of fact and value (truth claims and ethical claims). That his own text demonstrates many of these fundamental problems is only more proof of the inevitability of these problems (i.e., evidence of the impact of epistemological indeterminacy).

Meyerhoff emphasizes that the human drive to generalize can lead to significant problems, while Wilber emphasizes the utility (if not validity) of this drive. Rather than favor either side of this issue, one can say that most texts and dialogs can do more to avoid the pitfalls of overgeneralization while still accumulating its benefits. Though the fundamental philosophical issues cannot be "solved," some of the problematic aspects of these themes can be ameliorated. This would benefit all. Therefore, though the collective quest for meaning and understanding is fraught with indeterminacy, it is not futile, and it can be engaged with more or less skill.

As a final example of critique of method, Edwards' "The Integral Cycle of Knowledge" (2000, at IWN) emphasizes the postmodern perspective on methodology and validity, which addresses the dialogical and interpretive nature of meaning-making. Unlike the critiques of Kazlev and Meyerhoff, Edwards focuses on Wilber's stated *model* of method, rather than critiquing Wilber's methodology itself. He claims that Wilber's "three strands" epistemological model for knowledge validation is missing a critical fourth strand: an interpretive strand. However, Edwards notes that elsewhere in Wilber's writing he clearly acknowledges the interpretive element of validation. Wilber proposes a three step methodology with the interpretive phase folded into it, while Edwards suggests a fours-step model with the interpretive step clearly separated. Is one method wrong or invalid while the other is valid? Clearly, it is not as simple as this. I will revisit the question of validity criterion further below.

Critiques of Style and Intent

Next, I turn to critiques of Wilber's work that focus on his character or on normative or ethical issues. Below, I give some samples of derogative or inflammatory snippets from various authors. Note that these are selected to characterize this aspect of the overall debates, and are not meant to be fair representations of the average style of any author, or of the average character of the overall dialogs.

Conspiracy Theories and Empires Without Umpires

Some critics criticize those who adopt Wilber's theories, and complain that Wilber and his "inner circle" is "co-opting the whole Integral Agenda," and flag the "danger inherent in relying upon any one person to define and determine Integralism" (Peckinpaugh "Shut-Ins" on IWN) (also see "The Cult of Ken Wilber" by Michel Bauwens, on the IWN). As to whether such complaints are sour grapes or clarion calls, I can not say. There are clearly grains of truth to both perspectives, but I choose not to engage in the more political aspect of the debates. More to the point here are questions about the ethical validity of knowledge building practices. Edwards protests:

> Ken has started a new initiative [on the Integral Naked site] called “The Critics Circle,” and the set up is that a student asks Ken a question that is the student’s understanding of some other person’s criticism [of Ken] and Ken responds. The student courageously tried to summarize 50 pages of reasonably tight argument in a few words...I completely understand that Ken has no time for reading the great amount of critical material on Integral theory that exists on the web and on [the Integral World] site...But...asking others to summarize huge amounts of material and then responding to their potted versions is just not the way to run a “critics circle.”("Some Thoughts on the State of Things," on IWN).

To this Wilber responds by noting that the new Integral Institute website will soon publish a slew of more rigorously debated articles by a wide range of associates of the Institute. From the perspective of the health and evolution of "integral theory" worldwide, it is probably undesirable to have most of the theoretical influence coming from a single person, and to have that person maintaining a firm grip upon their theoretical orientation. However, from the perspective of Wilber (and "his" organization) it makes perfect sense, both logically and psychologically, to focus energies in ways that deepen, expand, and disseminate his theoretical intuitions, while conserving energy and protecting the considerable existing investments from dilution or decay. Very, *very*, few powerful leaders in any area, even in spiritually or ethically oriented projects, have the type of humility and openness to diverse opinions that their detractors claim they should have. However, democratic or decentralized organized groups *can* establish norms and awarenesses that counteract these problems.

Nastiness and Mea Culpa

Wilber has been criticized for his argumentative, polemical and abrasive manner. Many of the statements referred to are in Part 3 and the extensive Endnotes of Wilber's *Sex Ecology Spirituality*. Wilber addressed this issue in the following way:

> [SES] is in some ways an angry book. Anger, or perhaps anguish, it's hard to say which. After three years...of being exposed to [the contemporary style of academic debate which included]..some of the most toxic and venomous writing I have ever seen...in anger and anguish, I wrote SES, and the tone of the book indelibly reflects that." Wilber then notes that comments about SES ranged from calling it "refreshing critique and liberating humor" to "unmannered, rude, and offensive" and adds "No doubt, both sides were right (p. xxi in Wilber 2000; and see also "On Critics, Integral Institute, My Recent Writing" at WSC).

Rather than finding that polemical, abrasive, or dismissive statements detract from an argument, apparently many find such rhetorical features entertaining and convincing. There is no dearth of such statements by others about Wilber and his work. Stabs at Wilber range from Kazlev's relatively innocuous "I can understand where [Wilber] is coming from, and sympathize with it, but I find his position simplistic" to Heron's more colorful "I despair of Wilberians…. People ask me from time to time what I make of Wilber's work. And I have to say, 'Not a lot'" ("A Way out for Wilberians," at IWN).

Character Analysis

Wilber's reflective explanation of his stylistic coarseness, quoted above, may suffice for some, but for others a deeper explanation seems to lie in waiting. Several have engaged in ad-hoc psychological analysis of Wilber, his character, and his unconscious motives. Meyerhoff, in his extensively researched analysis of Wilber's work, traces Wilber's personal history and links it to a hypothesis that a "...core issue of duality or separation and the need to integrate ...[and the] split between science and spirit and the need to prove spirit to science...[and an] aversion to loss and a resulting desire for integration" underlies Wilber's intellectual process (pp. 201, 206). He suggests that since "the great danger for the grandiose is deflation by the intrusion of the real" that the above noted unconscious forces accounting for an "insecurity [that] drives him beyond repetitiveness and caricature to the sarcasm and snideness for which he has been criticized" (pp. 211, 213).

In another psychological analysis, de Quincey asks:

> Why does [Wilber] seem driven to master the domain of reason, to construct an impenetrable intellectual edifice...the impression [is] that this immense rational fortress has been erected to withstand any possible intrusion of ambiguity, paradox, or mystery, and is designed to shut out the messiness of intense feeling. Everything, it seems, must fit (The Promise of Integralism, p. 5, at IWN).

Though Meyerhoff has done his research and is freer to speculate with an objective air, in de Quincey's case one can note a polemical intensity of tone that belies a strong emotional motivation. That he does not reflect upon or disclose his own emotional state makes him subject to his own critique.

Where does one draw the line between ad hominem attacks that, though perhaps rhetorically persuasive, have no bearing on the issue at hand, and psychological analysis that adds insight and meaning to the study of someone's' work? Is it *ever* valid to analyze the personality or personal history of one's rhetorical opponent (especially if one has little intimate knowledge of them)? The answer to these questions are, of course, very context specific but such rhetorical moves are, at a minimum, risky, as one can see with Wilber's tit-for-tat rebuttal to Heron's "I despair of Wilberians…. " article (quoted above):

> Heron tells us...that he has a "self-imposed ordinance," which is "not to spend too much time" in arguments that "typically involve heavyweights slugging it out in absolutist theoretical arenas..." And then Heron delivers...a torrent of propositions landed on each other to build up scores of points...absolutist positions...in a relentless stream... All the while Mr. Heron assures us that [he deplores] the type of "theoretical gun-slinging" which supposedly characterizes all of my writing.

Strong Straw Men

A common critique in any academic area is that one's ideas were simplified or misrepresented. The *ethical* implications come in to the extent that it is stated or implied that the other party *intentionally* misrepresented them, and there is often a flavor of such condemnation in the debates. In his book Meyerhoff (2006) states:

> Anyone who reads a lot of academic writing develops straw man radar. The reader senses when the arguments attributed to the author’s opponents are being formulated weakly. With Wilber, weak formulations are the norm. What he typically does in SES is: refer to some general group of authors such as “the ecophilosophers” or “the multiculturalists,” caricature some part of their views he doesn’t like, and then repeatedly “prove” that they are wrong about the point he’s fixed upon. While reading these pages one wonders who these people are and do they actually believe such simplistic things? (IWN).

Meyerhoff has a similar comment about his *own* critic (in "Reply to Jan Brouwer," who wrote a critique of his book): "Most of my arguments that Brouwer does discuss are reduced to simplifications, similar to the way Wilber treats *his* opponents' arguments." Though Meyerhoff's analysis of Wilber is extensive, and in this way far from a simplification, Wilber might say, and Brouwer does argue, that Meyerhoff selectively chooses Wilber's quotes to make a point, and thus is also guilty of simplification. One could argue that it is no more feasible that Brouwer's 24-page review of Meyerhoff's book will do it justice than that Meyerhoff's single book can do justice to Wilber's twenty books. In all cases, the authors have points to make that they no doubt have some attachment to, select statements as data to support their opinions, and do the best that they can (we will assume) not to misrepresent the other and to critique with integrity. And in all cases, the outcome is less than completely objective, as complete objectivity in authors is not possible. The processes of critique and response are, of course, critical for a community as a whole to weed out over- and under-statements. The point made later in the paper in terms of

"The Believing Game" is that this back-and forth can be more efficient and less like flailing to the extent that authors make efforts to assume each other's perspectives.

The straw-man complaint is also launched by Daryl Paulson in Wilber's defense: "...what is so problematic about Ferrer's [critique of Wilber is that] it lacks all subtlety, it lacks any granularity—it is based on a series of crude distortions of Wilber's complex and inclusive views, reducing them to a series of superficial straw-man arguments that Ferrer then attacks with considerable hostility" (critiquing Jorge Ferrer's critique of Wilber, at WSC).

Wilber's articles "Do critics misrepresent my position" (WSC) and "A suggestion for reading the criticisms of my work" (IWN) likewise complain that his critics misread and misrepresent him, for example:

> My recommendation ... is that [critics] try to separate two very different tasks: (1) presenting their own good ideas in themselves, and (2) criticizing mine. Because [so many of the critics on the Integral World web site] combine their possible truths with a mis-statement about mine, their overall sentences and presentations are FALSE... And this is truly unfortunate, because ....their OWN views are often true and important...Based on that crucial misreading, a series of further misreading follow...[amounting to]...a staggering distortion of my work "A Suggestion for Reading the Criticisms of My Work" (IWN).

In a like-minded rebuttal, de Quincey, in his 13-page rejoinder to Wilber's 23-page response to de Quincey's 30-page critique of Wilber's 303-page book *Integral Psychology* writes: “I was immediately struck by the degree to which Wilber manifested many of the critical failings he had accused me of—not least of which were the ‘misrepresentations,’ ‘distortions,’ out-of-context quotes, ad hominems, and plain factual inaccuracies in his ‘test case’ response.”

This is beginning to sound like a soap opera, for which I can take much credit since I am picking out a few quotes from many pages of more substance.[17] However, one does wonder whether, if so much of this writing is based on distortions or misrepresentations of another's work, whether the whole enterprise is seriously inefficient. But there is more...

Read My Mind

The concern by many authors that others are launching critiques based on simplifications or misrepresentations is certainly a valid concern, and illustrates one of the problems with open-ended internet dialogs without peer review. But in a related posting, Wilber takes a stronger but much more tenuous stance, saying: "...if somebody wishes to criticize [my version of integral theory] specifically, then they must first state it accurately...usually the only way to really understand a theory and criticize it cogently is to do so verbally, in person or by phone, with its originator." Clearly there are some serious problems with this view—so serious and obvious that I wonder whether Wilber thought through the implications of his two-page response before sending it off. Though this may be the way that mutual understanding is created in a student-guru relationship, it is not the criterion normally used in academic or philosophical dialog.

---

[17] I will note that over the approximately 10 years of articles on the Integral World web site, that the tone between Wilber and his critics/colleagues seems to have steadily deteriorated (on both sides). The early articles of several authors are, if anything, overly respectful, and even claim a collegial understanding of some of Wilber's foibles, such as the polemical style of Wilber's SES book (e.g., Visser's "The Seven Faces of Wilber").

That people offer simplified examples of each other's works in order to make a point is unavoidable. Debates may have a bit more integrity if a one makes a clear distinction between what an author says (and/or *seems* to imply) and what an author must actually believe, as the latter is a far more speculative claim. For example, Meyerhoff's critique that in Wilber's writing "a type of relativism prevails which Wilber believes he has transcended..." is doubtful. Wilber himself crosses the mind-reading boundary at times, for example: "incredibly, [William] James overlooks the fact that the symbol per se...is itself...immediately experienced or apprehended by the eye of the flesh" (Wilber 2001, p. 63).

That there are inherent difficulties in offering a "correct" interpretation of another's work is clear. In fact, Berge notes that Wilber himself says that "there is no single correct interpretation because no holon has only one context" (from "Who decides what Wilber means" at IWN).

Back to Basics

Before closing this section, I will show several quotes from Wilber's texts that remind us of the underlying intention behind his methodological pluralism—an attitude which has ethical as well as epistemological import:

> I have one major rule: everybody is right. More specifically, everybody - including me - has some important pieces of the truth, and all of those pieces need to be honored, cherished, and included in a more gracious, spacious, and compassionate embrace (from the Introduction to the Collected Works of Ken Wilber, Vol. VIII, p. 49).
>
> ...in other words, all of my books are lies. They are simply maps of a territory, shadows of a reality, gray symbols dragging their belies across the dead page (from Visser, 2003, Forward).
>
> ...This means that the chief activity of integral cognition is not looking at all of the available theories—whether premodern, modern, or postmodern—and then asking, 'Which one of those is the most accurate or acceptable?,' but rather consists in asking, 'How can all of those be right?' (Wilber, 2005a).

Though Wilber may not be open to multiple perspectives on what he *himself* believes, the underlying intention of his integral theory (and all integral theories) contains a type of intellectual generosity. Sometimes, but not always, integral theorists translate this theoretical generosity into a generosity of practice through dialog (spoken and textual). Although in the end (and in the beginning) our fragile human nature places limits on our openness to conflicting beliefs and challenges to our own beliefs, I propose that as communities we can develop tools and practices that nudge us in the direction of a generous spirit.

Discussion of Integral Theory Textual Dialogs

The following general points are summarized from my discussion of the texts I have quoted:

- There is ample evidence that authors have **different meanings** or intentions for the same terms, and even that the same author uses a given term in different ways.

- Some of these differences come from different background **assumptions**, which are **not** always **clearly stated**.
- Many of the disagreements or ambiguities result from the fact that the theories use **discrete conceptual categories** (e.g., types of holons, UL-UR-LL-LR quadrants) and make claims about the objects within each category, but that examples can usually be found that fall between categories that invalidate the theory's claims. Both Wilber's theories and the alternative theories of others are shown to have this problem. Authors blame the problem on the inaccurate, inconsistent, or confusing statements of others, but there is little attention paid to the unavoidable and inherent indeterminacy of all conceptualizing schemes.
- Most conceptual **categories are "graded"** in that things can be assigned along a continuum within the category rather than into the discrete conceptual "boxes" suggested by the concept. Models that make claims, usually of the form "X follows from Y being true," are only true for examples that fall centrally in the categories used.
- Each model is but one attempt to provide meaning to a complex phenomenal space, with countless other alternatives. It is difficult to compare models or evaluate their validity or usefulness when one does not have a clear indication of their **intended use** and what questions they are designed to answer.
- The complex and sometimes **reciprocal relationships between the concepts** of a theory can pose problems in determining a prerequisite-based sequence of ideas explaining the theory. Some claims must be summarized in simplistic, and thus partially inaccurate, ways before other concepts are introduced.
- Theories often run into problems when diagrams are created as **visual representations** of conceptual models. We sometimes transfer properties of the diagrammatic representation itself to the theory, stretching the diagram beyond its usefulness, and leading to an interpretation that confuses the map with the territory.
- One can also create problems by **transferring properties of linguistic systems** to conceptual models, for example in the use of pronouns ("I," "it," "we," etc.) to anchor aspects of integral theory.
- One finds almost universal evidence of a, perhaps unavoidable, form of **hypocrisy**, in which those who pronounce ethical or normative judgments seem guilty of the same infractions that they perceive in others.

Issues in mutual understanding arise from such sources as differing background assumptions, and fuzzy or graded conceptual constructs. Issues in mutual agreement come from two sources. One is disagreement on the *facts or conclusions* of another author's argument. The other is disagreement on the *methods* one has used or on what methods in general lead to valid claims.

Critiques aimed at another's method come in the following forms: over simplification, over generalization, straw man arguments, over-reliance on authorities, relativism, idealism (inappropriate synthesis or postulation of universals), lack of empirical evidence, lack of falsifiabilty, un-provable prior assumptions, internal inconsistency, incoherence, misrepresentation of an author's claims or intentions, and insufficient dialog or participation in a hermeneutic process. However, I illustrate that in almost every case, an author who critiques another's method is guilty of the identical infraction. It may seem that some degree of hypocrisy is unavoidable. Epistemological indeterminacy affects what members of a knowledge building community can reasonable expect of each other, and thus how critiques are dispatched.

One can note that there is nothing even remotely approaching a consensus on the validity criteria that should be used for integrally informed theories, and there is very little dialog about validity criteria. Later I will argue that no single validity or legitimacy criterion is appropriate, but that a triangulation of multiple methods and validity criteria will usually be necessary.

I illustrated a number of critiques of style and intent. In the nastiest cases there were veiled charges that another *intentionally* misrepresented one's argument, which is a more serious and less provable claim than the unintentional misrepresentation discussed above. Charges of misrepresentation usually take the straw-man form that another has portrayed one's argument too simplistically. Wilber noted that one can be on thin ice when they propose to interpret the ideas of another, and he noted how dialog and engagement were important elements of mutual understanding, which in turn is essential to productive critique. He went too far, however, in suggesting that those who could not have a personal or extensive dialog with him were unfit to critique his theories.

I noted several authors who propose psychological character analyses of Wilber. As in the paragraph above on method, I show how authors who sharply criticize the abrasiveness or polemics of other authors are often found guilty of same crimes. However, unlike critiques of method, we cannot say that such dialog attributes are unavoidable in knowledge building. The adage that "those who live by the sword die by the sword" comes to mind in a couple of exchanges where ad hominem implications fly like daggers (or sticky wet noodles) in the wild, wild west of internet cyberspace.

Quotes were selected from this slice of the community of integral theorists to illustrate issues in the areas of mutual understanding, mutual agreement, and mutual regard. Some readers may be thinking "but those critiques against Wilber are correct, the problem is not about indeterminacy!" That would miss the point. My concern here is not with whether claims or counter claims are valid, but in how individuals, and especially communities, deal with diverse perspectives and claims when there is no clear practical empirical or scientific method to settle what is true, and whether integral theory points us to productive approaches. All of the issues raised and illustrated in these quotes point to general issues faced by all knowledge building communities. A similar (though perhaps less colorful) analysis could be done with any knowledge building community, though each would of course have unique characteristics. Also, there is no implication that these issues are easily eradicated or dealt with—they are ubiquitous and entrenched in the way that knowledge building is practiced. In the remainder of this article, I will explore the philosophical, psychological, and sociological elements of these problematic issues.

Indeterminacy in Mutual Understanding, Mutual Agreement, and Mutual Regard

In the previous section, I showed evidence from integral theory community texts of a number of problematic patterns related to epistemological indeterminacy that plague knowledge building communities. I also hinted that, though these issues were complex and to some extent unavoidable, there are things that communities can do to ameliorate many of the problems.

Before I recommend specific solutions, I need to explore the nature of the problems, their causes and effects, by looking at some current theories of mind, group, and knowledge.[18]

Validity Claims and the Entanglement of Understanding, Agreement, and Regard

I will introduce an orienting framework based loosely on Habermas' theories of Communicative Action (Habermas, 1981) and Discourse Ethics (Habermas, 1999). Habermas' work shows that most statements imply four types of "validity claims."[19] The validity claims are claims that we explicitly or implicitly make in communicating some belief. In any statement, such as "your uncle is a communist sympathizer," the most obvious claim concerns the explicit claim of the statement. This is a claim about **truth** of facticity. But, according to Habermas' theory, three other types of claims are implied. The second validity claim is that we are **understood** (i.e., comprehensible). The third is that what we are saying is ethically or normatively **acceptable** (or appropriate). The fourth is that we are being **truthful** (i.e., sincere). Thus when we say something, we are implying four types of things, and are implicitly expected to be prepared to reply to questions or challenges in all four areas. Examples of these four types of challenges are: "that is incorrect, I disagree;" "could you please say/explain that again, I didn't understand;" "that is wrong" (in the ethical/moral sense or in the normative sense that “we just don't do/say that around here"); and "I don't think you even believe that yourself; you are misleading me."[20]

There are several important points of departure starting from Habermas' theory. First, it highlights the importance of mutual understanding as a prerequisite to one's attempts to dialog about what is true (or good, just, or beautiful). Second, it serves as an introduction to Habermas' claim that the true and the right can only be determined through dialog. Third, Habermas shows how *ethical* considerations are at work in all instances and at all levels of communication (the details of his arguments are beyond our scope here). Both the truthfulness and acceptability criteria have ethical implications. Habermas' "Theory of Discourse Ethics" goes further to show how ethical values such as freedom, equality, sincerity, empathy, inclusivity, reciprocity, and integrity are always already implied in acts of communication.

To organize my discussion, I use a framework different than but related to Habermas' four validity claims. I will speak of **mutual understanding, mutual agreement, and mutual regard**. Habermas' work shows how these three areas are mutually interdependent and exquisitely entangled. Clearly, mutual agreement, the collective search for the true (or the good, beautiful, just, or right) requires a certain level of understanding. One can also see that, conversely, mutual understanding is not possible without some underlying level of agreement, some shared assumptions or meanings. That mutual *regard* is completely entangled in both mutual agreement and mutual understanding is less generally acknowledged.

---

[18] Much of what I present below is examined in more detail in "Epistemological indeterminacy and collaborative knowledge building: Dilemmas in mutual understanding, mutual agreement, and mutual regard" (Murray, 2006a).

[19] Habermas also calls these communicative, constative, regulative, and representative validity claims. In some of his works, Habermas omits the compressibility/communicative claim in describing this scheme.

[20] This is an extreme simplification of Habermas' theory but sufficient to ground my rhetorical framework.

Habermas believes that, particularly in the post-modern context, iterative dialog is necessary to determining the true and the right. For example, the scientific process is a dialog among peers in which data and ideas are considered. The democratic process involves dialog and debate to determine what to do for the public good. What one thinks is true or right is always open to challenge by hearing new information or coming to understand another's position. However, in order for dialog to productively move us in the direction of the truth (a more valid, even if never complete, truth) or the morally best action, dialog must have certain properties. The most productive dialogs have several properties: (a) all important or relevant points are heard, (b) dissenting opinion is not suppressed, (c) people speak honestly and without hidden agendas, and (d) participants care about each other and the agreed-upon goals, values, and procedures of the group. Of course, such is not always the case, and in real settings these characteristics can be at odds with each other (as when a suppressed minority has to violate an agreed upon procedure to be heard). Also, the pragmatics of such principles can be arduous (e.g., how does one determine which views are relevant?).

The ethical implications here are clear. Attempts at finding mutual understanding and mutual agreement are thwarted and outcomes are systematically distorted to the extent or degree that mutual regard is lacking. Habermas notes that another important property of ideal or productive discourse is that it is reflective. Participants must be alert to how the process itself is going, and whether the process and outcomes reflect their values and goals.

An ideal knowledge building discourse is one that (a) creates mutual understanding, (b) identifies mutual agreement, and (c) embodies mutual regard, and thus (d) moves efficiently and effectively toward valid knowledge useful to all participants. Creating one is difficult for many reasons. I focus on epistemological indeterminacy as a core problematic issue in knowledge building. This focal theme links to related sources of difficulty for knowledge building, including participants' diverse needs and opinions, power dynamics, and cognitive or developmental limitations to what can be discussed in a group.

Having explained the focus on mutual understanding, agreement, and regard, and having argued briefly for their importance and their dependence upon each other, I will explore how epistemological indeterminacy affects each of these three areas.

Indeterminacy in Understanding and Communication

Problems in mutual understanding were quite evident in my analysis of integral theory texts. Authors explicitly showed different interpretations of concepts, and authors faulted other authors for allegedly misinterpreting their own ideas. Understanding will always remain problematic, but what if anything can be done to mitigate the clear and frustrating inefficiencies of the misunderstandings observed in knowledge building communities? First, I explore the nature of the problem. The question of to what extent people can understand each other and communicate meaning though speech or text has been explored extensively in philosophy under the subject of hermeneutics. Mutual understanding has social and intersubjective aspects, and it also has cognitive aspects having to do with how precise or stable any concept can be, even within the mind of an individual. I will touch on all of these topics below, and will begin by examining indeterminacy in ideas at three levels: concepts, statements, and models. Models are composed of statements (relationship propositions), and statements are composed of concepts.[21]

Concepts

Concepts are categories or groupings of objects, events, or other kinds of things (nouns, verbs, properties, and modifiers all point to conceptual categories, e.g., tree, religion, diet, swimming, symmetry, holon, manifest destiny). They are abstract references to a set of things that have something (or some things) in common. Concepts, like all abstractions, never fully describe real instances because real instances have a practically infinite number of properties (or things one could say about them or ways to describe them) while abstractions, by their nature, involve a limited number of properties. For example, the concept "ball" refers only to the ball-like aspects of that thing I am pointing to, and leaves out everything else, including what it is made of and its color.[22] When one describes an individual object using a concept, one is taking a perspective on it. This perspective involves a particular purpose, as when one calls something a "ball" rather than "trash" or "a projectile," which it may also be.

Seminal cognitive research by Rosh and Mervis discovered that human concepts do not usually behave in the manner of "classical" concepts, as they were widely assumed to by philosophers and other thinkers since ancient times (Rosh & Mervis, 1975; Mervis & Rosh, 1981; also noted in Wittgenstein, 1953). A classically structured or defined concept is one with a set of necessary and sufficient conditions, in which it is possible to determine in a clear-cut way whether something is or is not an example of the concept. Most conceptual categories are not classically structured but allow for grey areas, peripheral membership, and other types of indeterminacy. Such categories are called **"graded" conceptual categories**. It turns out that most abstract categories are graded concepts. For example, a person is not either narcissistic or not—they may be "sort of narcissistic," or fall anywhere along a graded continuum. Consider the concept "chair." Bean-bags, toy chairs, benches, broken chairs, are all sort of chairs, and sort of not. There is no classical definition of chair that will cover all of the objects that might normally be thought of as chairs. Thus, when one says something about chairs or narcissism (or any graded concept), there is always some level of indeterminacy as to exactly what one is referring to.

A compounding issue is that definitions of concepts are based on other concepts. So even if one *could* create an air-tight definition at one level, one is thwarted at the next level down. We could imagine having a solid definition of holons in terms of concepts such as "part interchangeability" and "prehension" but these properties are indeterminate concepts. It’s a house of cards all the way down. Also, the network-like and hierarchical structure of meaning relationships poses many problems in written and spoken communication, which is linearly and sequentially structured (for more about this see the MetaLinks project, Murray 2003a, 2005). It is often impossible to design a prerequisite-based sequence of ideas that build logically up to a concept. In most non-scientific matters (politics, philosophy, culture, etc.), the massive interdependence among concept meanings means that attempts to identify or define fundamental constructs or building blocks are rather arbitrary. What is most fundamental and what is secondary or derivative is a matter of perspective.

---

[21] This differentiation of ideas into three types is not meant to be rigorous and is done to organize the points of the discussion.

[22] For simplicity my examples are often about physical things, but the analysis is valid for more abstract concepts as well.

A modernist (or structuralist) approach to explaining an idea tries to identify "the best" or most logical prerequisite sequence of ideas. In contrast, a post-modern (deconstructivist) view might reject any attempt to logically build up meaning, and produce a meandering monologue that tries to include all the relevant ideas in an almost arbitrary sequence, assuming that the reader would create their own personal "gist" of the meaning by the end of the text, all the while refusing to nail down or try to define the meaning of any term or idea. But of course, one can do better than either of these caricatured extremes, in what one might call a post-metaphysical, integral, or second tier approach.

Statements

Next, I shift the discussion from the meaning indeterminacy of concepts to the meaning indeterminacy of statements (simple claims or propositions), which are composed of concepts. Consider statements such as "X causes Y" or "X has relation R to Y". Given that most concepts are graded or "fuzzy," then any such statement really implies "***to the extent that*** the object is an X, then …." For example, if one says "holons are sentient" then (unless this is a tautological or definitional statement) one is saying that to the extent that something can be characterized as a holon (has the defining properties of a holon), to *that extent* it can be characterized as sentient. George Lakoff discusses such **graded propositions** that "...contain linear scales [that] define the degree to which a given property holds of an individual...defined by a graded category..." (Lakoff, 1999, p. 288).

Indeterminacy at the level of propositions (statements or claims) is centrally about truth (or validity), and I explore truth and validity in the next section. The *meaning* of a proposition can be problematic and indeterminate, but that indeterminacy comes predominantly from the meaning of its constituent concepts (or from the meaning of the model of which the proposition is a part). Concepts do not have a truth value, so their indeterminacy is restricted to the topic of "mutual understanding" and not "mutual agreement" (e.g., "tree" is neither true nor false, only propositions about trees are). Epistemological issues at the level of models span both types of problems, meaning and truth, more equally. Models are systems of propositions and often propose that "the world works this way," yet it is also common knowledge that models are approximations and abstractions.

Models

Models (including theories, frameworks, ideologies, and other complex idea-systems) are the main foci of debate and division in most communities of policy and action (political, religious, etc.) and in most knowledge building communities (in science, economics, education, etc.). Models and other abstractions are important, even essential, tools in knowledge building. They focus attention on specific elements in a complex field of information and articulate perceived patterns. They provide shared conceptual scaffolding and common reference points for inquiry and dialog. This text explores the indeterminacies and limitations of models, but not, to be clear, as an argument against using models, but rather as an exploration of how these indeterminacies and limitations can be dealt with.

Models, like all generalizations and abstractions, are simplifications that incorporate important features and ignore others. Models are meant to be analogous to objects/processes/events/things/etc., and an analogy can only be taken so far before it is no longer useful (e.g., electrical current in wires is *like* flowing water in pipes, but only up to a point; Newton's law of gravity is correct up to a point, then we use Einstein's law, which in turn may be shown to have limits). A model focuses on a particular set of features that are important with respect to a *particular task or purpose*. Therefore there can be *multiple* models for a given situation or thing, as different perspectives or purposes will highlight and ignore different features (see Bara et al., 2001).

Models, then, are perceived patterns in data or ideas, and as such constitute perspectives. The pattern perceived depends on the angle taken, the observer's location, the filter viewed through, the tools and methods of observation—to speak metaphorically. Some perceived patterns are unproblematic because they seem more objectively real (we might all acknowledge that that is a "tree" over there) and some are unproblematic because the group of people we are speaking with shares some common perceptions of the world. But from the phenomena of Rorschach Tests, in which individuals see images in ink blots, to the phenomena of conspiracy theories, in which groups find questionable causal patterns inside sparse data, we know that the human mind is adept at pattern detection—"to a flaw."[23] Cognitive psychologists have demonstrated numerous ways that the mind "sees" regularities by filling in for missing (or nonexistent) information at many levels of cognitive processing. The point is not that what one perceives, e.g., a tree, is "just" one perspective, or that the tree does not "really exist." The important point is that in addition to the patterns that we easily recognize there may be alternatives perceivable by others.

As George Lakoff explains, we often live happily with *conflicting* conceptual models. "Conceptual systems are pluralistic not monolithic. Typically abstract concepts are defined by multiple conceptual metaphors, which are often inconsistent with each other" (Lakoff & Johnson, 1999, p. 71). For example, "in philosophy, metaphorical pluralism [multiple metaphors for the same concept] is the norm. Our most important abstract philosophical concepts, including time, causation, morality, and the mind, are all conceptualized by multiple metaphors, sometimes as many as two dozen. What each philosophical theory typically does is to chose one of those metaphors as 'right,' as the true literal meaning of the concept" (Ibid., p. 78).

It will be useful to classify models as predictive, explanatory, or organizational. *Predictive* models, as the term implies, allow us to say something about the future, either definitively or probabilistically. *Explanatory* models help us understand *causal* (or at least strong correlational) relationships between things. *Organizational* models neither predict nor explain, but simply help us organize or visualize a set of relationships. Integral theories are, by and large, explanatory and organizational models that are not so much testable representations of reality as they are cognitive tools that allow us to achieve certain ends.

In his book Alchemies of the Mind social scientist Jon Elster "views the ideal of law-like explanation [in] the social sciences as implausible and fragile" (Elster, 1999, pg. 1). Psychology, sociology, ethnography, political science, etc. have had little luck in predicting phenomena, he explains. But they have been very useful in providing *explanations* of phenomena. For example, if we know that a person is an alcoholic, and we find out that her parents were alcoholics, then

---

[23] I do not even mention indeterminacies in perception, as illustrated by optical illusions etc.; nor the indeterminacies in the accuracy of memory being documented by psychologists (Roediger & McDermott 1995); nor the work on "bounded rationality" by Kahneman & Tversky (Kahneman et al. 1982), each of which cast its own hue of uncertainty upon truth claims.

(assuming we know a bit more about the personal history) we may think that we have identified a causal explanation. However, knowing that a person is a tea-totaler can also be "explained" by the fact that both of their parents were alcoholics. Explanatory models have this characteristic, in that they tell us something about the way the world works, but not enough to predict what will happen.

Negotiated and Intersubjective Meaning

Over the last century, philosophers and theorists of mind have developed several widely accepted notations about truth and meaning (see, for example, Wachterhuaser's *Hermeneutics and Truth*). First, that all ideas involve interpretation. This is the "hermeneutical axiom" that thought is conditioned by the experiences and context of the thinker. Related to this is the notion that meaning of an idea (a concept, statement, or model) is not determinate but is "negotiated" over time among interlocutors. The meaning of a word exists not so much "in our heads" (and certainly not in some dictionary) as in the intersubjective or hermeneutic space between or among the individuals.

As long as speakers share a common-enough meaning for a concept, it remains unproblematic and rather invisible. But meaning becomes problematized when divergent interpretations meet in dialog. A group may have developed a particular meaning for the concept "consciousness" while another group may have developed an altogether different meaning, where meaning includes what is implicated and associated with consciousness, as well as what one would categorize as having consciousness. Ignoring the divergence in how foundational concepts are interpreted, though common, often results in a significant amount of unproductive communicative flailing.

Importantly, meaning-making involves a dialectic movement between instances (examples or experiences) and generalities (ideas, thoughts, etc.). In *Proofs and Refutations: The Logic of Mathematical Discovery*, Imre Lakatos (1976) illustrates that even in domains as precise as mathematics the meaning of concepts and models has some indeterminacy. Lakatos chronicles the evolving understanding of Euler's formula "V-E+F=2" for polyhedra (the relationship between the numbers of vertices, edges, and faces in three-dimensional objects with flat sides such as cubes, soccer balls, pyramids, etc.). A rather surprising result is that the definitions of the terms as basic as "polyhedra" and "edge" are not unproblematic. As new examples and counterexamples were considered, mathematicians found that either the law or the definitions needed to be refined as their theorems were improved.[24] In all domains, not only the laws/principles/truths evolve, but so do the meanings of even the key foundational concepts (see also Kuhn, 1970). Robust or usable explanations of fundamental concepts must include ample reference to examples.

Hermeneutics and Expertise

Jean Grondin says: "...it is only if one inquires into the underlying motivation of what is being said that one can hope to grasp its truth. In other words, what is the urgency that speaks through an utterance which alone makes its truth claim understandable? This is the prime question of hermeneutics. If one ignores this question...one risks missing the true meaning of what is being said" (as quoted by Hargens 2001 from Grondin's 1995 *Sources of Hermeneutics*). This raises the question of what motivates a critique and when critique is and is not productive.

---

[24] This example is similar to the way that Wilber has had to refine his definition of holons and holon types once it was noticed that human artifacts posed special problems in the system of definitions.

The traditional academic process of trying to understand the work of any great thinker (and practically all of Wilber's critics solidly put him on the pedestal of great thinkers before chipping away at his theories or personality) involves an attitude of suspension of disbelief/critique at least in initial stages (though this is more true of *deceased* great thinkers). Thus, with great theorists like Piaget, Goethe, William James, Aurobindo, and Wittgenstein, it is *assumed* they had some deep understanding and that the job of the reader (or academic) is to go through their never-completely-clear, sometimes contradictory statements and ideas (which are acknowledged to have evolved over time through their texts) and construct a sufficiently accurate interpretation that allows us to understand their substantial ideas, insights, and intuitions. Within philosophy it would seem that there are as many texts that argue over what so-and-so *meant* (a process of exegesis) as there are texts that disagree with so-and-so's claims and offer alternative theories (a process of critique).

Because the meaning of a statement (or paragraph, or full text) extends beyond the statement itself, one must always look beyond a piece of text to interpret its full meaning. The "triangulation" of different textual passages and interpretations to produce a stable meaning is characteristic of the hermeneutic process of trying to understand another (imperfect) human being. As the sea mariner needs several bearings to pinpoint a point of land ("triangulation"), we come to understand the fuller, deeper, or broader meaning and implications of something through considering it from different "angles" (perspectives), a process that often requires dialog and dialectic. Another thing one can say is that efforts to improve the understandability of a text or idea are good investments. Understandability and interpretation are improved by including numerous bi-directional links among texts, ideas, definitions, examples, etc.

How one balances efforts to understand (exegesis) with efforts to critique in a process of inquiry is of course a complex open question. What one can say is that the more one can demonstrate that they have delved deeply into and struggled with another's work, the more validity their critique will have. I will return to this theme later in a discussion of negative capability.

The Unconscious

Freud's "discovery" of the unconscious aspects of mind has had a profound impact on how we understand basic human capacities as such as thinking, belief, and action. Epistemological sophistication requires some understanding of the unconscious. Modern attempts to examine the validity of knowledge or beliefs must embrace the problems introduced by non-conscious mental processes. Without adhering to any particular model of mind (there are of course many) we can note that contemporary theories of mind point to a spectrum of awareness to non-awareness (non-consciousness). This spectrum is illustrated with the following levels of consciousness:

- Ideas or mental processes that we are aware of and understand enough to describe (e.g., why I think it is going to rain);
- Ideas or mental processes that we are aware of having but can't satisfactorily describe in words (e.g., my strange but undeniable fear of clowns);
- What we are not aware of but could easily become aware of (e.g., the current sensation in the left foot, or the name of our neighbor's dog);

- That which we could become aware of but only with considerable effort, including difficult to access memories, or awareness that would take considerable mental concentration or training, or an in -depth therapeutic process;
- Mental processes which we could never become aware of (e.g., how we process language or how the retina's signals are converted into images).

The existence of unconscious processes and beliefs creates indeterminacy or grey scales in knowing "what I believe," "what I understand," etc. There are things that "I might know" and that "I believe that I know," as odd as such statements sound. The acknowledged existence of unconscious motives also muddies the water in ethical considerations having to do with free will, choice, responsibility, and accountability.

Messy, But it Works (Until it Doesn't)

With so many sources for conceptual and terminological indeterminacy in every thought and utterance, one might wonder how we ever "know" anything or get anything done. One might wonder whether there is any benefit to examining something so ubiquitous and persistent. In practice, the meaning of concepts and statements usually remains unproblematic and unexamined until our meanings or beliefs clash with another's (or ideas clash within one's own mind). We could not talk or do anything without unconsciously (pre-consciously) taking a large number of assumptions for granted. As society becomes increasingly pluralistic and cosmopolitan, meanings clash more often (or pass in conversation like ships in the night, never meeting) and questions of how we deal with this type of indeterminacy become more important.

In knowledge building, we pay particular attention to meaning. The explicit goal of improving knowledge naturally causes us to question and refine the meanings of terms and the validity of models. New terms and models are introduced consciously, and the creation and stabilization of meaning is more palpable.

Indeterminacy in Agreement, Truth, and Methodology

If we assume that those involved in a knowledge building dialog understand each other sufficiently, the next level of concern is how participants determine what they agree upon, what is true, or what is valid. In trying to understand another person, it is expected that we allow for hypothetical or imaginary realities and possibilities. If someone says "the field is foggy today" in a context where one cannot see this fog, one enters into an imaginative mode where one envisions the fogginess being described. In the understanding process we entertain ideas regardless of whether we think they are true. Whether we agree that the field is indeed foggy is a different matter.

In this section, I shift the focus from indeterminacies in understanding to indeterminacies in truth or in finding agreement. The discussion of "mutual agreement" is not about how to create agreement (for example conflict resolution and formal decision making procedures are outside the scope) but rather about exploring that nature of agreement, and, more specifically, how it is affected by indeterminacy. Agreement is not necessary, or even desirable, in many situations, but having a sophisticated understanding about agreement and validity is important to most collaborative situations.

Truth and Validity

There are a variety of theories of what truth is and how it is determined (for example, see Kikham's Theories of Truth, 1992, for a discussion of how philosophers use varied and even inconsistent meanings of truth). The most common senses of truth are: (a) truth means correspondence with objective reality; (b) truth means coherence with other things that we know (or believe to be true); (c) truth is what everyone, or most people, or experts consense to being true; or (d) truth is based on practical utility (whether a statement satisfactorily explains or predicts and helps us achieve our goals). Though various disciplines may formally use one of these senses of truth more than the others, in practice all individuals and all knowledge building communities (somewhat unreflectively) use a combination of these truth senses to create knowledge and mutual understanding. One's overall sense of whether something is true relies on a combination of all of these elements, and if any one of them is missing, one's certainty is challenged.

Lakoff (1999) argues convincingly that the meaning of "truth" (like all abstract concepts) comes not from a single conceptual core, and not from a transcendental ideal, but from interweaving, multiple, sometimes contradicting metaphors tied to and constrained by embodied experiences. Such "metaphorical pluralism" is the case at both individual and group levels, and is the case even for formal domains such as mathematics and logic. In rigorously or deeply evaluating the truth of a claim, we can not take the meaning or nature of truth for granted. Some philosophers (e.g., see Rorty, 1999) go as far as to say that truth does not exist in any meaningful way, or that it is futile to search for truth. I join with Habermas and others who say that truth's indeterminacy, rather than negating truth, necessitates a more careful awareness of truth-related methods and criteria.

As alluded to in the discussion of Habermas' theory, the concept of "validity" includes the many meanings of truth, usefulness, correctness, believability, appropriateness, etc. and allows us to address questions of truth, meaning, justice, and knowledge building at a general level that includes these many notions. So, I will often speak of the "validity" of a statement or model rather than its truth.

Sources of Validity

Theorists have discovered several things about how validity is imbued or judged. First, validity has a procedural component, such that the method that we use to arrive at a claim is important in determining its validity. Habermas (1981) shows that, though we may not be able to claim that a statement or belief is unequivocally valid, we can develop procedures that steer us toward more valid knowledge and away from invalid knowledge. Second, validity has a communal (intersubjective or socially negotiated) component. Habermas states that society has shifted "the standard of...objectivity...from the private certainty of an experiencing subject to the public practice of justification within a ... community" (Habermas, 2003, p. 249). Given the modern understanding of the fallibilities of human reasoning and communication, we can not guarantee that an individual can make errorless unbiased observations, consider every type of relevant data, and imagine every possible counter-argument that another might make. Thus, knowledge building is unavoidably a collective effort where multiple trials, perspectives, and areas of expertise accumulate to arrive at any general consensus about what is true. Third, the procedural and communal aspects of validity point to the dialectic aspects of knowledge building. New ideas create new questions and cause us to look for data in new places. New claims incite doubt that brings renewed attention to the validity of a claim's justifications. Each new idea asks to be integrated with prior and future ideas, some of which seem incompatible, until another synthesis is found, in an endless process.

Wilber (2001) explains these procedural and communal aspects in terms of three strands of knowledge validation: 1) the instrumental injunction to observe using a particular method, 2) the illuminative apprehension of experiencing the raw data after following the prescribed method, and 3) the communal confirmation gained when (if) many individuals agree that when you follow the injunction of step #1 you do observe those data in step #2. Those who provide arguments to support or refute a claim have to show that their method allows them to "look at the same thing," so-to-speak.

A fourth component of validity is that it is perspectival. As noted above, each concept, statement, or model represents a perspective on reality. When multiple perspectives point toward the same conclusion, we have more confidence in the validity of an idea. Lakoff & Johnson (1999, p. 79) say: "what needs to be avoided...are assumptions that predetermine the results of the inquiry [or] circumscribe what is to count as data...A common method for achieving this...is to seek converging evidence using the broadest available range of differing methodologies."

The perspectival aspects of validity are at the center of Wilber's integral approach. Wilber's analysis of a broad range of knowledge constructing methodologies has lead him to an elegant model that proposes eight types of "primordial" perspectives and an accompanying eight truth-finding methodologies, including: empiricism, systems theory, phenomenology, structuralism, hermeneutics, and cultural anthropology (Wilber 2005). His philosophy of "methodological pluralism" is to acknowledge the importance of all of these ways of finding truth, within a framework that clarifies the limits of each.

The procedural, communal, dialectic, and perspectival aspects of validity add considerable indeterminacy to determining the validity of claims. And so does the fact that there are many types of validity and many meanings/methods for determining the truth of a claim. This means that in some situations it is not enough to dialog about the final "truth" of a claim, and that a meta-dialog is necessary that focuses on how truth or validity are to be determined for a particular group or situation.

Truth and Meaning

Integral theories are models or frameworks with explanatory and/or organizational functions (they tend to have limited power as predictive models). As such, their purpose is more about meaning making than truth finding. They are best compared or validated based on properties such as parsimony, scope, internal coherence, consistency with other theories, and/or usefulness in providing distinctions and syntheses that add meaning—and not based on how their results correspond with objective reality. (This is more true for the philosophical and systems theory aspects of integral theory than of its psychological elements.)

Integral theories tend to be theories about ideas rather than theories about objective data. In Eye to Eye, Wilber (2001) compares "mental-phenomenological inquiry" into subjective and mental phenomena with "empiric-analytic" inquiry into objective or physical phenomena. He applies his analysis to knowledge building endeavors focused on subjective phenomena, for example, determining the meaning of Shakespeare's Hamlet, discovering the meaning of Egyptian hieroglyphics, and Freud's theory of the unconscious. He discusses how inquiry in such mental-phenomenological realms follows the same methods (strands) of knowledge validation as empiric-analytic inquiry, namely the injunction to observe using a specific method and the collective dialogic/hermeneutic processes of assigning meaning to data and validity to conclusions. However, there is one important distinction that Wilber does not make in his discussion that is relevant to the validity of integral theories (and many other theories).

The examples Wilber gives are about inquiry into meanings held by "others" — Shakespeare, Egyptians, or "people in general" (for Freud's theory). These inquiries aim to find some specific answer about something outside ourselves (what Shakespeare or the Egyptians meant, how the mind works, etc.), but integral theory is a tool for us to use to generate meaning or answers. Integral theories propose to create meaning for readers/users to help them answer their own questions. They are general-purpose "cognitive tools" whose scope goes beyond meaning-generation of a particular subject area. They do not claim that "some part of the world is this way" but that "it is useful to look at the world through this lens."

Since I concluded above that meaning-generation, rather than truth-finding, is at the heart of integral theory knowledge building, I will expand a bit on the meaning of the word "meaning," giving three senses of the word, each inclusive of or more general than the prior one. The first sense refers to shared meaning or the meaning of a statement. The second sense is related to how an idea (concept, statement, model, etc.) can have "more meaning" than another idea (to some person or group). Here "meaning" refers to salience, usefulness, or importance, and is related to the quality or quantity of relationships established with other (salient or important) ideas. Ideas also have more meaning if they point to the origins/causes or purposes/ends of things, or involve higher order relationships (Gentner & Stevens, 1983; Johnson-Laird, 1983). In this second sense, an integral or explanatory model is more meaningful if it explains a broader scope of phenomena and ideas. A final sense of "meaning" is as in "the meaning of life" or when an idea has "deep meaning" to us. This implies that the idea is related to things that we value highly or it is related to important life issues. This type of meaning is usually linked to one's sense of identity.

By emphasizing meaning-generation over correspondence to truth in integral theory knowledge building, we are emphasizing the utility aspects of its validity. For many explanatory and organizational models, it is more important to ask if they are useful than if they are true in a strict sense. Falsifiability does not apply as a rigorous test of theory validity as it does in the sciences (Popper, 1935). But this does not have to lead to extreme relativism or the rejection of rigor. Usefulness and accuracy are tightly linked. A theory that does not explain important or common patterns of data has limited usefulness. Myerhoff and others criticize Wilber for his syntheses of whole fields of knowledge, saying that such syntheses are invalid or even impossible because they gloss over important areas of controversy within disciplines. Pointing out counter-evidence and counter-arguments to a specific theory or claim, as Meyerhoff does in his critique of Wilber, is invaluable in a community's attempts to validate a theory. But in going deeper to question the usefulness of the very methodology and enterprise that Wilber engages in, Meyerhoff's critique goes too far. One can profitably ask whether Wilber's synthesis of some field is as good as any other synthesis, or is sufficiently accurate and useful to its intended purpose. But to reject any and all attempts to synthesize, organize, or explain large swaths of complex and conflicting ideas would cripple knowledge building practice.

Indeterminacy and Mutual Regard

There are deep reciprocal relationships between regard and my other topics of understanding and agreement. As one comes to understand another's perspective, one can hardly help but develop empathy for them. Conversely, an attitude of care or respect supports, and at times is necessary for, making an effort to understand another's perspective. A similar reciprocal relationship exists between agreement and regard. Discovering or building agreement fosters solidarity. Conversely, an attitude of care or respect is important as participants forge new agreements or make the effort to discover where they agree.

Unsurprisingly then, mutual regard is highly desired in knowledge building activities and knowledge building communities. The quality and quantity of collective knowledge generated can depend greatly on the level of mutual regard. And so can the strength and integrity of the community itself. But, of course, mutual regard is often difficult to create to the desired level, for reasons too numerous and too complex to even summarize here. My focus is on the interplay between epistemological indeterminacy and ethics (mutual regard). The goal is not to moralize or be ethically prescriptive but to tease apart the important issues to enable awareness, support a group's explicit dialog about these issues, and to inform the design of knowledge building tools and practices.

What is 'ethics'? In a world that can seem rife with materialism, objectivism, and instrumentalism, where the simplest directives of ethical behavior have become lost in a fog of abstraction, complexity, manipulation, and moral relativism, sincere consideration of ethical topics is essential. Yet the topic of ethics is practically taboo in academia, school, politics, science, and "polite company." Therefore, it is worth taking a moment to ground the topic of ethics in some very basic intuitions, to clarify its meaning for the purposes of this discussion. At its core, ethics and morality are about caring and justice, as understood intuitively.[25] Ethics can be about much more than that, as shown in countless philosophical discourses, but without a motivating core of regard, respect, compassion, love, or whatever flavor the caring takes, ethics is empty—both as something one does and as something one theorizes about. Another core element of ethics is that ethical judgment and action take place against a backdrop of self-interest and self-preserving drives, making ethics fundamentally about how one balances one's needs with the needs of others.

Integral Theory and Ethics

Integral theory's core approach of incorporating multiple perspectives and methodological pluralism has numerous implications for ethics. According to Habermas (1999), reciprocal perspective taking is at the core of moral thinking and action. One can differentiate two aspects of being multi-perspectival, one cognitive and the other affective. Cultivating multiple perspectives clearly involves cognitive skills in managing information, complexity, uncertainty, ambiguity, etc. It also involves affective skills because opening to and processing multiple perspectives can be difficult and frustrating. Multiple perspectives can be impersonal (or rational), as when one tries to consider two interpretations of quantum mechanics, and can be personal (or psychosocial), as when one tries to put oneself in the shoes of another. Tolerance for uncertainty and ambiguity includes a kind of emotional intelligence (Goleman, 1995; Matthews et al. 2002). Psychosocial perspective taking often requires putting ourselves in the emotional as well as cognitive shoes or another. It can involve trying on another set of values or imagining an alien historical context.

---

[25] One of the main debates in the philosophy of ethics is about whether ethics is about the more cognitive and abstract capacities involved in justice, or about the more emotional capacities involved in caring and empathy. I side with Vetlesen, who shows how both elements are needed equally (Vetlesen 1994).

One's response to a claim is often affected by one's emotional attitudes toward specific people or groups. To associate an idea, especially a new or novel one, with an identifiable author or group contributes significantly to its meaning (or meaningfulness), and we are naturally drawn to build such associations. There is sometimes an emotional (even visceral) resistance to opening up to, not just an idea, but his/her/their idea. In addition, there are challenges to loosening the grip on my idea.

The issues that come up in being multi-perspectival are very much the same as those that arise from epistemological indeterminacy. Indeterminacy is one result of considering multiple perspectives; or we could say that the inherent indeterminacy of knowledge is due to its inherent multiplicity, which is in turn due in part to how one's knowledge is constructed through interactions with many people.

Indeterminacy, socialization, and vulnerability. G.H. Mead’s theory that human identity is constructed largely through social interactions is captured in this quote from Habermas:

> …morality is a safety device compensating for a vulnerability built into the sociocultural form of life [in which people are] individuated only through socialization...[This] profound vulnerability calls for some guarantee of mutual consideration. This considerateness has a twofold objective of defending the integrity of the individual and of preserving the vital fabric of ties of mutual recognition through which individuals *reciprocally* stabilize their fragile identities...To these two complimentary aspects correspond the principles of justice and solidarity respectively [that is, respect for the dignity of each individual and protection of the web of social relationships]. (Habermas, 1999, p. 199).

Epistemological indeterminacy is in part about the inability to be certain or definitive. Certainty is an important human need. A degree of certainty is necessary for action, and lack of certainty often results in cognitive dissonance and unpleasant feeling states. In many contexts, as certainty decreases, as the conceptual ground upon which one's ideas stand becomes more precarious, there is a psychological reaction or impulse to gather in and maintain safety, to narrow concern to near-term issues at the expense of long terms ones, or to focus on individual needs at the expense of group needs (or in-group needs at the expense of broader values). Epistemological indeterminacy, and our imperfect attempts to compensate for it, opens up new horizons of awkwardness and vulnerability for the speaker (or author).

Epistemological indeterminacy increases the exposure to the possibility of being criticized, and increases the opportunities available to the malicious, careless, or indifferent. It expands the potential of the critic to claim that another is naïve, ignorant, wrong, hypocritical, ambiguous, vague, or indecisive. Indeterminacy also increases the potential to give dishonestly positive accounts and manipulative praise. For instance, a person with sufficient motive and skill can recast the story of any life's work (Gandhi's, Hitler's, Elvis', Aristotle's, the Romans', the Mafia's, yours, or mine) as sad and pathetic, a triumphant achievement, narcissistic and contemptible, well intentioned and rational, or ignorant and shallow. The sharp sword of indifferent, insincere, or malicious criticism has no natural bounds, and its power to harm is strengthened by the vulnerabilities of epistemological indeterminacy.

In the overview of integral theory textual dialogs, I noted several things. First, in referring to another author's work it is almost impossible not to simplify (one can never supply the full context), over-generalize, and make selective use of their points to support one's own. Second, in abstract or philosophical discussion it can be practically impossible to avoid some degree of hypocrisy. It was found that in almost every case of one author critiquing another's style, method, or intentions, the author making the criticism was at some point guilty of the same infraction he was leveling against another. Without sanctioning all forms of hypocrisy, overgeneralization, misunderstanding, etc., we can note how epistemological indeterminacy (a) makes it virtually impossible to eliminate such things completely, (b) leaves the door to critique of such things constantly open, and (c) creates new opportunities for deliberate abuse.

Knowledge building progresses through a dialectic of convergent and divergent movements. Knowledge is refined (convergently) as invalid information is rejected and corroboratory information is discovered, leading to an increase in certainty. Alternatively, when knowledge is expanded (divergently) through the discovery of unexplained information or alternative perspectives, certainty is reduced. Uncertainty and indeterminacy are inevitable in inquiry. Therefore, the most truthful statements will often portray indeterminacy, for example: "I should know that but I don't…," "I could be mistaken…," "I was wrong, I changed my mind," "it is too complex for me to understand," and "I find both possibilities equally compelling." Such statements are less likely to be expressed in low-trust situations.

The level of trust within a community affects the degree to which indeterminacy can be reflected upon and negotiated (as opposed to ignored, denied, or defended). The level of trust within a group and the level of courage in the individual compensate for vulnerability. In a high-trust environment, vulnerability is not an odious presence to be repelled but an inevitable reality to be dealt with carefully. Trust, solidarity, and regard support a group's tolerance for uncertainty, ambiguity, and vulnerability. A group's level of trust and its tolerance for uncertainty must be considered in adopting approaches to epistemological indeterminacy.

Power and Dialog

Up to this point, I have been discussing elements of ethics related to individual choice. Responsibility for the ways that people do or don't respect and regard each other lies in part with individual decisions, but also lies in larger systemic patterns that become internalized in individuals and operate unnoticed in our interactions. Thus, a treatment of ethics would be incomplete without mentioning the dynamics of power and privilege. As Hans Kögler (1992) puts it, "every interpretation is grounded in some particular context and...every such context may be permeated by hitherto-unrecognized power structures" (p. 252). When tacit and socially conditioned ways of thinking involve privilege, preference, power, or social control, then our attempt to discover durable truths and just methods is distorted. Power dynamics affect knowledge building communities and practices as significantly as any other type of group or practice.

The naïve approach to power dynamics is to try to eliminate them, usually along with eliminating social hierarchies. But, as articulated in philosophy by Michel Foucault (1998) and in transformative psycho-sociology by Arnold Mindell (1995, 2002), power and rank differentials are inherent to all human interactions. (Importantly, Mindell includes the force of one's personality, context, or message along with socially endowed rank in his analysis of power). Power, hierarchy, authority, and leadership are not negative in and of themselves. In fact, these elements are inevitable in groups and are often essential to effective and just outcomes. Of concern is when these elements are hidden from awareness, unavailable to dialog, or have not been legitimated by the group in some way. The issue is complex because there is no objective standpoint from which to determine exactly what constitutes privilege, injustice, bias, etc., as the current debate over whether men are (also) “oppressed” contests to (and similarly with the debate as to whether Wilber and his close associates have appropriated the field of integral theory).

These difficulties notwithstanding, since power can distort and bias knowledge building in unproductive ways, it cannot be ignored. Power dynamics lead to systematic distortions in communication and knowledge, and can exploit vulnerabilities and erode trust, all of which affect knowledge building. There do exist productive approaches to power dynamics, such as increasing the awareness of power within a community and making explicit use of existing sources of power to further the values and goals of a community (see Mindell, 2002; Rosenberg, 1999). In this article, I do not explore specific methods of dialog and group process, but simply point to dialog, reflection, and other awareness-increasing methods as being critical components in dealing productively with power dynamics in knowledge building.

Cognitive Empathy and Self-Distanciation

In *The Power of Dialog: Critical Hermeneutics After Gadamer and Foucault*, Hans Kögler (1992) suggests that only through a certain perspective taking attitude can one hope to see beyond or behind tacit social power-structures and thus challenge them. He builds upon Habermas' position to emphasize the importance of opening up to the perspective of the other as a way to gain critical insight into one's own biases. Kögler says that such "self-distantiation" (gaining a conceptual distance on oneself) is only possible through the unsettling experience of encountering the, at first incomprehensible, world-views of another. Like Habermas, he emphasizes actual dialog, which is to say that trying to imagine the reasonable or possible perspectives of others from an arm-chair is no substitute for the real experience of encounter. The ensuing tension can rupture the limiting horizons of our pre-understanding. Gaining this more objective perspective and "defamiliarizing" from habitual beliefs requires taking a strong ethical stance to honor the integrity of the other's inner world equally with one's own, and to be authentically curious about that other perspective. As Kögler puts it, one can treat others as "autonomous (co)subjects with a right to their own conceptualizations and self understanding" (p. 203). In other words, when in the uncomfortable position of being confronted with an idea that challenges one's beliefs, rather than immediately critique it, one must sincerely wonder how it could be that the other thinks/believes/feels that way?

In *Perception, Empathy, and Judgment: An inquiry into the preconditions of moral performance*, philosopher Arne Vetlsen (1994) argues that "moral perception rests on the faculty of empathy [which is] indispensable in disclosing the addressee to the subject" (p. 7). He argues that the emotional capacity for empathy is co-equal and necessary along side the cognitive capacities implied by Kant's imperative to understand and treat others as "ends in themselves." Empathy, as a faculty of perception, is a type of attentiveness or receptiveness, and is likened to seeing or listening. Moral perception "gives judgment its object [and is what allows one] to identify a satiation as carrying moral significance in the first place" (p. 4).

Practical Implications and Skills for Dealing with Epistemological Indeterminacy

In describing some theoretical perspectives that lead to a deeper understanding of the causes and effects of epistemological indeterminacy, I separated the concerns into mutual understanding, mutual agreement, and mutual regard. I also indicated that understanding, agreement, and regard were interdependently woven together. Next, we will move on to some tentative suggestions for how the problems and opportunities of epistemological indeterminacy can be approached in practice. As we do so, we will allow understanding, agreement, and regard to fold back into one another in a reintegration that has benefited from the differentiated discussions above.

Because this article constitutes an exploratory inquiry (i.e., an attempt to point out a new area of study by applying an interdisciplinary set of theories to a new subject area) I cannot possibly outline a systematic set of skills, knowledge, and methods to fully address the issues raised. Also, my status as a peripheral participant in the integral theory knowledge building community limits both my understanding of the community and my ability to make specific recommendations. Rather, I will discuss a few important practical points and make a few concrete suggestions applicable to any knowledge building community, as a beginning point for further inquiry.

Several interrelated or interdependent skills will be mentioned. I discuss a number of theories related to dialectical thinking and negative capability, the core skills in processing multiple perspectives. Then I discuss skills that counterbalance these skills, moving from Yin-like to Yang-like factors and skills. These are followed by specific knowledge building approaches that I call indeterminacy analysis and differential analysis. That discussion is followed by an investigation of validity criteria usable for integrally-informed theories. I close the section with a discussion of several other practical recommendations related to dialog and information structure.

Negative Capability, Dialectical Thinking, and "Believing"

I turn next to the skill of "negative capability," a term coined by the poet John Keats, who explained it thus: "that is when man is capable of being in uncertainties, Mysteries, doubts—without any irritable reaching after fact & reason." As Keats knew, being comfortable with ambiguity, paradox, mixed feelings, and conflicting thoughts is useful well beyond the realm of poetry.

Several theorists describe the skills of negative capability in a developmental context. Early theories bearing on the subject include Kohlberg's (1978) articulation of pre- and post-conventional modes of moral thinking, and Perry's (1970) articulation of stages of epistemological sophistication (both of which also involve identity formation).[26] Michael Basseches (1984, 2005) uses the term "dialectical thinking," describing it as a "post-formal" form of thinking developmentally beyond formal thinking and relativistic thinking, where one can not only acknowledge a plurality of viewpoints, but work creatively and critically within them. Dialectical thinking emphasizes processes, relationship, wholeness, and dialectic, over product, reductionist analysis, and fixed/certain results.

---

[26] There are many relevant perspectives on these cognitive skills, including: theories of metacognition and self-regulated learning (Winne 2001, Schoenfeld 1985), King and Kitchener's theory of "reflective judgment" (1992, 1994), Schommer-Atkins theory of "epistemological belief systems" (2002), Csikszentmihalyi's theory of Flow (1990), as well as a wealth of research looking at critical thinking skills and creative thinking skills.

Quantum physicist David Bohm developed a form of group dialog (now called "Bohm Dialog; see Bohm, 1996, and related work by DeMare, 1991) in which participants dialog for several hours without an agenda or leader and with the intention to suspend and reflect upon reactive interpretation, judgment, and certainty. One of the goals is to develop "proprioception of thought"—an ongoing and uncritical but [sharp/refined] awareness of the contents of one's own mind that would lead to an awareness of one's biases.

Otto Scharmer (see Senge, Scharmer, Jaworski, & Flowers, 2004) is among a cadre of modern thinkers who analyzes negative capability in terms of "letting go," "letting be," and "letting come." This three-part model provides one way of separating the multiple sub-skills involved in negative capability (though the sub-skills are so tightly interwoven that any attempt to differentiate them is approximate). "Letting go" refers to one's ability to suspend judgment, "bracket" one's assumptions and biases, and temporarily release emotional or ego attachments. "Letting be" points to equanimity—an ability to dwell in the stillness of not knowing for an extended period. "Letting come" refers to the creative (or spiritual) insights that can arise in the process. Scharmer notes that the deeper and more sustained is one's letting go and letting be, the more powerful are the fruits of letting come and implementing the resulting insights and convictions.

Peter Elbow (2005), known for his work in developing new approaches to teaching the skills of writing, critiques the current pedagogical emphasis on "critical" and "skeptical" thinking skills. He claims that, though these skills are important, the academe and the culture at large overemphasize and misuse them. Critical thinking is predominantly directed at others, and too infrequently used to question one's own ideas and world-view. The "disciplined practice of doubting all views" (p. 3) that is held out as a standard for rational thought, rather being a tool for greater understanding and expansion of knowledge, more often becomes a shield for protecting one's own world-view. Why not also have a disciplined practice of trying on all views? He calls this practice the "Believing Game."

Echoing Kögler's theory above, Elbow claims that one gains the right to critique another after first "dwelling with" and "dwelling in" another's words. He notes that "when readers fail to read critically it is not usually that they believe everything, it is that they are unengaged in any way; not dwelling in or critiquing anything" (p. 3). The goal then is to develop both critical thinking and "believing" skills. As Elbow says, one should avoid two extremes: dogmatism, which is to be unskilled at doubting, and skepticism, which is to be unskilled at believing. Because educators (at least at the post-secondary level) already emphasize critical skills, he focuses on developing Believing—the engagement of curiosity and the temporary suspension of disbelief.

In the context of knowledge building, what this implies is that when confronted with an idea that seems "wrong" (and this wrongness will almost always have both a cognitive logical and emotional intuitive aspect to it) the suggested approach is to maintain a curiosity: In what sense is it also true? How might one have come to that conclusion? What perspectives, experiences, and assumptions might lead one to that idea? And also, *Why* might one want to come to that conclusion? What explicit or implicit goals might it be leading up to? What ancillary claims does it entail that are connected with legitimate needs of the other?

In methodological pluralism it is not that "everybody is right;" it is that "anybody could be right," everybody is partially right from their perspective, and, not to forget, "I might be wrong." The skills mentioned above encourage us to see the "golden mean" or "middle path"—the "both/and" inside an "either/or." Integral theory says that an evolving understanding should transcend and include previous valid ideas, not transcend and reject or ignore them simply because they don't fit neatly together. In the section on ethics, I noted that there are affective as well as cognitive skills involved. Suspending judgment, releasing one's own ideas, and taking on the perspective of the other involve emotional intelligence as well as intellectual intelligence. One could say that "negativity capability" has both cognitive and affective components. The affective component is the perceptual-emotional capacity for empathy described by Vetlsen (1994) and the cognitive component is described by Basseches' (1984, 2005) dialectical thinking. This demonstrates another sense in which mutual understanding, agreement, and regard are intertwined.

Skill, Balance, and Group-Perspective

The application of theory to practice requires a judicious weighing and balancing of factors—a skillfulness in understanding the idiosyncratic constraints of each context. For example, it has been noted that epistemological indeterminacy is in some ways inevitable and to some extent preventable. The practical wisdom of epistemological sophistication helps us differentiate the avoidable from the unavoidable (or, more accurately, to distinguish gradations along this continuum) and determine the best attitudes and methods for each situation. This is one important meta-skill. Negative capability and dialectical thinking are two other generic skills (or meta-skills). Below I mention a few additional skills or meta-skills relevant to dealing with epistemological indeterminacy. Groups may benefit from their participants systematically reflecting upon, developing, and practicing these skills.

Group Perspective Taking and Trust

I have mentioned that modern approaches to truth and validity emphasize process over product. A process-based approach to validity focuses on asking questions such as "Were any rules of logic or inference broken?" "Are all the relevant data and perspectives accounted for?" and "Was any bias introduced along the way?" Since addressing these questions requires a significant investment, doing so must be balanced with other needs of the group.

Decision making involves balancing the needs of "me," "us" (my group), and "them" (outside the group). Groups work best when members have the skill of taking the perspective of what is best for the group as a whole, i.e., placing a high value on what furthers the freely-agreed-upon values and goals of the group. This skill can offset the possibility that the values of inclusivity, equality, regard, and freedom will degenerate into narcissistic forms (an over-emphasis on my needs and opinions at the expense of group needs).

It can also be useful to be aware of and explicit about the role or perspective one speaks from, which can change. For example, I can speak to my personal needs, the needs of the group or other individuals in the group (as I understand them), the needs of other groups that co-exist with my group in a socio-political ecosystem, or from a generalized moral perspective of what is ethically right. Needs at every level come to bear on most decisions, and principled decision making is helped when these levels are differentiated (to the extent such differentiation clarifies competing needs). This type of differentiation may also help untangle some questions of ethics and trust.

For each group and situation there may be a degree of trust, mutuality, or regard that lies beyond the limits of safety, rationality, or practicality. Sometimes "watching one's back" or an exaggerated confidence or self-interest is strategically necessary. Trust and tolerance for uncertainty are not things that can be thrust upon a group, or expected or demanded of its members. What is possible in most groups, however, is to reflect from a systems or group dynamics perspective on these issues. For example, it is of little use to prescribe that participants become more trusting of each other, but it may be beneficial for a group to reflect on the general level of trust of its interactions. Discussion could include whether the current level of trust is appropriate to the composition and goals of the group, and if not, what might be done to ameliorate the deficiency. At the practical level, personality style and cognitive/developmental factors place limits on the sophistication and productivity of such meta-level conversations, and in many cases, leadership or facilitation is necessary.

Balance, Yin, and Yang

For the most part, the discussion has focused on the importance of things such as reflection, multiple perspectives, dialog, caring, authenticity, and suspension of judgment, which one could say generally have a Yin (soft, open, yielding, or chaos-friendly) character. Practice and the application of theory require balancing many competing factors, and so I have also hinted at the importance of contrasting Yang-like elements, including: efficiency, accountability, rigor, precision, simplicity, and leadership.

Considering multiple perspectives and working toward mutual understanding takes time and effort, whether it is for the strategic purpose of refining knowledge or for the ethical purpose of including stakeholder viewpoints. Dialog and reflection at a process (or meta-level) likewise take time and effort that might have been spent working directly on the goals of a group. Excessive thinking about thinking, dialoging about dialog, and theorizing about theories can sabotage any collective enterprise (so-called paralysis by analysis). So in practice, a balance must be found between the expansive Yin qualities and the convergent Yang qualities. Exactly what the balance will be and how it is arrived at will differ in every knowledge building community and every context. In the end, deciding what to do may come down to elusive characteristics such as wisdom and character. I do believe that investments in the groundwork of mutual understanding, clarifying values and validity criteria, and/or skill-building will often pay off. Complex social problems, constant change, and clashing cultures and values all lead to an epistemological indeterminacy that cannot satisfactorily be dealt with using the traditional blunt "Yang" approaches of dogma and authority. Yet the "Yin" approaches of inclusivity, consensus finding, leniency, and individual freedom can be over-done as well. The Yang tools of discrimination and sharp focus need to be in the mix, too.

It was mentioned above that certainty is an important human need, and that some degree of certainty is required for action. The need for certainty contrasts with the qualities of negative capability and dialectical thinking explored above. The need to decide and act conflicts with the need to reflect and remain open to possibility. John Dewey (1929) in *The Quest for Certainty*, links the quest for knowledge to a need for certainty sufficient to allow us to take action to solve problems and achieve goals. One could say that a person "believes" something when there is enough certainty to act on the basis of its truth (i.e., knowing and doing are intimately linked).

Wittgenstein (1969), in *On Certainty*, points out that in some contexts certainty is required and to doubt is meaningless, even though truth can not be determined or proven in any satisfactory way.[27]

Uncertainty and complexity create an unhealthy pull toward renouncing or relinquishing responsibility to oneself and community, leading to inertia or lack of action. When does one close the door to new information and possibilities? When does one hold firm to deep-seated values or beliefs? How do members of a community graciously allow that there may be an unavoidable degree of hypocrisy, over-simplification, and bias in others, while still trying to hold each other to some standard of objectivity, truthfulness, and rigor? Again, these are difficult issues and the balance will differ in different contexts, but what is important is that participants make the effort of trying to find a balance that matches their values.

One approach is that suggested by Kögler and Elbow above: genuinely attempt to immerse oneself in the perspective of the other before moving into critique. In our post-modern sophistication, we know that true objectivity is not possible (in, for example, news reporting). Likewise, fully knowing how another feels, what they think, or what they have been through, is impossible. Yet, the contemporary context has not removed the moral burden placed on individuals to try one's best to include an objective perspective in one's thinking repertoire, and to try one's best to take the perspective of others before condemning them.

Cognitive as well as moral burdens are involved. Methodological pluralism and multi-perspectivalism open up a Pandora's box (stirs a hornets' nest?) of epistemological indeterminacy. Or, rather than opening it up, perhaps it forcefully brings the attention to the indeterminacy that lies unacknowledged in all knowledge building. Actually, both are the case, because epistemological indeterminacy can be self-reproducing.

Uncertainty and ambiguity beget more uncertainty and ambiguity. An awareness and understanding of the causes and effects of uncertainty and ambiguity allow an individual or group to step out of the downward spiral and deal productively with them rather than be at their mercy. Such dialog can be quite difficult, and therefore requires clear intention and strong commitment. This is not so different than noting how anger and contempt beget more anger and contempt, or how negligence and indifference beget more of the same. And that it takes a higher level of awareness, understanding of, and control over, anger, contempt, negligence, or indifference to halt the spiral. As noted in Michael Herrick's (2006) *Integral Care* (in a section titled "Fears of Wellness"), introspection and reflective dialog can put us in a variety of disconcerting states. It can call us to greater responsibilities, unveil fears of intimacy and rejection, or challenge one's sense of identity. Epistemological indeterminacy must be addressed at both personal (psychological) and group (leadership and collective intentionality) levels.

---

[27] Statements such as "this is my hand," "the earth exists," "I am not dreaming" may sound like empirical statements, but they actually represent assumptions that we must assume in order to engage in any type of action or communication. They (in most contexts) form the bedrock assumptions that form our image of the world and allow us to think in the first place, so to question them is meaningless, because it would undermine the very possibility of questioning.

Indeterminacy Analysis, Differential Analysis and Ontological Commitment

Indeterminacy Analysis

As part of a theory, the author or another party can include an "indeterminacy analysis." This is an analysis of the most important points of uncertainty, ambiguity, or fuzziness in the theory. Doing so would, first of all, reinforce the fact that all models and concepts have some degree of indeterminacy, and that it is not a defect to have them.

Key concepts can be analyzed in terms of fuzzy boundaries, graded concepts, incompleteness, ambiguity, limitations, etc. Key "graded propositions," i.e. important claims that rely on fuzzy concepts, can be noted, along with how the meaning or validity of the claim changes in response to variations in the meaning of its constituent concepts. It will usually be important to note a variety of examples, and how the validity of claims degrades for unusual or boundary examples. For example, the claim "all holons are sentient" would be annotated to show how the claim weakens for uses of "holon" or "sentient" that do not perfectly fit the intended meaning. In a similar way, we can map out the known limits of models, diagrams, etc.; discuss strong and weak contexts of application in terms of the model's intended purpose. Known problematic areas or unexplored territory can be noted.

Differential Analysis

Common responses to disagreement include asserting one's position more forcefully, more clearly, or more persuasively, and such rhetorical moves do have their place. But, following from ideas presented previously, it is suggested that it would be more beneficial for the group as a whole (and probably more beneficial to most individuals in the long run) to begin by stepping back and looking more closely at the nature or source of the non-agreement. When evaluating a model or comparing models, one can "disassemble" their constituents and lay out the components for clearer analysis—a process I will call "differential analysis." Rather than initially responding to an argument or a model "full on," one can first step back or drop to a deeper level (or look "beneath" or "behind" the idea). Deconstructing the elements of an argument allows us to evaluate them individually and identify which elements are problematic or controversial. In a differential analysis one can identify these constituents: (a) basic concepts, ontological dimensions, foundational elements, and principles; (b) key assumptions about "what is true"; and (c) pivotal differentiations, generalizations, and integrations. Such unpacking is as much related to clarifying (and thus contributing to) mutual understanding as it is aimed at finding mutual agreement or dealing with its lack. As it is also a gesture toward more completely understanding another's theory, it relates to mutual regard as well. Differential analysis may seem like a lot of effort, and one's depth of analysis will depend on how one expects to benefit from it. But I maintain that in far too many instances critics jump right into critique when a greater degree of differential analysis prior to critique would greatly benefit the knowledge building community.

Differentiation, Generalization, and Integration

Wilber's integral theory makes heavy use of the concepts of "integration" and "differentiation." For my focus on knowledge sharing and epistemology, I need to re-evaluate the meaning of these terms to make them compatible with current cognitive theories of thought and learning. Using only the two terms "integration" and "differentiation" does not allow enough precision to formulate the arguments. I will single out three fundamental cognitive processes: differentiation, generalization, integration.

- **Differentiation** (or discrimination or specialization)—seeing things (or ideas) that were once considered the same as being in some new way different (or members of different sets).
- **Generalization** (or abstraction)—seeing things (ideas) that were once considered as different as being in some new way the same (or members of the same set).
- **Integration** (including composition)—a coordination of ideas into a larger idea. "Coordination" is more than the union of the parts but a structural integration that gives the parts specific roles or relationships to each other. Integrations may include differentiations, generalizations, and other types of relationships.

I highlight these three processes in part to distinguish "integration," by which I mean the structural coordination of ideas to create a higher level idea, from "generalization," which also results in a "higher level" idea but does not structurally integrate its components. For example, the concept "mammal" can be a simple generalization that creates a set covering dogs, cats, humans, etc.; while the concept of "leadership" can be a complex coordination of ideas including responsibility, collaboration, efficient action, taking charge, consideration, maturity, etc. Below I wish to highlight the usefulness of differentiation and generalization without, or aside from, integration.

Differentiations and Generalizations as Powerful Ideas

A model (or theory) is usually a complex integration of many components and structural relationships. Models are perspectives on their components and/or the world. The theorist has invested considerable time and, through a combination of explicit rational analysis and unarticulated intuitive insights, constructs a conceptual schema. It is as if in proposing a theory one says "it all comes together meaningfully for me like this..." When a theorist presents a model to a community, the recipients must personally deconstruct the elements of the model and reconstruct them in a way that (hopefully but not always accurately or fully) reflects what the theorist intended. This takes effort and individuals and communities have limited cognitive resources. Understanding a model enough to evaluate it takes effort, and adopting it and using it to frame one's own work takes significant additional investment.

The recognition of similarities and differences is the most fundamental function of thought (and, in a biological sense, of life as well). All modes of reasoning, learning, problem solving, etc. rely on this basic cognitive capacity (or capacities). Contrast the simple yet powerful cognitive tools of differentiation and generalization with the more complex, also potentially powerful, cognitive models (theories, schemas, etc) described above. Though models can be powerful integrations of ideas, they carry more cognitive "baggage" and require more cognitive investment than differentiations and generalizations, which are more elementary and singular, and "portable." Models have a top-down quality: they encourage us to look at a chunk of reality in a certain way—they define how things are connected. Differentiations and generalizations have a more bottom-up quality, ready to be re-used in many contexts.[28] They draw attention to new features of a situation.

I have argued for the importance of using multiple models for understanding and problem solving, as each model has its limitations. Each model makes use of a number of important differentiations and generalizations, and integrates these into a larger unit of meaning. In differential analysis, we harvest the maximum benefit from these elements, and judge the full model as a separate step.

In most contexts, the skills of negative capability and dialectical thinking are essential to the process of differential analysis. By first softening the hold of one's own beliefs, and then opening to what new perspective the other might present, we are better able to disassemble the components of a complex belief system and appreciate the partial truths and useful differentiations and generalizations that it contains.

Minimum Ontological Commitment

To finish my discussion of differential analysis I will bring in the principle of "least ontological commitment," a kind of Occam's Razor for knowledge building. The concept of ontological commitment is one of many concepts originally limited to philosophical discourse that has been appropriated by those working in the field of artificial intelligence and its subfields of "knowledge acquisition" and "knowledge representation." Theorists in these fields are concerned with how information and knowledge can be represented digitally—initially for the purpose of enabling machines to "think" and solve problems, but increasingly also for the purpose of allowing humans to encode knowledge in ways that make it widely available, findable, and reusable under various contexts.

Thomas Gruber (1995), in setting out principles for the establishment of base vocabularies and ontologies for knowledge sharing, proposes a principle of "least ontological commitment." To wit:

> an ontology should require the minimal ontological commitment sufficient to support the intended knowledge sharing activities. An ontology should make as few claims as possible about the world being modeled, allowing the parties committed to the ontology freedom to specialize and instantiate the ontology as needed. Since ontological commitment is based on consistent use of vocabulary, ontological commitment can be minimized by specifying the weakest theory (allowing the most models) and defining only those terms that are essential to the communication of knowledge consistent with that theory (Gruber, 1995, p. 4).[29]

---

[28] Of course the converse is also true: models can also be re-used in many contexts and differentiations and integrations are ways of looking at the world. But the top-down vs. bottom up analogy is only meant to be suggestive that the more complex constructs are less re-usable or portable and imply a more constrained view of the world as compared with the simpler constructs.

[29] Borst (1997, p. 67) adds that "roughly stated, statements of an ontological theory must be true in every possible world; ontological commitment comprises the set of possible worlds thus allowed by the ontological theory specification....In our opinion, there are two practical dangers: excluding acceptable possible worlds, but also including undesired ones."

Examples

In a manuscript I have under development (Murray, 2006b), I include some alternatives or extensions to integral theory that will illustrate aspects of my suggestions for dealing with epistemological indeterminacy. These alternative models are not thought to be more valid or even useful than already proposed models, but are given to illustrate limitations to existing models and to models in general. They illustrate the following ideas mentioned in this article, summarized below.

- Minimum ontological commitment
- The essential dialectic between examples and abstractions, and the use of central, boundary, and negative exemplars.
- Problems with the non-linear and non-hierarchical relationships among.
- Graded concepts and graded propositions.
- Indeterminacy analysis—i.e., explicit statements about the limits of models and concepts.
- Differential analysis—emphasizing differentiations before integrations.
- Issues in confusing maps with territories 1: Problems with transferring properties of diagrams to a model's interpretation.
- Issues in confusing maps with territories 2: problems with transferring properties of pronouns (I, we, it, etc.) or other linguistic categories to a model's interpretation.

Validity Criteria for Integral Theories

Here I will propose some specific things about integral methodology and the validity of integrally informed theories. Integral theories use methodological pluralism and multiple perspectives to arrive at more encompassing and robust truths or models. Above I argued that the primary job of such theories is meaning-making. I also argued that in any field (and in general) there is no single criterion for truth or validity, and that the overall validity, quality, or agreeability of a claim or model comes from a fuzzy, fluid combination of many senses and sources of validity (though each field or community can agree that certain validity criterion are more important). I also mentioned that the meaning and validity of a claim or model depends on the purpose, use, or task at hand.

Combining all of the above with the earlier definition of "integral," we can say that the validity of an integral (or integrally informed) theory depends upon the degree to which it:

1. Addresses **all levels and quadrants** (i.e., science/morals/art, body/mind/spirit, nature/self/culture); and (for extra credit) does so in a balanced way; i.e., it has sufficient scope (depth and span) or agape;
2. Serves to **integrate** (synthesize) and/or **differentiate** (distinguish or refine) important concepts, sometimes creating new terms/concepts as it does; (and points out important and unacknowledged relationships and connections between fields or perspectives);
3. "**Transcends and includes**" rather than transcending and excluding, previous theories and ideas;
4. Offers a **simple, elegant**, parsimonious, and/or perspicuous way to conceptualize a large number of ideas (i.e., that the orienting generalizations orient rather than confound);
5. Optional (extra credit): Proposes **developmental/evolutionary** causal or teleological explanatory mechanisms.

Adding general validity criteria from the above discussions implies that an integral (or integrally informed) theory depends additionally upon the degree to which it:

6. Includes explicit knowledge about the model's **assumptions, limitations**, fuzzy boundaries, biases, etc.;
7. Is **understandable** (defines terms, is consistent with the use of terms);
8. Has internal **consistency** (in its claims and models);
9. Has external **coherence** (is consistent with other established theories and ideas; that its claims are implicated by a plurality of other models or perspectives);
10. Sites **legitimate sources** for data and theoretical coherence, and facilitates the reader in determining the legitimacy of these sources;
11. Grounds itself in **examples**; includes positive, negative, central, and peripheral examples; is resilient to counter-examples;
12. And finally is characterized by **appropriateness**, sincerity, authenticity, and respectfulness.

Integral theories can be evaluated in these dimensions and can be compared along these dimensions. The above analysis is provided so that when an idea is critiqued the critic can be clearer about what dimensions(s) of validity is being addressed. In the end, the adoption or general acceptance of a theory or model depends not so much on how it is explicitly, mechanically, or formally evaluated in terms of such criteria, but on the personal sense, accumulated over individuals, of how it "fits," "feels," "works" or "makes sense."

More Recommendations

Let's Talk About It

One of the key recommendations is simply for groups to dialog explicitly about the types of issues raised in this article. This means raising context-grounded questions about uncertainty in knowledge, interpretation and bias, validity criteria, how conflict and differences are resolved, social vulnerabilities, trust, and power. Doing so is not easy. It requires certain skills, attitudes, and knowledge, depending on the depth and scope of the discussion. It must be focused on the actual issues at hand and not allowed to stretch too far into abstract philosophy or other tangents. Having individuals take on roles of facilitation or leadership will be necessary in most cases. Skill building or training may be useful in some contexts. Though engaging in dialog at this level is not by any means easy, doing even a tiny bit more of it can be beneficial to most groups. Though the topics may seem abstract and deeply philosophical as presented in this article, in practice much of it comes down to basic skills in listening, authenticity, empathy, and perspective taking.

Such meta-dialog is the collective level of the subject-becomes-object moral and epistemological development that Robert Kegan (1994) mentions in *In Over Our Heads*. In addition to the individual reflections on the properties of the group, the group as a whole (multilaterally) can develop awareness and reflectivity on group behavior. This, combined with a consensus-building process around a group's vision and values, can lead to group-level self-regulation. (This type of awareness is also discussed in Kegan & Lahey's (2001) *How the Way We Talk Can Change The Way We Work*).

Each group can be said to have a collective level of skill in these basic areas. This collective skill level is in part an average of the individual skills of the participants, but also depends on how these skills are supported at a systemic level within the group. Support at a systemic level will (a) allow the existing level of skills in individuals to fully manifest in the group context, and (b) support the practice and improvement of these skills by all, even those with lower-than-average skill levels.

Document Structure and Content

In the 21st century, the vast majority of knowledge building efforts involve digitally stored information and on-line collaboration. Using electronic tools to create and share information gives us new opportunities to systematically support knowledge building. Some sources of epistemological indeterminacy can be managed or ameliorated by making sure the following types of information are included in electronic documents.

- **Ground concepts and models in examples**. As prescribed by instructional design and cognitive theories, examples are best organized explicitly into categories such as typical cases, extreme cases, borderline cases, counter-examples, and analogies; and should be representative of a variety of contexts (Merrill, 1983; Gagne, 1985; Anderson 1983).
- **Include multiple perspectives.** Link ideas to-multiple representations, alternative theories, models, and perspectives. Allow alternative ("crisscrossing" or "spiral") paths through densely connected concepts (see "Cognitive Flexibility Theory," Spiro & Jehng, 1990).
- **Cross-reference conceptual links** (among ideas, concepts, principles, models, etc.).
- **Provide links to related material**, including: sources, examples, definitions, alternative perspectives, etc.
- **Itemize, label, and summarize** (make it easy to skim documents).
- **Articulate assumptions, values, premises**, etc. See "indeterminacy analysis" and "differential analysis" above for some ideas on how to do this.

Cognitive Tools and Information Technology

"Cognitive tools" include templates, procedures, and conceptual models for use in communication and knowledge organization. Well known technologies such as Wikis, discussion forums, and electronic voting form the basis of such tools, allowing groups to create an evolving "knowledge commons," and a significant amount of innovation is occurring in this area. The details of such technology it is beyond the scope of this article, but I explore some of these themes in my work on the Perspegrity project and the Metalinks project (see Murray & Benander, 2005; Murray, 2003b; www.tommurray.us).

A key technical capability, one that is already widespread, is the ability to manage multiple versions of documents. Texts and knowledge bases should be built to allow the knowledge of an individual or community to evolve, so that the current state of thinking is apparent or easily accessible when reading about an idea that has been improved upon. (But older versions should not be discarded, both for historical/archival reasons and because in they end they may turn out to be more adequate than something that succeeded them). Managing multiple versions of documents also facilitates collaborative authoring.

Tools are of little use if a community does not develop and share a set of practices, methods and attitudes associated with the tools and their intended goals. Thus the optimum conditions involve a relatively well-defined (though not closed) community that supports the levels of investment and trial-and-error needed to implement new practices.

Dialog Phases and Moves

Discussion forums can be structured such that points of order or other process-related or meta-dialogic contributions can be tagged as such. Special forums or "rooms" can be created for groups to move to when they want to dialog about group "shadow," trust, or power dynamics. Such tools allow the main discussion, the primary work and mission of the group, to remain "clean" of the machinations of important tangents.

As another example, group work and dialog tends to move through noticeable phases, and each phase has certain constraints or needs that can be supported through facilitation procedures and/or collaborative tools. Such phases include: (a) global questions—to establish the values and goals that bring a group together, (b) clarifications—to build mutual understanding and background information regarding specific issues; (c) preliminary "tweaking" and reality checking—to shore up weak areas and eliminate blind alleys that would otherwise lead to inefficient dialog; (d) Divergent, evaluative, and convergent dialog—that dives into the center of discussion, brainstorming, problem solving, and planning; and (e) Meta-dialog and dealing with indeterminacy—describing process awareness and group self-regulation methods that can be used throughout.

Conclusions

A community of integral theorists is a knowledge building community. Though epistemological indeterminacy (uncertainty in understanding, knowing, and communicating) affects all aspects of modern life, it is particularly salient and important in knowledge building communities. Because knowledge building communities represent and evolve knowledge explicitly, the causes, effects, and approaches to epistemological indeterminacy (EI) can be directly addressed in knowledge building practices. Because knowledge building communities are "communities," one can realistically imagine concrete contexts for studying and dealing with EI.

Because multi-persepctivalism and integral methodological pluralism constitute the core of integral theory methodology, integral theory highlights IE—its manifestations and its problematic repercussions. In my examination of web-based integral theory texts, I noted several problematic elements of the knowledge building community and its practices. It was not difficult to find instances where authors overstated, oversimplified, misunderstood, and misrepresented each other's ideas. Authors were found to be at times hypocritical, overly critical, not critical enough, biased, ambiguous, inconsistent, and even mean-spirited. Or at least a reasonable argument could be made supporting these judgments. "Welcome to the real world," you might say. And indeed, I made the point that the investigated community is not so different than most knowledge building communities in these respects. In addition, the exploration of epistemological indeterminacy has shown that most of these phenomena are to some extent unavoidable and ubiquitous.

But to some extent these phenomena are avoidable. And there are reasons for avoiding them. From the perspective of knowledge building, these phenomena add to inefficiency, inaccuracy, incompleteness, and mistrust. All other things being equal, communities would like their knowledge building to be as efficient, accurate, and complete as is practically possible, and to build trust and social capital with each interaction. In the specific case of integral theory, a failure to deal adequately and directly with EI threatens the integrity of the entire project, since its method is founded on multiple perspectives and its most prevalent topics of inquiry deal with abstract concepts and subjective realities.

That EI exists, that knowledge is socially constructed, perspectival, and evolves; that models are "only maps" of the territory—all this is quite generally recognized in an abstract sense. But less often do individuals or groups identify the specific causes and effects of these indeterminacies, with a goal of ameliorating pervasive problems in the knowledge building process in specific contexts. More often, EI is treated as an unavoidable, undecipherable, and unmanageable nuisance.

In this paper, I propose that participants prudently adapt to the problems of EI to the extent that they are unavoidable, and reduce the problems when this is practically possible. Though it is very difficult to say in advance or in general how much indeterminacy is unavoidable and which manifestations of it are correctible, what can be said with confidence is that epistemological indeterminacy is a phenomenon that people can develop some (or more) understanding of and sophistication with. Though complex and not treated in any explicit way in most communities, its causes and effects can be partially explained, and the resulting understanding could benefit knowledge building communities.

My recommendations can be interpreted as having three phases: awareness of the phenomena, understanding the phenomena, and offering some tools (and some hope) for dealing with it. A first step is for the participants in an integrally-informed community (or any community) to note that EI and its problematic effects do in fact exist for them. A second step is to increase understanding of the relationship between the causes and effects of EI, and to promote dialog within a community that deepens this understanding within particular contexts. A third step is to adopt practices and tools that help deal with EI. Awareness, and to some extent understanding, may lead initially to despair as the extent and inescapability of the problem becomes apparent. People tend to ignore what is not understood or cannot be changed, and so the first two steps of noticing and understanding tacit patterns can be jarring. But my aim is that the complete picture I have presented, along with suggestions for certain tools and methods, will create more hopefulness than despair, and will instigate a productive discussion within the integral theory community about these issues.

Summary

Below I summarize the main points of the article in terms of (a) sources of EI, (b) effects of EI, (c) ethical considerations from EI, and (d) recommendations and tools for dealing with EI.

A. Sources of Epistemological Indeterminacy

Indeterminacy in understanding (interpretation) and agreement (truth or validity) has numerous sources, and dealing with EI requires some level of familiarity with these sources (on the part of leaders or facilitators, if not all participants). The sources of EI include:

The cognitive nature of concepts, claims, and models

- The fuzzy or **graded** nature of *concepts* (terms and categories);
- The **metaphorical** nature of abstract concepts and the radical interdependence of the meaning of one or idea with that of many others, such that none of them is unambiguously primitive (to identify some as primitive is to take a perspective);
- That *statements* (propositions or claims) are indeterminate because their constituent concepts are indeterminate; **claims are true "to the extent that**" the situation referred to corresponds with the most typical or representative exemplars of the conceptual categories used;
- ***Models*, theories and frameworks** are indeterminate because their constituent concepts and claims are indeterminate; and because they, by their nature, are approximate, abstractions, and simplifications over actual occurrences, and the choice of what to leave out depends on one's perspective;
- The meaning of abstractions **depends on references to real examples** (positive, negative, near, extreme, boundary, etc.); yet real examples can never be fully described (again, what properties are ignored depends on one's perspective); there is a dialectic process of refinement between an abstract idea and the set of examples used to explain it.

Psychological and social sources

- **Individuals** bring a variety of **distortions** to their interpretations, including their goals, values, knowledge, history of experiences, and unconscious motivations and biases, making "pure" objectivity impossible;
- The brain creates a "**society of minds**" in that people can entertain or even believe conflicting things or use conflicting models (as conscious beings we are not of "one mind");
- The meaning of a concept, belief, or model is constructed intersubjectively and idiosyncratically; **meaning evolves** in and through individual interpretation and social processes of meaning negotiation; meaning is dynamic, fluid, and distributed.

Philosophical or truth-related sources

- There are many **meanings of truth**, and many criteria for determining validity, and the truth or validity of a claim or model depends on which of these is used (usually these choices are not articulated);
- Validity has **procedural, communal, dialectic, and perspectival elements**, which together can make determining the validity of a claim or model a complex and indeterminate process.
- Integral theories are primarily **organizational or explanatory**, making their validity depend more on issues of **meaning-generation** and practical usefulness than on empirically determined truth. (In the section "Validity Criteria for Integral Theories" I listed a number of criterion).

B. Effects of Epistemological Indeterminacy

We have mentioned several direct and indirect effects of EI:

- If ignored, EI can lead to the production of **invalid, limited, or unusable knowledge**;
- EI increases the **vulnerability** at stake when one articulates one's ideas;
- EI expands the **opportunities for critique** (both valid and malicious or inappropriate);
- Trying to *deal with* EI can create additional pockets of uncertainty and vulnerability;
- Dealing with EI **takes time and energy**, so the benefits of doing so must be weighed against other priorities;
- EI, if ignored, can lead to corrosion of trust and solidarity in a group;
- Dealing with EI effectively takes skill and a **balancing of many factors** if excessive thinking about thinking, dialoging about dialog, or theorizing about theories is to be avoided.

C. Moral/Ethical Factors

Ethical considerations (such as mutual regard) are inextricably woven into processes of building understanding and finding agreement. I showed how understanding, agreement, and regard formed a braided whole, with each element depending on the other. Related points about ethics and affect include:

- **Trust** and mutual **regard** are critical elements to valid knowledge building;
- Mutual understanding and mutual agreement are developed through communicative processes that both presuppose and rely on basic ethical principles such as **equality, freedom, reciprocally, and authenticity**;
- Taking multiple perspectives has **emotional** as well as cognitive challenges, as in temporarily yielding one's own beliefs or trying to empathize with the perspective of someone very different;
- An acknowledgement or awareness of uncertainty is at odds with basic psycho-biological **needs for certainty** and simplicity (and a group's tolerance for uncertainty should be considered in adopting approaches to EI);
- The dynamics of power **and privilege** can have a strong impact on the quality of knowledge building, and thus must be examined;
- Ethical choice relies on the moral perceptive faculty of **empathy**, which is related to a type of perspective taking.

D. Recommendations for Dealing With Epistemological Indeterminacy

How can an individual or group possibly deal with all of the sources, effects, and factors described above as? The simple answer is that we already do—but (usually) not consciously. In everyday interactions with others who have a different opinion or perspective we intuitively scan for all of these factors and deal with the ones flagged as relevant or critical. This can be demonstrated by noting that if we imagine any one of the factors mentioned existing in the extreme, it would be obvious to most people that there was some uncertainty or ambiguity that needed to be accounted for. What we don't do so much is reflect on how we do this, dialog explicitly about how we do it, work to improve how we do it as individuals, or systematically work to improve how we do it in groups. Each person of course has their own very idiosyncratic approach to dealing with EI, and articulating and dialoging about our (mostly tacit) approaches would be quite difficult. But, we are not starting from scratch with the naïve intuitions of participants. Rather, in this article I have presented some established philosophical, psychological, and sociological theories as starting points for individual contemplation and/or systematic group consideration.

The article included these **recommendations** for how groups can deal with EI:

- **Dialog** explicitly about EI, its causes and effects (not as easy at is sounds, and requires commitment, leadership, and patience);
- **Support** the development of the cognitive and affective skills related to **negative capability**, which are also describe as: epistemological sensitivity, dialectical thinking, reflective suspension of judgment, letting go/letting be/letting come, the Believing Game, and dwelling in and with another's words;
- Support the skill of **differentiating the (perceived) needs and goals of self, group**, and outsider/other; and explicitly speaking from each perspective;
- Employ "**indeterminacy analysis**:" the analysis of the most important points of uncertainty, ambiguity, or fuzziness in a model or claim.
- Employ "**differential analysis**:" identifying key differentiations, generalizations, and integrations in a model or claim, with an emphasis on reusable differentiations and generalizations.
- Other recommendations concerned **knowledge representation** (the structure and content of documents and textual dialogs), including the use of **technology** to identify, manage, and ameliorate IE.

Concluding Thoughts on Awareness, Engagement, States, and Stages

My focus has been on the nature of knowledge and knowing as it impacts human collaboration. More specifically, I focus on the indeterminacies, uncertainties, and ambiguities in knowledge and knowing, and how this impacts human efforts to build knowledge. But what was uncovered in the course of exploring this limited territory has broader implications. Awareness and understanding of this aspect of mind is closely related to the broader types of awareness referred to when philosophers and spiritualists speak of contemplative practices and insight. The reflective turn, looking within oneself with an authentic intention of creating a deeper, broader understanding of thought, mind, and heart, leads to a certain set of intuitions regardless of the contemplative practice used. I focus on the phenomena of uncertainty here, but it quickly leads out to perennial topics such as: the intersubjective and collective nature of mind(s); questioning whether mind or "I" (or reality for that matter) exist in the traditional sense; themes of caring, regard, equanimity, and compassion; and the psychological, but ultimately ethical and spiritual, vulnerabilities and openness of the human social condition.

My recommendations point to an experiential and enacted forms of awareness and understanding, not a purely philosophical ones. The concrete practices that reify my suggestions put awareness to work in the world while they develop it. They are contemplative practices, but they are done for the most part in social contexts (for example, dialog and knowledge building practices). Thus, my recommendations are a form of engaged contemplative practice. Socially engaged contemplation forcefully brings in the ethical dimension, which one risks leaving as remote in strictly private contemplative practices.

Wilber's work helps us make clear distinctions between states and stages of consciousness or awareness. Importantly Wilber (and colleague Coombs) have clarified that "a person will interpret [a state or experience] according to the stage that they are at" (Wilber, 2005b, p. 53). The experience of a state of consciousness is colored by our general stage of development and the belief systems tied to that stage. The interpretation of a contemplative or spiritual or ethical experience is as important as the raw experience itself. In this article, I have brought in many theories of mind and group. I do not believe that participants in a knowledge building community all have to become philosophers to be able to deal productively with epistemological indeterminacy. But along with developing awareness of mind and group through experience and practice, it is important to have an adequate understanding or conceptual framework from which to interpret and apply this awareness. Reflection and dialog can lead to important new awareness and experiences, but the transformative potential of these experiences depends on how they are interpreted. The question of exactly which elements of theory or what degree of theoretical depth is most perspicuous is of course an empirical and context-sensitive one. But I hope that the themes that I have outlined provide an adequate starting point.

Developing this type of awareness is not a project for the individual. For one thing, the issues are as much intersubjective as subjective, and thus must be understood from a systemic perspective and investigated through dialog. But more importantly, the patterns of non-awareness and indifference are so ingrained into socio-cultural forms of collaboration that it is only through collective intention that we can hope to change them. Communities can generate this type of collective awareness and wisdom through a solidarity of iterative dialog, trial-and-error practice, and good will.

Continued Growth: Further Expansion for Integral Review

Welcome to the third issue of *Integral Review*. With this issue, we accomplish our goal of producing issues on a semiannual basis, and continue to expand the community of authors, reviewers and readers of IR. With the publication of this issue, we also announce some exciting new additions to IR that we believe will support this community even further.

First, we are pleased to announce the formation of the *Integral Review* Editorial Advisory Board. This Board is a group of highly qualified individuals who have made intellectual and social contributions that are consistent with IR's mission and orientation. These volunteers provide support to the Journal's Editorial Board by extending our community into theirs and playing a mentoring role for our continued growth. We would like to welcome Michael Basseches, Ervin Laszlo, Ian Mitroff, Nancy Roof, Peter Russell, and William Torbert to this Advisory Board. You can find more information about each of these advisors on our website.

Second, we will implement online forum software to host ongoing dialogues on articles published in IR, and we are actively soliciting and supporting participation in such dialogues. IR's home page has a link to information about the initial forums based on selected articles in this issue. Please note that this issue's first article outlines the purposes and various guidelines related to different kinds of forums. We aim to have these dialogues begin in January.

In addition to the intrinsic value that participants in the integral dialogue forums may realize, we believe that these online knowledge building venues may become the basis for future articles, essays, or other types of works to be published in IR. This would become a cycle of original contributions being built upon by the contributions made in these forums, with the outcomes of the dialogues generating new original contributions, which may be built upon by further forums, and so on. This would be organic knowledge building, one quality of an openly collaborative community of inquiry.

I would also like to welcome Tom Murray to IR's Editorial Board. Tom brings a wealth of experience and insight into the arena of knowledge building communities, as he demonstrated in his article in Issue #2. Our capacity to support the dialogues described above has been greatly enhanced by his contributions to the Editorial Board, and we look forward to our continued work together.

As a brief note, I would like to mention that we have not yet seen the launch of *AQAL: Journal of Integral Theory and Practice*. Continued conversations with them have made us aware of some of the larger changes and challenges in the Integral Institute that have continued to have an impact on the expected publication of the journal. Thus, in this current issue, IR has not published reviews of articles from *AQAL* as Issue #2's Editorial anticipated, but we are looking forward to doing so in the future.

On the Contents of Issue #3

As indicated above, Issue #3 begins with an outline of purposes and guidelines for integral dialogue, in Tom Murray's and Sara Ross' *Toward Integral Dialog: Provisional Guidelines for Online Forums*. This piece brings together elements of both authors' experience in dialogue as a

SOME RIGHTS RESERVED

tool for knowledge building, combining theoretical background with practical examples and guidelines. It will serve as a point of reference for participants in the online dialogues hosted by IR, and its premises are transferable to other settings.

This is followed by a poem from Barbara Nussbaum, entitled *Tomorrow's Sunrise – A Plea for the Future You, Me and We.* To contribute to our reflections, Barbara takes us through a shifting set of perspectives woven together by her sense of our common humanity.

What happens when you bring together a group of people passionate about applying integral theory to international and local community development issues? You get *Four Days in France: An Integral Interlude,* a personal narrative by Tam Lundy on the excitement, enthusiasm and community that arose during this event. This informal report is a lovely mix of scene setting and insightful reflection conveying the spirit of those days.

Next, we have a *Rationale for an Integral Theory of Everything,* a description of the broad vision held by Ervin Laszlo on how this theory of everything could come to be. The brief, introductory article points out the role of science in coordinating our understandings of energy and "in-formation" that are essential to a theory of "every-*thing."* We are happy to have this contribution from one of our Editorial Advisory Board members.

This is followed by my short book review of Nathan Harter's wonderful, recently released *Clearings in the Forest: On the Study of Leadership*. I thoroughly enjoyed both the depth and scope of vision Harter presented in this work, and highly recommend it to those interested in the study of leadership.

Another kind of review comes from Bonnitta Roy, in *The Map, the Gap, and the Territory,* a critical examination of methodological issues raised by two Matthew Rentschler articles on the topic of Integral Art, posted on the Integral University website. Bonnitta's approach aims to takes us deep into the territory of art itself, to deepen how we approach making maps of such territory.

A beautiful example of the process Bonnitta describes is found next in Andrew Campbell's *The Dance Integral*. The opening piece of art came out of a story I told him in an early email exchange, and it continues to reveal layers of meanings and depth for both of us. Campbell writes as an artist about the creative process in a way that is deeply illuminating, and applicable to profoundly deep aspects of our lives.

We then have a German language opinion essay by Roland Benedikter, *Three Avant-garde Currents Within the Contemporary Intellectual Life in the United States – and in Their Relationship to Europe.* The essay, as the title indicates, examines the relationship of American integral thought, represented by Ken Wilber, Andrew Cohen and A.H. Almaas, to what is going on in Europe. These reflections offer a window into possible further dialogue between the continents and strains of thought within them.

Daniel Anderson also examines different strains of integral thought, specifically in Sri Aurobindo's work and its influence on the origins of integral theory. *Of Syntheses and Surprises: Toward a Critical Integral Theory* is a penetrating critique of how historical, contextual issues have played unacknowledged roles in the development of integral theory. He examines the origins of Aurobindo's "imperative to integrate" and offers direction for steps forward toward a critical integral theory.

Michael Commons introduces us to some of his latest thought, which crosses disciplinary boundaries on general intelligence (g) in a paradigmatic model that transcends and includes them. In *Measuring an Approximate g in Animals and People,* Commons outlines some of the background on how theories of intelligence have developed, then indicates how his approach to general intelligence applies across species. This fascinating and controversial piece breaks new ground in the field, and we are pleased to be able to publish it here.

Russ Volckmann has contributed another fine interview, this time with long-time international development practitioner Courtney Nelson. *Integral Development: An Interview with Courtney Nelson* is a wonderful journey through Nelson's life of service with specific cases. He shares how his work in many developing countries led him to realize why the primary emphasis should be placed on human development when designing international aid and economic development programs.

We conclude this issue of *Integral Review* with Bonnitta Roy's *A Process Model of Integral Theory*. This is a substantive work in which Bonnitta brings together Eastern concepts of process with Western ones. It shows how a process *view* can open up new possibilities for understanding aspects of integral theory such as development, cognition, and more, including our own lived experience. This article challenges some very deep assumptions about how integral theory has been developed, and can be mined for a long time to fully reveal its depths.

I am very pleased to see this third issue of *Integral Review* come together the way it has. The variety of pieces, the depth of scholarly work, and the breadth of vision found in these pages should serve readers well.

Sincerely,

JReams

Jonathan Reams,
Editor-in-Chief,
Integral Review

Toward Integral Dialog:
Provisional Guidelines for Online Forums

Tom Murray and Sara Ross

Abstract: This short article announces the launch of an experiment: *Integral Review* (IR) online discussion forums. It introduces their purpose and discusses the intent of the dialog guidelines that we are developing. The guidelines stem from our desire to explore not only integral theories but integral modes of communication and collaboration. We offer some reflections on the kind of culture we hope the forums create, and the dialogical behaviors, attitudes, and knowledge building characteristics that such a culture might exhibit. We describe our initial attempt at articulating guidelines for integral dialogs, expecting that these will evolve through participant suggestions and through the trial and error process of using them.

Keywords: online forums, integral dialog, Integral Review, knowledge building, culture

Introduction

Starting with this issue of *Integral Review* (IR), we will be experimenting with online forums for discussion about papers and other published pieces and topics in the Journal. We have several kinds of forums in mind, each using a different set of guidelines and processes, reflecting different degrees of structure and rigor (all will use the same discussion forum software). These guidelines are experimental and under development. Thus, as we launch these forums, their dialogs will be shaped by a combination of:

1. The focus of the discussion (e.g., a published work);
2. The makeup of participants (sometimes an invited group, sometimes on open group);
3. The guidelines and structure for that discussion (guidelines are described below; structure includes such things as distinct phases of a dialog, each with a different purpose).

We hope that these dialogs will respond to a need that has been developing over recent years. In our complex world, no single one of us has enough knowledge, exposure, and experience to “go it alone” in meeting challenges we are interested in and venues are needed that allow "collective intelligence" to emerge. Online tools have been touted as offering solutions meeting this need, yet productive knowledge building can be elusive in online environments. We need communicative spaces with more sustainability than list-serves usually provide, with their divergent spurts of activity without closure, summary, or further use. We need spaces where we are more than solitary bloggers and blog-commenters, and where participants have a certain level of commitment to engagement and mutual regard. We need spaces that promote helpful critique and feedback to refine knowledge and that build up understanding and relationship, rather than weakening it with shoot-from-the-hip commentary. Our online dialog experiments will be one small step toward addressing these complex concerns.

SOME RIGHTS RESERVED

IR’s motivation to offer these forums—and perhaps people’s motivations to participate in them—springs from a range of intriguing questions. Some of these are: What does “integral” look like in *action* (in this case communicative action) as well as in theory? What are some of the defining characteristics of an "integral dialog?" What might integral dialog look like "on the ground" as individuals discuss controversial issues, build knowledge collaboratively, or engage in planning and decision making processes? There are many possible answers and visions. Here we describe our starting point for exploring online dialog about *Integral Review* articles and larger issues of theory and practice as approached from an integral perspective. Our goal is not to characterize integral dialog in a definitive way but to engage in the "action inquiry" of discovering its contours through engaged trial-and-error. We look forward to a collaborative co-evolution of these structures and guidelines, and the culture they may create.

Characteristics of Integral Dialog

What does integral theory imply for the properties of knowledge-building dialog processes? (We could ask the same question about integral decision-making processes, a related subject outside the scope of this short article). To clarify what is meant here, we are *not* talking about dialog that references integral theory. One should be able to evaluate a dialog taking place between, say, urban planners or biologists, who know nothing of integral theories, and ask whether the exchange reflects integral dialog characteristics.

The primary characteristics are that *multiple perspectives* are included and transcended, and that *interior realities* as well as exterior realities are valued. These primary characteristics lead necessarily to others, such as: a tolerance and resilience in the face of uncertainty, contradiction, and ambiguity; the presence of multi-perspectival or dialectical reasoning; and an ethic of mutual recognition and regard that compensates for the social vulnerabilities introduced by multiple perspectives and first/second-person revelations. We expand on these characteristics below.

In a general sense the integral method is an approach that, as Ken Wilber says, "in the presence of apparently incompatible, conflicting, or unrelated data, tries to make a productive, creative synthesis of the divergent elements" with a "gracious, spacious, and compassionate embrace" (Wilber, 2000, p. 49). It is not simply a non-rigorous stance that "everyone is right," but rather an understanding that if there are differing ideas they probably come from different perspectives, and all *perspectives* have validity, rather than that every *idea* is right. The distinction between perspectives and ideas is an invitation to enter more deeply into "where someone is coming from" as we respond to their explicit words. This constitutes using a vision-logic or aperspectival form of imaginative reasoning (Wilber, 2000; Feuerstein/Gebser, 1987). This kind of reasoning is used to not only interpret a particular claim but to holistically contemplate what has been heard from, and of, the other and consider the threads of authentic wisdom that may lie beneath or within the claim. Ideally, this leads not to additional layers of troublesome assumptions about the other, but to a curiosity that fuels more dialog and deepens mutual understanding. To transcend and include is to access a view that can hold the validities of many perspectives, but not *necessarily* offer a synthetic overarching model or narrative (a single view) that encompasses them. To transcend and include can also mean discovery that the complexity of a subject can have multiple layers that call for a complex blend of views or approaches. We might say that it is so rare to encounter dialogs that reveal such things, that this alone may be a worthy reason to be curious: to discover what this would look like by developing it first-hand.

Opening up to multiple perspectives, both from other participants and within one's self, exacerbates "epistemic indeterminacy"—the inherent (or revealed) uncertainties, paradoxes, context-dependence, and dynamic unpredictabilities of knowledge and knowledge creation (Murray, 2006a). A set of cognitive skills is needed to work within epistemic indeterminacy. These skills have gone by various names, including: negative capability (Keats, 2004), dialectical thinking (Basseches, 2005), proprioception of thought (Bohm, 1996), the believing game (Elbow, 2005), reflective judgment (King & Kitchener, 1994), cognitive empathy (Vetlsen, 1994), self-distanciation (Kögler, 1992), strategist action logic (Torbert & Associates, 2004), and the metasystematic order of hierarchical complexity (Commons & Richards, 2003). Together we can refer to these skills as "epistemic sophistication" or "epistemic awareness" (Murray, 2006b). Put simply, epistemic sophistication is about how individuals think and dialog about "I don't know," "I'm absolutely sure," "I disagree" and "prove it!" in productive and respectful ways. These skills are found in many individuals, but the challenge of the day is to discover frameworks, methods and tools that support systematic and community-level development and application of these skills.

Integral theory (Wilber, 2000) and action inquiry (Torbert & Associates, 2004) suggest that dialog should include explicit first-person and second-person perspectives along with third-person perspectives. This means that, along with third-person orientations such as describing objective circumstances, finding empirically validated truths, or identifying statistically probable futures, dialog should include an acknowledgment, clarification, and/or exploration of: (a) the values, goals, feelings, etc. of the author or speaker; (b) the relevant relationships among participants; and (c) the values, intentions, and methods that characterize (or should characterize) the collective process. Second-person perspectives are explicitly sought out via inquiry in dialog. (And see Jordan's [2002] Conflict Awareness Mandala for a more detailed model of first, second, and third person perspectives).

In addition to more traditional forms of explanation, analysis, and synthesis, an integral dialog may contain the following types of statements that are not common in traditional academically styled knowledge building dialogs (they are illustrated in informal vernacular, but could also appear as more academically stylized):

- I really don't know. But my current best guess is…
- I have two seemingly opposing thoughts or impulses going on here, which are…
- I was wrong about that. Thanks to your comment I checked it out and …
- The author is a long time friend and colleague of mine, which may bias my opinion.
- You said that you would address my three questions but as far as I can tell, you missed the third. Would you address that one also?
- I felt some frustration and anger upon reading your comment. Let me try to explain…
- Let me see if I am interpreting your position correctly… Do I understand it the way that you mean it?
- Are you making this assumption…?
- Would you be willing to tell me what you think I am saying, as you understand it?
- Both perspectives seem valid to me, and each is valid in a different way, as follows….
- What is our purpose here? Is our process aligned with it?
- I think it is going to be important for us to… because …
- Would some of you like to start a separate discussion thread about how we can make this dialog more productive?

Our guidelines encourage trust and allow for a certain level of vulnerability that we hope will allow participants avoid the polarizing and pontificating styles found in many online venues. We encourage revealing layers of the self and the exploration of topics and questions rife with uncertainty, paradox, and ambiguity. In addition to behaviors that state what is known and advocate for what is wanted, we hope to support behaviors that help participants collaboratively unpack, examine, re-form, and create knowledge (along the lines of "letting be, letting go, and letting come," as suggested by Otto Scharmer, 2006).

This is not an invitation to be slipshod or narcissistic. Our aim is to develop guidelines that will support rigor, clarity, and efficient knowledge creation. Authenticity and transparency can add critical information to knowledge building. If it is done well, it can increase communicative efficiency over the long run. The magic of collective intentionality will manifest to the extent that participants find the subtle balance between rigor and care, challenge and support (or, from Murray, 2006c, integrity and perspective-taking).

Revealing and discussing the topics of interest and concern within and among individuals (i.e., the subjective and intersubjective), and posing ideas in areas of uncertainty, opens one up to social vulnerabilities. These vulnerabilities must be compensated for by the level of trust, integrity, and reciprocity in the dialog space. There are two implications of this trust/vulnerability dialectic: (a) we acknowledge that each individual needs to decide what feels appropriate and safe to communicate, and when to apply any of the guidelines; and (b) the more that participants apply the guidelines (perhaps "courageously"), the more safety, trust, and integrity is created in the dialog space. The level of reciprocity attained, and the degree to which participants own their biases, feelings, cognitive filters, etc., will depend in part on developmental elements of each individual and in part on evolving culture of the group (Ross, 2005).

Thus, the best ways to contribute to the upward evolution of a dialog (and the knowledge it can build) are to: (a) model the Guidelines, (b) gently offer feedback to others to help them understand and apply the guidelines, (c) avoid condemning others who do not follow the guidelines as you interpret them, and (d) help us and the group improve the guidelines. Our hypothesis is that if a group self-selects through a belief that these guidelines are valuable, and if participants agree to make a good faith effort to work within the spirit (not the letter) of the guidelines, then subsequent dialog will benefit.

Parts of Speech

These purposes are advanced through certain types of dialog patterns, or parts of speech (Ross, 2006; Torbert & Associates, 2004). Ideally, they include the following (examples of these appear in the example statements above):

- *Advocating* for a position, perspective, action, etc. (includes first-person feelings, thoughts, concerns, etc.).
- *Illustrating* the worth of whatever is advocated for, using examples (hypothetical or real) to show why the proposal is sensible (includes third-person comparisons, “objective” information, reasonable speculation with reasons given, etc.).
- *Framing,* or *re-framing*, statements in first-person terms to own and claim one's intentions, hopes, etc.

- *Inquiring* into others reactions to what one has said, or inquiring more deeply about what they have said (invites second-person, intersubjective knowledge sharing).

The first two are encountered more often than the last two. The full range of variety—which engages all three "persons" required in integral dialog—is what we hope to encourage. Thus, our guidelines explicitly support the following modes of interaction and inquiry (explained in the next section): self-reflexivity, using affect (i.e., emotional experience) as feedback, authenticity/sincerity/transparency, multi-self perspectives, we-reflexivity, ideal role taking, contradictory perspectives, synthesis/transcending and including/metasystematic perspectives, balancing critique with appreciation and inquiry, and methodology reflection.

Open Forum Guidelines and Integral Dialog Guidelines

Our Guidelines are in two parts. First are *Open Forum Guidelines*, which are basic rules of the road for participants in all *Integral Review* online forums. Second are *Integral Dialog Guidelines* which more deeply support breadth, depth, and integration in knowledge building. We expect to host at least two types of dialogs: dialogs open to anyone, and more structured dialogs with limits on participation. All dialogs would be expected to use the Open Forum Guidelines, and structured or invited dialogs would be asked to also use the Integral Dialog Guidelines (or some variation on them tailored for the situation). One type of structured dialog involves inviting a small number of respected individuals to respond to a paper and dialog with the author (perhaps followed by an open dialog after the official closing of the structured dialog). Another type of structured dialog is to collect a small group of people who agree to more stringent rules of engagement, perhaps responding to a series of prepared questions or engaging in a sequence of divergent and convergent dialog phases.

How can you participate? With each *Integral Review* issue, and occasionally between issues, we will announce which articles (or topics) will have associated dialogs and will describe the guidelines for each dialog. Open dialogs may begin immediately, and anyone can post in their forums. Structured dialogs will usually have limited participation, will begin after leaving enough time for participants to read the article (usually several weeks), and will end after a pre-determined duration (usually 3-6 weeks). Some structured dialogs will have invited participants already chosen at the time of publication. For other structured dialogs we will ask readers to submit requests to participate (along with a little information about themselves) and will create one or more size-limited groups from the set of interested readers. A minimum requirement for non-invited participation is to be a member of the *Integral Review* e-mail announcements list (sign up on http://integral-review.org).

The *Open Forum Guidelines* are straightforward, and are included in the Appendix. Below we describe the *Integral Dialog Guidelines* in two parts. First are concrete "structure and form" suggestions. Second are "attitudes and perspectives" that are meant to set the tone of the dialogs, invite certain types of exchanges, and serve as a reference for meta-dialog aimed to self-correct dialog in process.

Integral Dialog Guidelines-1: Structure and Form of Posts

*Label paragraphs***:** (sequentially through the article/post, e.g., "1, 2, 3"; or hierarchically showing sections; e.g., "3.1.5"). This will help others refer to specific claims or ideas.

Use dialog labels: When useful, we suggest labeling statements or paragraphs with labels such as the ones suggested below, in CAPital letters in front of your statements or paragraphs:

> "FACT:" (or "INFO:"), "OPINION:" (or "HYPOTHESIS:"), "QUESTION:" (or "REQUEST") (to balance advocacy with inquiry and curiosity)

Other possible labels include: SUGGESTION (for how to proceed with dialog or other actions), APPRECIATION (to balance critique with acknowledgement), PROCESS (to discuss the process or tone of the dialog), ASSUMPTION (to identify your underlying beliefs or values), CHAT (to identify tangential posts such as "I second that idea" and "glad to see you here on this forum").

See the guidelines below for more ideas on models for labeling.

Integral Dialog Guidelines-2: Attitudes and Perspectives

Self-Reflexivity (and metacognition). Critically examine one's own values, assumptions, biases, and interests. Reflect on biases that may arise from culture, gender, power-dynamics, etc. (As appropriate, be transparent about these, see transparency below.)

Affect as feedback. Strong reactions, favorable or critical, to another's idea or style are invitations to look inward (with what David Bohm would call "proprioception of thought") and be alert to bias, projection, black-and-white thinking, and other contractions of thought. This is not to advise against vigorous language or strong claims, but a reminder that emotional states may contain important information about conscious or unconscious needs, values, or goals. Discovering the psycho-logic of our projected emotions can lead to self-knowledge-building. We do not suggest that it is always productive to communicate to others what one discovers in such introspection, but propose that it is worth paying attention to.

Authenticity/sincerity/transparency. Make a sincere effort to make known all information that could be relevant to the particular problem under consideration. This might include:

- One's true intentions, interests, needs, feelings, and desires.
- Relationship to the topic (experiences and level of expertise).
- Relationship to the author or participant one is commenting on.

Multi-self perspectives. Individuals are not usually "of one voice." One can explore contradictory internal beliefs; take up opposite sides of an issue; speak from multiple inner voices (e.g., the voice of compassion, the inner defender, the skeptic, the vulnerable child, the voice of higher awareness, etc. See Voice Dialog, and Big Mind Process at www.bigmind.org). One can speak from one's levels of needs/values from the Spiral Dynamics model, e.g., the purple, red, blue, orange, green, and yellow perspectives that arise within one. One can speak from the perspective of one's role, e.g., “in my leadership role as project manager I think… but as a parent of teens I think...and as your friend I think…"

We-reflexivity (and meta-dialog). It may be important to reflect on group relationships and process, to make "points of order," reflect on the quality of the dialog, or discuss the usefulness or meaning of these guidelines.

Ideal role taking. Attempt to understand the argument from the other's perspective. This usually requires a commitment to iterations of dialogue and learning. Making direct inquiries is recommendable, and spares guessing at another’s position. Usually, people welcome opportunities to explain what they mean. This process may require putting one's world view and cherished ideas aside (suspending) to try to enter into the world of the other (or open to a larger space of possibility). This hypothetical role taking can be of participants, or of various stakeholder groups.

Contradictory perspectives. Allow for paradox, ambiguity, and contradictory ideas, and attempt to look for and articulate the questions underneath.

Synthesizing/transcending and including/metasystematic perspectives. Is there a perspective from which the perspectives or "truths" on the table are all true in their own way? Does the complexity of the subject matter indicate that each may be appropriate or necessary in certain contexts (i.e., one size does not fit all)? Have all valid concerns been integrated into a conclusion (i.e., is the conclusion nuanced enough to be adequate)? What are the strengths, weaknesses, and differences among the various paradigms, theories, or worldviews converging in the conversation?

Balance critique with appreciation and inquiry. The cultivation of openness, contemplative "letting go, letting be, and letting come" can, without losing rigor, allow critique to turn into curiosity. Dialog can build upon the strengths in another's position as well as capitalize on the weaknesses in another's position.

Methodology reflection. There is no single or fixed set of criteria for evaluating claims or assertions. People judge the validity of each other's claims differently for different situations. (See methodological pluralism [Wilber, 2006], metaphorical pluralism [Lakoff & Johnson, 1999], and epistemic indeterminacy [Murray, 2006a].) The point is to try to differentiate and be explicit about how we make these judgments (i.e., distinguish various truth/validity/meaning-generating methodologies or criteria). There are many possible frameworks for these differentiations, including:

- Various truth-validating criteria, including: correspondence with objective reality; coherence with other things that are believed; the consensus of experts or group members; practical utility; the authority, legitimacy, or reliability of antecedent information sources. etc.
- From Habermas' validity claims framework: Is your critique about another's claim about its: comprehensibility, truth, moral or normative rightness/appropriateness, or the sincerity/honesty of the author?
- Wilber's information sources of "eye of matter, eye of mind, or eye of spirit;" or his 8 primordial perspectives and methodologies (including phenomenology, hermeneutics, structuralism, and empiricism).

Note that these guidelines are meant to be applied alongside (or over and above) more standard knowledge building values. We do not discuss them here, but precision, rigor, clarity, efficiency, accuracy, logic, and objectivity remain important to productive textual dialog. These more traditional values can be at odds with those implied above (and at odds with each other) and finding a combination parsimonious to each context is a matter of art and wisdom. (In Spiral Dynamics parlance one could say that we are supporting second tier methods of knowledge building, which must by definition transcend *and include* first tier methods.)

Conclusion

In the *Integral Review* forums, we assume that dialog has three primary purposes:

1. *Knowledge building*, i.e., the collective attempt to discover or create ever more adequate knowledge.
2. *Building social capital*, i.e., the community building and networking that occurs as people interact, get to know each other and accomplish something together.
3. *Deepening spiritual or transformational capital*, i.e., in the ways that one grows and develops from interactions with others with different perspectives than one's own, engaging in self-reflection and adaptation.

Online collaborative tools can support both the external behaviors and the internal skills that are needed for integral knowledge building, social capital building, and personal transformation (Murray, 2006c). Such tools and their associated protocols are not guaranteed to benefit every individual, but across a group of individuals a system of small interventions should create a noticeable change on average and over time.

There is a dialectic or reciprocal relationship between human technological artifacts and human development (see Collins, Shukla, & Redmiles, 2000; Vygotsky, 1978); indeed, in all of our human activity (Ross, 2005). The technologies that we create, and the activities we undertake, alter the environment that we operate within and end up creating us as much as we create them. This dialectic occurs mostly inadvertently (we create technologies and undertake activities to solve problems and meet needs, not to change ourselves) but it need not be unconscious. Digital technologies afford unique opportunities to consciously tailor the medium/environment of communication to support evolutionary processes. When imposed hierarchically such tailoring can seem like social engineering, but when created collaboratively it can be empowering and transformative. This is the “opportunity space” we hope to open up with *Integral Review* dialog forums.

Appendix—Open Forum Guidelines

1. *Use real identities*. All participants are asked to use their real names, no anonymous posts or pseudonyms, please. Include contact information (email and/or home page) in posts.

2. *Be respectful*. Maintain a safe container for the expression of views and the emergence of creative collaboration.

- No attacks or threats. Avoid rumors. Respect those with differing views.
- Respond respectfully to suggestions from designated online facilitators/moderators.

3. *Stay on topic*. Help the forum stay focused and easy to follow.

- No advertising.
- Keep to the focus of the forum in general and the topic specifically.
- (Brief mention or links to of-topic items allowed in the context of on-topic conversations).
- Try to be brief and to the point--or at least *include a summary* of your points at the top of your post.

4. *Cite sources* for facts, e.g., reference books, newspapers, web sites, etc.

5. *Be curious, creative, and open to change.*

- Seek to understand other peoples' perspectives, visions, and needs. Focus on underlying needs rather than specific strategies.
- Be open to the possibility that the experiences of others may transform your opinion.
- Creatively explore strategies that meet as many needs as possible.
- Don't just critique, offer positive alternatives.

6. *Notice, question, and clarify assumptions*. Reflect on possible biases you may have. Help others clarify theirs.

7. Differentiate *facts*/information from *opinions*/ideas/values/needs. Diverse opinions, ideas, and needs are natural and encouraged, but try to identify "facts" that all can agree upon.

Tomorrow’s Sunrise – A Plea for the Future
You, Me and We

Barbara Nussbaum

Written in Santa Barbara,
Near the Brown Pelican Restaurant, Cliff Road
Inspired by Thich Nhat Hanh
Dedicated to Timothy Conway, spiritual teacher

I am the beach open and receptive
Hearing the waves, seeing the birds, enjoying the dogs,
Taking in the rhythm and energy of all I see and feel

We are the excited crests of the sea's waves
Crashing with surprised delight, Unfolding
Releasing life’s exuberant flow gently on the beach

I am the solitary resilient tree trunk
Washed ashore with no roots,
No leaves, no branches and no fruits

We are the confident sea gulls
Flying high with graceful certainty and Joy
Soaring, at times, darting down sometimes, with no clear focus

I am the cluttered pile of debris
Resting on the beach with no obvious pattern
Random wooden shapes that may please the aesthetic eye of a beachcomber

We are the dogs romping freely, flirting
With the waves’ white froth, and delighting
In our repeated forays in and out of the ocean

I am the husky puppy on a leash
Reluctantly being pulled by the owner
Wanting to go home before I am ready to leave

We are the Javanese poodles at the beach restaurant
Enjoying the prawns fed to us by our owner
Oblivious to what other dogs may or may not be eating - elsewhere

SOME RIGHTS RESERVED

I am the solitary person with my dogs
Delighting in the comfort and joy they bring me
Sometimes wishing that I had a real human being for a companion

We are the carefree 10 year old girls, wearing yellow helmets
Riding scooters on the pavement for fun
Unaware of other children walking five miles to school in Africa

I am the pure sound of the ocean
Loud, passionate and clear
Simply enjoying the way life is

We are the surfers, braving the waves
Sometimes standing, perfectly balanced on the board
Sometimes falling and laughing - ready to try again

I am the gentle wind, carrying the scent
Of the fresh salty seas,
Cooling the faces of the beach's visitors

We are the collective power of the waves
The serene silence of the sea, the tide gently reaching out
To mother earth and each other

I am the sun, shining with full brilliance
Illuminating the ocean in moving diamond shapes
Bringing warmth and radiance to all

We are the devoured prawns,
The unconscious dogs, the well intentioned beach visitors
We are Santa Barbara’s children

We are Africa’s children
Embracing the sun’s gentle light reflected on the ocean at sunset
Hoping that tomorrow’s sunrise, brings compassion to the world.

Barbara Nussbaum *is a writer and currently works at CIDA City Campus in Johnnesburg, South Africa, where she teaches in a masters programme on Social and Economic Transformation. She is passionate about ubuntu, which is a South African indigenous word for our common humanity. Her writings about ubuntu can be accessed on her website: www.barbaranussbaum.com.*

Four Days in France[1]: An Integral Interlude

Tam Lundy

A Call to Home

When the invitation came, I knew I had to go. A professional gathering on international development, sponsored by Integral University (IU). Like the theory that informed it, the event was itself a bit of a groundbreaker, the first that IU has offered. And so I went, to meet others who are cheerfully greeting the challenge to apply integral theory in practical ways.

Four days in the south of France. In Perpignan, a medieval city on the edge of the Pyrenees. Mediterranean air and ambiance. Palm trees and pink marble sidewalks. The crossroads of French and Catalan cuisine. A traveler's dream. But I was there for the talk. Integral talk.

In Canada, I work in British Columbia (BC) with BC Healthy Communities, a province-wide initiative whose mission is to foster health, well-being and healthy development in communities throughout British Columbia. Over the past year, in my role as Education and Development Coordinator, I have introduced the integral model as a helpful framework to guide our thinking and our practice. And, while community development practitioners and policy makers alike have expressed interest and resonance, there is still much to learn about its practical application. Since this work can be lonely at times the opportunity to talk to colleagues was like a call to home.

And so, in pink and palm treed Perpignan, I spent four days in an integral huddle. My companions and I explored and expanded theory, shared problems and potentials, invited insights into the projects we're involved with, and pushed the edges of our own thinking and practice. As happens when misfits come together, community was quick to coalesce. And the rudiments of an international network took root. It was a good beginning.

The Incredible Thickness of Theory: A Celebration

Integral seminars typically begin with a "theory day"—an opportunity for participants to revisit and review the theoretical foundations of Ken Wilber's integral framework. Recently, Ken's work has itself evolved, from that body of work that has come to be known as "Wilber-4" to the newer material that has emerged with the writing of Integral Spirituality, now acknowledged as "Wilber-5."

Wilber-4, of course, laid the theoretical foundations known as AQAL: all quadrants, all levels, all lines, all states, and all types. Framed by four quadrants, AQAL posits four basic perspectives: interior, exterior, individual and collective. Wilber-5 goes further. While preserving the four native perspectives from which we view the world and experience reality arising (UL, LL, UR, LR), Wilber-5 expands the AQAL map to include eight basic perceptions, or zones. Each zone guides inquiry into the *inside* and *outside* view of the phenomena arising in each quadrant. Participants observed that, weaving together research methods that effectively address

---

[1] "A Charette for Dialogue, Innovation, and Visioning" Integral International Development Centre, Integral University. October 15 – 18, 2006. Perpignan, France

SOME RIGHTS RESERVED

each zone, integral methodological pluralism becomes the paradigmatic foundation from which a truly integral inquiry can proceed.

Next, we leapt into discussion of other important theoretical contributions of Wilber-5. We explored “altitude,” a holarchic measure that describes stage attainment in *all* lines of development. From there we investigated the notion of a “Kosmic address:” the location in the AQAL matrix from which phenomena arise (for example, attitudes, behaviours, social structures, worldviews). The concept of a Kosmic address helps to shine light on the notion that fundamental realities exist independent of co-created social and cultural contexts, making the “myth of the given” harder to uphold. We also reviewed the Wilber-Combs Lattice, clarifying that transpersonal *states* of consciousness can be experienced at any *stage* of development, and that state experiences will be interpreted according to the stage from which they were experienced. This, of course, adds depth to the way we interpret our everyday experiences, even while it expands perspectives on the concept of enlightenment.

We also took some time to explore a topic that continues to confuse and perplex: the relationship between individual and social holons. Examined closely, say some, social holons cannot really be classified as holons at all. As Fred Kofman explains, to qualify as a holon an entity must possess an interior dimension and an exterior dimension, each arising in cultural and systemic contexts.[2] In other words, a holon possesses sentience. We noted that, while individuals possess sentience, a group does not. Rather, while a group or society—as an aggregate of individuals (or holons)—possesses intention and will, these agentic qualities cannot be assigned to the group itself. Groups and societies possess a dominant discourse, not a dominant monad. A clear understanding of the relationships and dynamics among individual and social holons is particularly important for practitioners whose work is centered in the realm of culture (LL) and social systems and structures (LR). We concluded that additional work, both theory building and practice-shaping, is needed in this area.

Integral in Action: Stories from the Edge

This headlong dive into theory helped to frame the discussion that unfolded over the next few days. Our stories drew on a broad range of educational and professional experiences, as economists, lawyers, engineers, geographers, historians, university professors, and as consultants in such diverse fields as international development, business, sustainability, community development, and resource management. Our organizational affiliations were equally diverse, including the World Bank, UNDP, the Inter-American Development Bank, universities, the private sector, various levels of government, and a variety of international and domestic NGO’s. And while our native and learned languages included English, French, Vietnamese, Spanish, Turkish, Estonian, Dutch, German, Russian, Finnish and Kiswahili, there was another language that united us: integral.

Amidst such diversity, it was shared language and concepts that helped us to see patterns amongst the myriad of ways that practitioners are using the integral model in their work-in-the-world. We learned about initiatives that are applying the integral framework in community building initiatives on many continents; these stories took us as far afield as Scotland, Georgia, South Africa, Ethiopia, Nigeria, Bolivia, Venezuela, El Salvador and Canada. And further.

---

[2] Kofman, Fred. “Holons, Heaps and Artifacts.” Available at: http://www.integralworld.net.kofman.html

We heard about initiatives that are creating integral knowledge networks, mapping indicators of sustainability and well-being, promoting ethical leadership, building healthy community, teaching sustainable development, managing large-scale economic development projects, and addressing trauma in post-war societies. But while the contexts differ, our stories had a common theme: the promise and potential that an integral perspective brings to the global need for positive change.

Inviting Inquiry and Insight

This promise and potential for positive change was explored further as we broke into small conversation groups. A modified World Café format gave us an opportunity to deepen our dialogue and apply our shared knowledge and experience to emergent and urgent global challenges. Small groups addressed a range of topics arising in earlier discussion: promoting healthy human development, integral responses to HIV/AIDS, leadership in African contexts, and the question of self-other boundaries (no boundary?) in international development work. Conversations were far reaching, seeking practical responses to perplexing problems, as well as the roots of those problems and the dynamics at play within complex issues.

We began to notice certain threads of inquiry that popped up throughout our time together. For those who introduce integral approaches to others, a common question relates to the wisdom of presenting the complete integral framework (AQAL), or a more subtle approach—focusing on quadrants, for example—an approach affectionately known as “integral lite.” And when is it appropriate to invite integral exploration without using the term at all?

Another thread of inquiry led to the observation that in development work, as in most other disciplines, the primary emphasis is on *doing*. In a modern professional landscape, it is our doing that is measured, and it is our doing that is rewarded. But integral theory reminds us of the importance of *being*. And of *becoming*. Seen through an integral lens, our actions are intimately related to our own developmental achievements and the evolving perspectives that they engender, including our perspectives on the relationship between self and other. For instance, developmental activity will look different when it is informed by a sociocentric perspective than it will when it is carried out from a worldcentric perspective. And healthy sociocentric perspectives are necessary foundations for an eventual shift to healthy worldcentric perspectives. Therefore, effective and sustainable development work will pay attention to human development—to being and becoming—not only in the people and communities we work with, but in ourselves as practitioners. Most importantly, perhaps, our developmental attentiveness will be most effective when it includes personal and collective shadow work. Hmmm.

Random Reflections

Our four days have come to a close. We share final thoughts, pose for pictures, and make plans to meet again. Istanbul next year? Yes!

What do I bring home with me? First of all, an awareness that the work I do has a lot in common with the work of my colleagues in other parts of the world. Like Adriana in El Salvador, Yene in Ethiopia, and Will in Australia, my work fosters health, well-being, and healthy development in people, in communities, in regions, in countries. Like Nick in Scotland, William in Canada, and Paul in Egypt, my work attempts to address *all* of the factors that influence health, well-being and healthy development: social, economic, environmental, physical, psychological, spiritual and cultural. Responding to the realities emerging in different corners of the globe, the details might look different but the work is the same. And with an integral map to guide this work, with integral concepts and language to deepen the discourse, the inquiry will continue and the insights will grow.

I also bring home a renewed commitment to use integral language and concepts in my development work in Canada. Some important foundations have already been laid. For example, BC Healthy Communities has adopted an integral capacity building approach, one that addresses the whole person within the whole community. As our website[3] explains, “an integral lens helps us to see important interconnections among people, organizations, and sectors. An integral lens also helps us explore the complex relationship between human activity and the environment. And it helps us to address the interconnections among the multiple determinants of health, well-being and healthy development.

An integral approach to capacity building recognizes that community has four dimensions: individual and collective, interior and exterior. Our Integral Capacity Building Framework and the Integral Map of Community work hand-in-hand, stressing the importance of paying attention to each of these dimensions. With an integral approach, we can unify what is often a fragmented approach to community building, making a bigger difference, a more sustainable difference.

While communities are becoming increasingly aware of the complexity of the issues that they must address, they are less certain how to address that complexity. The integral framework offers a simple yet comprehensive logic model to guide planning, policy making, practice and evaluation. As Albert Einstein so famously said, “we can’t solve our problems at the same level of thinking with which we created them.” The integral model can assist communities to take their thinking and actions to the next level.

Finally, I came away with the insight that integral is only as good as we make it. While it remains a theory, it lives in our heads. When it becomes embedded in our day-to-day practice, it lives in our hearts and hands. Engaging head, heart and hands with integral intention will go a long way toward taking community development work to the next level of thinking and action.

This is our potential. And it is also our learning edge. With the integral framework as both a research and practice paradigm, we will make small experiments, strategic forays into less familiar territory. With the integral framework as a guide, we will make learning and action parallel priorities. We will examine community change contexts in all their complexity, engage dual powers of critical thinking and inner reflection, dig into our deepest wisdom, step back a little to allow next steps reveal themselves. Then, with renewed insight and intention, take brave actions in the direction of our dreams.

Tam Lundy, PhD*, is a consultant, educator, and mentor in the field of human and social development. She has worked extensively with communities and with government, offering leadership and support in capacity building, community consultation and engagement, team and network development, and in planning and evaluation. Tam brings an integral thinking and practice approach to her work as Education and Development Coordinator at BC Healthy Communities. Integrally-informed resources adopted by BCHC include Tam’s* Integral Capacity Building Framework *and* Integral Map of Community*; they can be viewed at* *www.bchealthycommunities.ca*.

Rationale for an Integral Theory of Everything[1]

Ervin Laszlo

There are many ways of comprehending the world: through personal insight, mystical intuition, art, and poetry, as well as the belief systems of the world's religions. Of the many ways available to us, there is one that is particularly deserving of attention, for it is based on repeatable experience, follows a rigorous method, and is subject to ongoing criticism and assessment. It is the way of science.

Science, as a popular newspaper column tells us, matters. It matters not only because it is a source of the new technologies that are shaping our lives and everything around us, but also because it suggests a trustworthy way of looking at the world—and at ourselves in the world.

But looking at the world through the prism of modern science has not been a simple matter. Until recently, science gave a fragmented picture of the world, conveyed through seemingly independent disciplinary compartments. Even scientists have found it difficult to tell what connects the physical universe to the living world, the living world to the world of society, and the world of society to the domains of mind and culture. This is now changing; ever more scientists are searching for a more integrated, more unitary world picture. This is true especially of physicists, who are intensely at work creating "grand unified theories" and "super-grand unified theories." These GUTs and super-GUTs relate together the fundamental fields and forces of nature in a logical and coherent theoretical scheme, suggesting that they had common origins.

A particularly ambitious endeavor has surfaced in quantum physics in recent years: the attempt to create a theory of everything—a "TOE." This project is based on string and superstring theories (so called because in these theories elementary particles are viewed as vibrating filaments or strings), and it uses sophisticated mathematics and multidimensional spaces to produce a single equation that could account for all the laws of the universe. However, the TOEs of string theorists are not the definitive answer to the quest for a unitary world picture, for they are not really theories of *every*-thing—they are at best theories of every *physical*-thing. A genuine TOE would include more than the mathematical formulas that give a unified expression to the phenomena studied in this branch of quantum physics; there is more to the universe than vibrating strings and related quantum events. Life, mind, and culture are part of the world's reality, and a genuine theory of everything would take them into account as well.

Ken Wilber, who wrote a book with the title *A Theory of Everything*, agrees: he speaks of the "integral vision" conveyed by a genuine TOE. However, he does not offer such a theory; he mainly discusses what it would be like, describing it in reference to the evolution of culture and consciousness—and to his own theories. An actual, science-based integral theory of everything is yet to be created.

A genuine TOE *can* be created. Although it is beyond the string and superstring theories in the framework of which physicists attempt to formulate their own super-theory, it is well within the scope of science itself. Indeed, the enterprise of creating a genuine TOE is simpler than the attempt to create a physical TOE. Physical TOEs endeavor to relate together all the laws of

---

SOME RIGHTS RESERVED

physics in a single formula—laws that govern interactions among particles and atoms, stars and galaxies: many already complex entities with complex interrelations. It is simpler, and more sensible, to look for the basic laws and processes that *give rise to* these entities, and to their interrelations.

The computer simulation of complex structures demonstrates that complexity is generated, and can be explained by, basic and relatively simple starting conditions. As John von Neumann's cellular automata theory has shown, it is enough to identify the basic constituents of a system and give the rules—the algorithms that govern their behavior. A finite and surprisingly simple set of constituents governed by a small set of algorithms can generate great and seemingly unmanageable complexity merely by allowing the process to unfold in time. A set of rules informing a set of constituents initiates a process that orders and organizes the constituents in time, so that they create more and more complex structures and interrelations.

An integral TOE identifies the constituents of "every-*thing*" and states the rules by which the constituents relate to each other so as to form ever more complex things. It identifies the most basic kind of things that exists; the things that generate other things without being generated by them. Then it states the simplest possible set of rules—algorithms—that explain the emergence of the kind of things we have reason to believe exist. If it succeeds, it will be capable of explaining the origins of every-*thing* in the real world, together with the kind of relations that prevail among them. By extrapolating into the future, it will also be able to explain the kind of developments that are likely to occur: how the existing things transform their relations to each other in time, and transform themselves in the process.

The new physics gives us the basis on which this ambitious enterprise can be attempted. Using the findings of cutting-edge particle and field theories, we can identify the foundation out of which all things are generated without itself being generated by other things. This foundation is the virtual-energy sea known by the name of *quantum vacuum*. We can also draw on a large repertory of laws that tell us how the primary constituents of reality—the particles known as quanta—are generated in, and arise out of, this cosmic foundation.

The currently known laws by which the existing things of the world are generated from the cosmic vacuum are laws of interaction based on the transfer and transformation of *energy*. These laws turn out to be adequate to explain how real things—in the form of particle-antiparticle pairs—are generated in and emerge out of the quantum vacuum, but not how in the course of cosmic eons the surviving particles become structured into more and more complex things: galaxies and stars, atoms and molecules, and on suitable planetary surfaces also into macromolecules, cells, organisms, societies, ecologies, and entire biospheres. In order to account for the ongoing, if by no means smooth and linear, evolution of the existing things, we need to add an element of interaction that is additional to energy. The importance of this additional element is now recognized by more and more scientists. It is *information*—information as a real and effective factor governing evolutionary processes in all segments and domains of the known universe.

Most of us think of information as data or what a person knows. But the reach of information is deeper than this. Physical and life scientists are discovering that information extends far beyond the mind of an individual person or even all persons put together. It is an inherent aspect of both physical and biological nature. The great maverick physicist David Bohm called it "in-formation," meaning a process that actually "forms" the recipient. This is the expression we shall use here.

In-formation is not a human artifact, not something that we produce by writing, calculating, speaking, and messaging. As ancient sages knew, and as scientists are now rediscovering, in-formation is present in the real world and is a decisive factor in the evolution of the things that furnish the real world. When we recognize that “in-formation” is a real and effective factor in the universe, we obtain the basis for creating a genuine “integral TOE.”

The concept of an in-formation- and energy-imbued universe, building itself from simpler beginnings to ever-higher peaks of complexity, is thousands of years old; it has cropped up again and again in the history of thought. It merits being known not only by scientists, but by everyone. First, because it is the key to creating an integral TOE, one that, though not the final word, brings us closer to understanding the fundamental nature of all the things that exist and evolve in space and time, whether they are atoms and galaxies, or mice and men. And second, because the in-formation- and energy-imbued “in-formed universe” is a meaningful universe, and in our time of accelerating change and mounting disorientation we are much in need of a meaningful view of ourselves and of the world.

Ervin Laszlo *is Founder and President of The Club of Budapest, Founder and Director of the General Evolution Research Group, President of the Private University for Economics and Ethics of Vienna, Fellow of the World Academy of Arts and Sciences, Member of the International Academy of Philosophy of Science, Senator of the International Medici Academy, and Editor of the international periodical World Futures: The Journal of General Evolution. He is the author or co-author of forty-seven books translated into as many as twenty languages, and the editor of another thirty volumes including a four-volume encyclopedia. Laszlo has a PhD from the Sorbonne and is the recipient of four honorary PhD’s (from the United States, Canada, Finland, and Hungary). He received the Peace Prize of Japan, the Goi Award in Tokyo in 2002, and the International Mandir of Peace Prize in Assisi in 2005. He was nominated for the Nobel Peace Prize in 2004 and was re-nominated in 2005.*

Book Review

Harter, N. (2006). *Clearings in the Forest: On the Study of Leadership*. West Lafayette, IN: Purdue University Press.

I spent many years studying leadership as the focus on my graduate education, and have encountered many attempts to describe both leadership and what the study of it is about. My experience of most of that literature was usually disappointment, as authors tended to try more to answer the question than to understand its scope and context. The drive to "know" the subject, to be an "expert" in order to fulfill various motivations or needs, or even the desire to report on research and study that proved useful in certain contexts all left me with a kind of dissatisfaction that the scope of the question, the basis for knowledge, the rigor brought to bear was insufficient to the nature of the subject.

In that context, I recently read Nathan Harter's *Clearings in the Forest: On the Study of Leadership* and found myself pleased to be guided on a journey that spent far more time orienting me to the scope and nuances of this field than placing stakes in the ground to assert positions. Harter's metaphor of taking a walk in the forest, going down into its valley to explore the experience of leadership, and then ascending the slopes along well chosen paths that illuminate the meaning of leadership, helps the reader avoid being unable to see the forest for the trees.

It is this level of Harter's capacity to situate the reader in relation to the subject, both at the level of the entire book, and as he focuses on each specific topic, that brings an integral flavor to it. For instance, at the valley bottom he explores the role of image and imagination in leadership in a way that shows how it goes beyond the limitations of theoretical or symbolic approaches. Then, on the way up the slopes, he chooses a path of examining leadership as a sociological form, noting different qualities of the form, structures it can take and the conditions that it arises in. He begins with simple examples, and moves on to explore more and more complex ones. Examining this complexity, he notes:

> In other words, after taking hold of one little strand in the great ball of reality, we shall have isolated the role of imagination – a nearly transparent moment in human experience – and placed it in larger and larger contexts, by a process of synthesis, until very nearly reaching world-historical patterns of continuity and change (p. 147).

Harter's work is not superficial. He utilizes elements of pragmatism and phenomenology and digs deep into epistemological issues inherent in the study of leadership. At times the reader may wonder where he is going, if he is not lost in his own forest. But some patience and perseverance rewards the reader with a perspective that shows these elements—pragmatism and phenomenology—to be critically involved in such study. Approaches that do not take sufficient account of them are bound to lead to the kind of disappointment I alluded to earlier.

While this is not a traditional approach to examining leadership and its study, Harter does tackle some of its sticky issues, including notions of power, elites, and ethics. Near the end, he

SOME RIGHTS RESERVED

introduces a relatively obscure framework[1] for introducing the notion of verticality as a way to situate different elements of leadership. This move adds a further element of an integral approach. And the ever evolving nature of an integral approach to the topic is reflected in his closing comments about the study of leadership.

> I have decided that the ambivalence, uncertainty, and "dim perception of the future" that Thompson worries about are inherent, part of the constitution of our study, never to be resolved—at least not without distorting reality. That is my tentative position (p. 186).

Allowing Nathan Harter to be your guide on a journey through the forest of leadership studies is not for the faint of heart, or for those looking for definitive answers on key questions. It is a rigorous hike, rewarded at the top with a view that takes in the whole forest. Standing here and gazing out, I feel the kind of satisfaction that comes from having a view that integrates the breadth and depth of the landscape.

[1] You can find a description of this framework in issue #2 of *Integral Review*, in Harter's article *Voegelin's Ladder*

The Map, the Gap, and the Territory

Bonnitta Roy

Introduction

Two recent articles by Matt Rentschler posted at Integral University Presents,[1] combine to give the reader examples of how one can take up any given theme, in this case art, and codify it into an AQAL[2] framework. In the first article, *Introducing Integral Art,* Rentschler fits various art "styles" into corresponding quadrants according to the perspectives which generate the styles. In the second article, *Understanding Integral Art*, he describes how the artist can improve his/her self and art, as well as the potential of having the Muse visit more often, by simultaneously working on all lines of development. Alternately, the art critic can apply the AQAL framework and its concept of development along lines, levels, states, types, to improve his/her critical analysis of the author and the work. The overall result is a kind of AQAL primer on art. I have tried reviewing it on those terms—as a simple primer written to introduce the reader to the AQAL model.

Still, Rentschler reminds us that it is important to distinguish an AQAL map of art like the one he is presenting, from the actual territory, "art." But while these two articles demonstrate that Rentschler has a clear understanding about the categories that prescribe the AQAL model, he seems to be unable to make clear distinctions about those "other regions"—the territories—art, integral art, art interpretation, integral art interpretation. There are three major distinctions that I think are germane to his articles, namely:

1. The making of an AQAL meta-map, which requires the systematic arrangement of previous interpretations according to the AQAL model;
2. The exploration of the territory "art," which requires what I call *"gap-diving" into the territory* and reporting back;
3. The elucidation of Integral Art, which requires the "gap-diver" to explore the territory in completely new, a-perspectival ways of seeing, thinking and experiencing, and reporting back in terms of what Gebser[3] calls "a new form of statement."

The making of meta-maps

While there is a certain utility in organizing large amounts of knowledge in a generalized framework, in order to situate the reader with respect to the material, or to orient the reader with respect to the author's own perspective, there is also a great deal of over-simplification that comes with the kind of systematic generalization it requires—oftentimes reducing rich ideas and

SOME RIGHTS RESERVED

complex human endeavor to conveniently distributed categories. This is the kind of approach that produces textbook primers, like those sweeping books on art history that introduce students to the various “art-isms:” expressionism, formalism, romanticism, neo-romanticism, and the like.

Rentschler’s article demonstrates how we can re-align these convenient judgments into AQAL terms. My sense of this, however, is that by doing so we are creating, as it were, a map *twice-removed from the territory.* It seems to me more valuable to describe how those primers failed us in the first place by giving us the impression that entire realms of human endeavor can be easily codified in such convenient terms as “expressionism” or “formalism” *because* they limit their interpretation to mono-logical domains.

It also seems to me that it would be more valuable to re-examine the actual territory, and look with new eyes—eyes that are liberated from the previous modes of interpretation that by *delimiting experience into categories, also limit our experience to those categories.* Not only to reiterate the subjective (in AQAL shorthand, the upper left or UL) aspect of Expressionism, for example, but to show how even Expressionism, which is conveniently judged to be an UL enterprise, is inextricably constituted by, and inimically interweaves itself into, all the other domains. To show that the convenient but partial truth about Expressionism is “it is UL;” but the inconvenient truth about Expressionism, as with all human endeavors, is the constant confronting and testing of limits, stretching and smashing of boundaries—creating and destroying interpretations *all at once.* No art, no artist, no enterprise, no idea, no methodology is ever situated in just one quadrant—however convenient to categorize them in such a way. It seems to me that an Integral approach on Expressionist artists would be to show how the regions of their minds, their work, their culture, their world, are in constant dynamic relationship, continually testing and crossing the tentative boundaries between domains of understanding and spheres of meaning. Doing this would, I believe, help us get closer to their territory.

Gap-diving the territory

Rentschler warns us, toward the end of the second article, “The map, however, should not be mistaken for the territory; the model should never get in the way of the Muse.” The point, well taken, is that there is a gap between the map and the territory, the model and the Muse. Moreover, we *realize there is a gap.* Furthermore, for the first time in history we have the ability to create meta-systemic maps to describe the gap. However, Rentschler’s article is supposedly about art, supposedly about the territory that is art—and therein lays the confusion. These articles are not actually about art, they don’t actually *go there, into the territory*. These articles are exercises in AQAL map making.

To write authentically *about any territory,* such as “art,” one has to *go there*—to take a dive into that gap, plunging toward the territory as deep and as far as one can let oneself go. To extend the metaphor, we have to dive for as long as we can hold our breath—which is the suspension of making convenient interpretations for as long as it takes to touch bedrock. And then—and only then—are we qualified to report back. What was it like? How deep did you go? What did you discover? Did you touch the face of the Muse? “Go on,” I want to shout out to Rentschler, “dive in. Be a gap-diver!”

It is terribly difficult to be a good gap diver. For this we have the words of greater thinkers and writers, greater artists than ourselves. Here are some examples of writing from the territory:

> To be an artist, you need a teacher. And it is for this reason, above all, that I began collecting carpets. Many years ago I began to realize that carpets had an immense lesson to teach me. That as organized examples of wholeness or oneness in space, they reach levels which are only very rarely realized in buildings. I realized, in short, that the makers of carpets knew something which, if I could master it, would teach me an enormous amount about my own art.[4]

> The Chinese sage said that one must grow with the tree. I know nothing truer. … By entering into the object one comes into one's own … and in the work, I found myself.[5]

> In this way the Kimberly rock art of the past has been incorporated within an interpretive schema of the present: the Wandjina on the one hand, repainted again and again over time *becoming one with the present*.[6]

> It is possible—even probable—that a growing, evolving awareness may hold sway, and a society may come to exist in which the integrated, unified relation to the world, in which individual feeling, the form of the world, and the feelings of others, are woven together in a less and less broken whole. *There [must be]… a direct connection between the living structure of the world and the achieved person-ness we experience in ourselves.*[7]

> But sensing that nothing opposes it—supposing that there are also lines and forms as well as colors on the other innumerable planets and suns—it would remain praiseworthy of us to maintain a certain serenity with regard to the possibilities of painting under superior and changed conditions of existence, an existence changed by a phenomenon no queerer and no more surprising that the transformation of the caterpillar into a butterfly, or of the white grub into a cockchafer. The existence of painter-butterfly would have for its field of action one of the innumerable heavenly bodies, which would perhaps be no more inaccessible to us, after death, than the black dots which symbolize towns and villages on geographical maps are in our terrestrial existence.[8]

> Nature is not at the surface but in the depths, and colors are expression of this depth at the surface; they surge up from the roots of the world.[9]

Or we might look to traditions like Japanese calligraphy, where the ink, the painter, the painting, the environment, the past and the present pivot on the here and now, gathering in a field of opening in a moment of ripeness.

Integral Art

In his seminal work *The Ever Present Origin,* Jean Gebser points out a critical distinction between the Rational Level tendency to codify perspectives, that is to arrange any number of perspectives according to their relations in systematic terms (aka, making maps) and the Integral Level which goes beyond the mapping of perspectives, beyond even the making of perspectives, into thinking and experiencing in *a-perspectival ways*. This is a difficult idea to come to terms with if one has already relegated (in one's mind, through various exercises) all of the territory to a map of perspectives. If we have trained ourselves to see everything and everywhere through AQAL eyes, how can we understand the meaning of a-perspectival, or ever come to accepting such a possibility of a-perspectival thinking and experience? The significant question I have then, is how do we get from where we are, to *Integral*; from AQAL to A-perspectival? According to Gebser, we need a new form of statement:

> If we do not decide to risk "upsetting" some persons and things, and indicate the inadequacy of systems with their categorical rigidities, we will not be able to approach the new world reality. … [There] is a clear indication that the qualities of time which are today pressing toward awareness cannot be expressed in mere categorical systems. …We are compelled, in other words, to find a new form of statement.[10]

As Integral writers, we need to be experimenting with new forms of statement. As integral thinkers, we need to go beyond the very horizons of thought and experience we have just recently come to define. Here is where Integral Art comes into play. Every age has their artists to forge the way into the next, to pierce through all our convenient truths into uncharted territory. We need only to be open to what they have to show and tell, despite the dissonance in us it might create, and in spite of all of what we know.

Andrew Campbell

The Dance Integral

Picasso wrote that there is no abstract art.

> You just always start with something. Afterwards you can remove all traces of reality. There is no danger there anyway, because the idea of the object will have left an indelible mark. It was what started the artist off, excited his ideas, and stirred up his emotions. When I paint a picture I am not concerned with the fact that two people may be represented in it. Those two people once existed for me but they exist no longer. My vision of them gave me a little emotion, then little by little they became for me a fiction, and then they disappeared altogether, or rather they were transformed into all kinds of problems, so that they became for me no longer two people but forms and colours - forms and colours which nevertheless resume an experience of two people and preserve the vibration of their life (1972, p. 64).

In the Rich Vibrating Ground

In 1998 I facilitated a three day programme with a group of people; among them was the wife of a wealthy property developer. To give an idea, in 2003-4 he paid himself a salary of 22 million pounds sterling. This young and beautiful woman came up to me in a session break, just prior to my workshop. She briefly explained that she had trained at art school, but had since lost her creativity, despite having a wonderful studio in London. She was, she said, facing the prospect of 'painting' with some dread and anxiety.

I told her about my first teacher, Leonard McComb RA who had, at the age of fifty, destroyed a lifetime's work, describing it as 'frozen.' He then had a moment of metanoia, while 'copying' a small JMW Turner in the National Gallery, a study of 'Mackerel' - seeing, for the first time the way that he had 'captured light' through placing tiny speckles of 'china white' into the translucent ground. His images then 'grew' over a period of years from these small, strangely-incredibly lighted applications of watercolour to ground—sometimes making subjects appear as ephemeral ghosts, transparent. Often he would flick random paint onto the surface, as he worked. The paradox was that they became more stilled, more monumental within the disturbances. So, I suggested she take the water and the paper and *paint with no colour,* since this would have a liberating effect in several directions. I spoke about the way that the water would bring the paper (dead tree fibres) back to life, and it would buckle as if in memory of its own water born life ;-). Liveness essentiality . . . becoming-being. As the conversation progressed, I shared with her that I had no children, and that I had a dog, called Bucket. And that Bucket would curl up and sleep with me, nestling as if he were a child in a womb.

During my workshop on that occasion, I told her and the 30 or so others in the hall about my life and work and learning, about agape as unconditional love (Agape) which I'd come to see as unconditional collapse, which releases free energy. The day passed. I didn’t follow her progress through the session and I never saw her outputs.

Two years later I was invited to attend another group workshop, but not to facilitate, at the same venue. The large manorial barn was already full, and they were about to be addressed by a Benedictine monk. I took a chair, right at the far end of the barn at the back. A man stood up. It was the woman’s husband.

“I would like to point out that man, the one sitting over there. He worked with my wife and me a few years ago, here.” “(Andrew) I would like you to know that my wife has since had a child, and we have given her a middle name, stemming from what you taught us that day, about *love*, her name is Agape.”

I don’t recall that I spoke to the couple during those whole two days either. Shortly after this I broke my association with the consulting group, who had convened the sessions.

In general, I understand all these events as examples of a ‘creative collapse.’ These in turn release tiny quanta of ‘free-energy.’ The trick, I have found, is to follow the ‘free energy’ back to the ground ;-).

In the Poor Vibrating Ground

Recently I shared an intimate conversation with an Integral scholar and practitioner. It involved complex dynamical properties, implied above, but the deepness of the nature of it precludes the kind of narrative given already. Therefore, I will, as Rosch implies it, *slip it to the reader sideways.*

Recently I was in the home of a client who lives, as they say, on the other side of the track. Her life is one of unremitting difficulty, boredom and background intimidation.

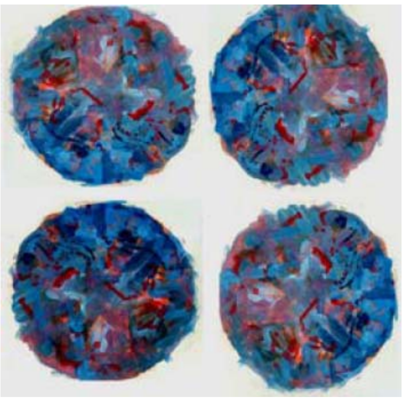
She has noble aspirations, to become a scientist, but she lacks the most basic education, she is saddled with a partner who never works, his friends regularly invade her home where they live on minimal ‘state benefits’ and the life she lives is one of ‘confusion.’ She has two children, a daughter of about three and a son of eight months.

While we were simply *waiting* one day, I was on the floor, playing with the daughter, who was building forms with long coloured lines, the kind that molecular scientists make models of atomic structures from. But it was the child’s development toy. I could see she was deeply involved.

Suddenly, in and out of my peripheral vision, the eight month old began to approach. He was on all fours. Then, his tiny warm hand reached out, and touched me.

It was a shockingly gentle moment, because it became a continuum—just as *a snowflake slides upon its own melting*—he rose up, using me as his ladder, until after just a *little time* he was standing there, just under my face. His face was purest pink—no other word conveys the palpable aliveness. His hair was yellow and his eyes sky blue. Our eyes met and, somehow, his very soul entered. It was as if a Buddha has come to sit beside me, a large mountain beside a tiny one; a large hill next to a small hill.

In this moment I realised that I had ‘suffered’ a Metanoiaical moment. A deeply spiritual happening. The small mountain was the large one and the large one the small—an impossible exchange had taken place. Though the purpose is still unresolved, in the image placed here is a partial resolution.



Gently, Gently, Gently, Four Angels

> I want to paint men and women with that something of the eternal which the halo used to symbolize. Ah! Portraiture with the thoughts, the soul of the model in it, which is what I think, must come. So I am always between two currents of thought . . . to express hope by some star, and the eagerness of a soul by a sunset radiance. Vincent van Gogh (Hammacher & Hammacher, 1982, p. 163).

Anton Ehrenzweig (*The Hidden Order of Art,* 1967) wrote, “the artist when working could produce works and internal states of extreme ‘de-differentiation’” (Glover, 2005). That’s an important word with an equally important meaning for us. De-differentiation is an *all embracing way of looking* and is used, according to Ehrenzweig, by artists to *really see* the parts of a composition as well as see the whole, simultaneously.

A state acquired like that of scattering the attention (like so many seeds of corn into the ground in a farming culture and community, a living into dying and back again in season) to such an extent that it is not even necessarily retained by our conscious memory. Our co-creative work, whatever it is—paintings, writing, compositions—seem to have ‘just happened’ and resolve themselves without conscious intervention. Such an ‘un-looking’ way as this is full of the paradoxical. It is *a new form of vision.*

It could be called paradoxically, the structure of spontaneity. Ehrenzweig considered this ‘non-linear’ (‘polyphonic’) and ‘undifferentiated scanning’ looking and working as being superior to our often over anxious, overtly self conscious and often restricting ‘linear’ ways, and especially our over-intellectual reasoning. Through this suspending (his term), by entering the undifferentiating process, people may contact, even overlap (‘nesting’ and ‘integral’ are technical terms that come to mind), with aspects of themselves that were hitherto unmet in both self and work. (The ‘appearance’ of the/any artwork, its ‘forming’ of itself, is very unimportant, even in art based workshops or retreats. It could be an arrangement of sticks, leaves or ideas.) What matters is the *opening of a new relationship,* a willingness to generate dialogue between the person and his/her deeper self—nature to Nature. Maybe it starts to resonate with those elements in the larger fields, in which he or she lives and operates, so that, Something like a true (more authentic) conversation takes place between the person and his or her own work. This 'medium,' by frustrating the purely conscious intentions you will inevitably bring to the project, allows contact with more submerged parts of his or her own personality and draws them up for contemplation. While we may struggle with (the) new medium, unknown to oneself we wrestle with the unconscious personality revealed by the work – or *work* of art. (David Bohm pointed out long ago that the basis for the word 'Art' was from the verb, *to fit*.) "Taking back from the work on a conscious level what has been projected into it on an unconscious level, (making it *fit* again) is perhaps the most fruitful and *properly painful* result of authentic creativity" (Bohm, 1998).

You and I like the parent as a creator of children, have to accept that their work has an 'independent life' and acceptance of this requires humility and perhaps a little genuine suffering. Hannah Arendt, the pupil of philosopher Martin Heidegger, recognized herself that once we have written or created something and 'let it go' out and into the world by sharing it with others, then we have to accept that we no longer control it, but that we may continue to learn from what others do with it.

> The . . . world begins by making splits, then drawing boundaries, then solidifying these boundaries. Then we fool ourselves into believing what we have made ourselves see. Solidifying boundaries is very comfortable, because it allows us to deny our experience.... We miss the whole system (Bateson, 1978, p. 44).

Some years ago I shared some imagery inspired by Francisco Varela's work, sharing my own ideas, art-work and personality is something I have learned to do in new ways since I became aware of the Internet. Caroline Hegedus (2003, personal communication) said something interesting to me about those works, as she experienced them and as someone who'd met Varela:

> "...my sense was that you 'received' the images rather than making something you 'thought' about.... (and) The fact that you did this on glass is quite intriguing to me also... when I started writing the book on John (Fetzer), I had an image of a glass book that was laying open, and that was a very important image for me as I began to write. I understood it to be about *the process* for the book."

Ehrenzweig explicitly and firmly believed that perception was implicated in both conscious and unconscious mental processes. He puts forward his main thesis that (authentic) artwork has a *hidden substructure*, which can *seem* disruptive, disordered and chaotic only to conscious perception. However, working alongside the gestalt preoccupied conscious mind is what he calls 'unconscious scanning,' where 'depth minds' perceives the hidden substructure beneath. It is this (creative) tension between an apparent surface order and the deeper structure which appears chaotic to the conscious perception, which is the essence of creative and aesthetic perception. (His work should also be read, he advised, with the same kind of 'unconscious scanning.')

I have always kept in mind since the seventies, that creativity is defined by Ehrenzweig as the 'capacity for transforming the chaotic aspect of undifferentiating into a hidden order that can be encompassed by a comprehensive (syncretistic) vision, and that 'conscious surface coherence has to be disrupted in order to bring unconscious form discipline into its own.' However, because this 'unconscious form' cannot be consciously analysed in rational terms, we must rely on our 'low level sensibility' to distinguish 'irresponsible arty-crafty gimmicks from truly creative art ruled by an inner necessity.' David Bohm (1998) said something very similar when he wrote, “For me, giving simple attention – a finer faster process than confusion – is itself the primary creative act.”

> *Imagine an infinite sea of energy* filling empty space, with waves moving around in there, occasionally coming together and producing an intense pulse. Let's say one particular ‘pulse’ comes together and expands, creating our universe of space-time and matter. But there could well be other such pulses. To us, that pulse looks like a big bang; in a greater context, it's a little ripple. Everything emerges by unfoldment from the holomovement, then enfolds back into the implicate order. I call the enfolding process "implicating," and the unfolding "explicating." This implicate and explicate *together* are a flowing, undivided wholeness. Every part of the universe is related to every other part but in different degrees. There are two experiences: One is movement in relation to other things; the other is the sense of flow. *The movement of meaning is the sense of flow* (Peat & Briggs, 1987/2006).
>
> People are essentially polyphrenic.
>
> Schizophrenia is a disease of the human condition, and polyphrenia—the orchestration of our many selves—is our extended health. We have a vast crew within that used to be called sub-personalities. But I think it has more autonomy than that, and we have to speak to 'the cook' and 'the healer' and 'the therapist' within. And 'the mechanic’ . . . And you allow them to come into the forefront, so that local ego and its limiting and habituated structures are pushed aside for the time being . . . It's *who* you bring out of the background into the foreground that makes the difference as to how you feel about things. Or, as Francis of Assisi put it, 'What we are looking for is who is looking'" (Houston, 2006).
>
> “You have taught me to look at nature, very closely” Pupil ;-) 20th Nov. 2006

A few days ago, early in a cold morning I passed by a dead tree, within the branches of which clattered a frantic dove; it rose and fell, rose and fell again, and again. Then it fell out to the ground. I picked it up and I saw its eyes were closed. It was blind. I took it to the open field and threw it into the air, but it flew straight into a tree and fell again. I picked it up a second time. I saw its eyes were still shut. I kissed each eye and each opened, I threw it into the air once more, it flew. It flew away. No miracle. I saw that its eyelids had been frozen together by the coldness.

> Since everyone is different, I cannot give one strategy that will work for everybody. For some, the contemplative path is a real path; for others, who are more kinesthetic, say, it may be a walk or a dance. . . Joseph Campbell used to tell me he got his finest ideas just editing his manuscripts, just crossing out words on yellow pads. So what I'm suggesting is that there are as many strategies as there are people. . . For me, it means getting up at five o'clock in the morning (because I'm a lark; I'm not an owl).... (Houston, 2006)

Brigg’s Reflectaphors

Briggs has worked with both Dave Peat and David Bohm. He thinks his term Reflectaphor is a ‘hinge’ of another form of a ‘hidden order’ both in art objects and also the creative process of the artist herself.

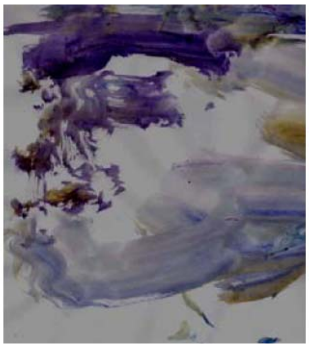
According to Briggs, Bohm stated that matter and energy continually unfold and enfold, appearing in particular (explicate) forms like photons and mountains and then disappearing into the (implicate) background. For Bohm this primordial unending movement from implicate to explicate and back again *implies* the whole. He calls it ‘holomovement’ and considers it primary to all natural law. In a metaphor, an analogous sort of thing seems to happen with meaning.

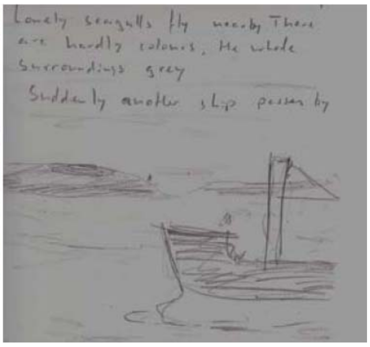
Recently one of the many subtleties of the often paradoxical movement of meaning through metaphor surfaced during a class discussion. I was explaining that I personally experienced the image as a flight of birds in formation very high up and silent, wordless. Then someone in the class pointed out that birds in flight often make quite a bit of noise, also not words, but probably communication of some sort and we realized such an image could also fit the class metaphor. Obviously, taking that angle on the metaphor alters and broadens—in Bohm's terms unfolds and enfolds—one's conception of its meaning. In the movement through the mind of the old conception and the new, one gets a taste of the whole. This suggests the metaphor is meaning as an ongoing process and perception rather than meaning as the conclusions of knowledge.

At present, neuroscience is only beginning to grapple with the immensely intricate questions of how consciousness works. But whatever the specific mechanisms, it seems plausible to generalize that a great deal of conscious processing (including layers of the unconscious and perception) relies on some form of comparison and contrast activity. These comparing and contrasting activities then refold into the background (implicate) levels of the brain to set the stage for further comparisons and contrasts.

The word metaphor comes from the Greek meta and Aryan medhi which mean 'middle, between, among and beyond' and from the Greek, Chore derived from phoros, 'to carry or to bear.' The word 'reflect' comes from the Greek re and flex which means 'bending back or bending again.' Putting these together, a reflectaphor can be thought of as having the quality of *carrying between and beyond by a constant bending back*. One side of the reflectaphor is carried over to the other, but then is reflected or carried back again and, therefore, once again beyond. The comparison/contrast design of the reflectaphor propels this movement, bending the mind back again and beyond, giving no rest in conclusion. Between the elements of a reflectaphor there is no meaning as such; the meaning is the continual revelation what Bohm calls unfoldment and unfoldment of this reflective movement.

> Two further important dimensions of the 'reflect' in reflectaphor will also become apparent as we probe deeper into artistic process and structure. First, a reflectaphor mirrors the apprehender of the reflectaphor so that, as Bohm would say, the observer becomes revealed as the observed. Second, a reflectaphor in the context of a particular artwork is mirroring other reflectaphors in that context and in fact is a reflection of the whole of that context (Briggs, 1987/2006).





Lonely seagulls fly nearby There are hardly colours, the whole surroundings grey

Suddenly another ship passes by

Leo Minnigh PhD, Spain O→ Leo's 'Self ←O→ Portrait' ←O Leo's journal page while being *carried* to me, 2002

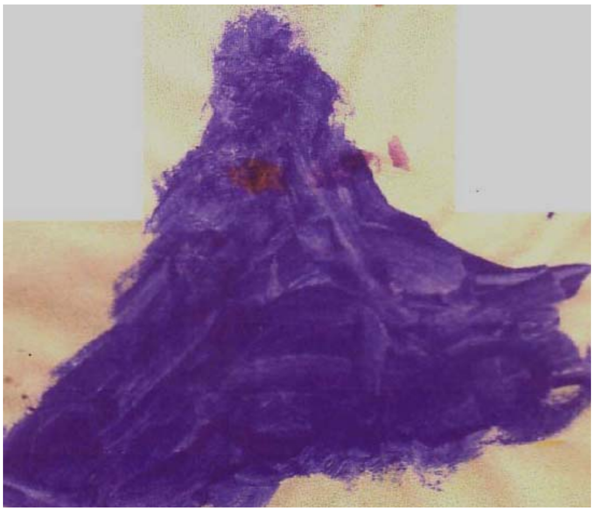
> "I have no idea how that picture I painted appeared, maybe there was something in the strange atmosphere of your garden that day" (L. Minnigh, personal communication, 2003).
>
> "So a moment enfolds all the past? Yes, but the recent past is enfolded more strongly." (Peat & Briggs, 1987/2006).
>
> In the art of painting, reflectaphors exist on a number of levels and are articulated through numerous techniques. For example, reflectaphors can be created when a painting of one thing looks subliminally like another - a building that looks subtly like a face, a range of mountains that is as sensuous as a reclining body (Briggs, 1987/2006).
>
> At times there emanated from people almost palpable extensions of themselves, and certain objects possessed a special dimensionality. A small puddle iridescent with spilt oil and reflecting a patch of mid-western sky would suddenly expand for an endless split-second to encompass my entire universe (Unknown, sculptor, as cited in Briggs, 1987/2006).

This glance of this*other-ness becomes for the artist a touchstone or what Henry James called a 'germ' out of which the piece evolves. The germ might also be thought of as something which serves the artist as a sudden window, opening between the explicate and the implicate. The evolution of the piece out of that germ (a process which Frost described as like *ice riding on its own melting*) is a reflectaphoric evolution, each element emerging in X/Y tension with others. In a peculiar and often quite indirect way, the inspiration for the creation and the thing created began to mirror each other. The initial perception is that some one element idea, memory, melody, contained the whole, and, in the end, the creator produces a form in which each unique element reflects the whole of the piece. Then, since each element in the piece stands or moves beyond itself, the piece as a whole stands beyond itself which, again, is in keeping with the *standing beyond* quality of the piece's inspiration or germ.

The artist's biography also enters strongly into this process. As Rothenberg (1979) has pointed out, many elements of creative works arise out of superimposing remembered or personal experience on to the constraints of the piece. For example, in creating a character, a novelist may adopt personality traits of someone he has actually known or read about as well as his own personality traits, he then finds these traits modified, shaped and coordinated by the imagined events and other characters in his story. The fateful balancing of this unfolding X/Y (which can become exceedingly complex) enters into such important issues as finding the proper 'distance' on the piece, attaining an authentic 'persona' or style and achieving the appropriate voice or tone for the work.

In the evolution of the artwork, the artist doesn't *make choices* according to some analyzable logic or pattern, but chooses elements that feel 'right,' in harmony with the this*other-ness of the germ. In this process, the particular, the individual, the puddle iridescent with oil, the two roads in the woods, the artist's own life becomes the universal. The universal, in turn, is revealed as something immediately present to our senses, the place where implicate and explicate have coalesced.

> The reflectaphor is a hinge between the explicate order of our familiar reality (the grain of sand) and the implicate order (the whole implied by the sand). If we were to observe objects around us as grains of sand, as this*other-nesses, could this provide a new perspective into - evolution? Should our scientific explanations of natural phenomena have a comparison/contrast dynamic between implicate and explicate; between analysis and what lies beyond analysis? Bohm himself has been an advocate of this position. If we were to take such an approach seriously, how would the universe appear to us and how would we perceive nature's laws? Might, for example, the unknown then become a vivid dimension of our experience of the known similar to what happens in metaphor when the unknown emerges out of the junction between the two known terms? In a work of art, only when the unknown or ambiguity is present does one implicitly perceive the whole of the piece and the whole beyond the piece. What would be the role of the observer and the observed in such an X/Y relationship? For ages artists have been portraying the physical world as a reflection of the mind, heart and soul of human beings - and vice-versa. What if the artists are right and the world around us is literally a mirror of our minds (Briggs, 1987/2006).



Mountain Man Acrylics on paper, Unknown (workshop) Artist, 1998

[In this artwork above, one might see that there are two orange ‘marks’ that give to the blue motif the appearance of eyes. What appeared to have happened is that one person had put their partly ‘orange’ picture ‘face down’ on this ‘blue’ one, so leaving a faint imprint. In this way, the blue motif becomes like a Zen mountain, which is somehow now ‘alive’ and has become here a reflectaphor for Brigg’s reflectaphor. When this happens in ‘printing,’ it is called a ‘kiss’ ;-)]

Drei Avantgarde-Strömungen des heutigen US-Geisteslebens – und ihre Beziehung zu Europa

Three avant-garde currents within the contemporary intellectual life in the United States – and in their relationship to Europe

Roland Benedikter

Zusammenfassung: Die heutigen USA gelten vielen als Vorreiter auf dem Weg zur integrativen Erneuerung von Wissenschafts- und Erkenntnisparadigmen. Dies vor allem im Bereich der traditionellen Kern- und Grundlagen-Wissenschaft der neuzeitlichen Universität: der Philosophie und der historisch aus ihr erwachsenen Psychologien. Seit einigen Jahren ist in den USA in der Tat eine Entwicklung im Gang, welche die Einseitigkeiten des nominalistisch-subjektivistischen Paradigmas der „Postmoderne", welches aus ideengeschichtlicher Sicht die Epoche zwischen 1979 und 2001 geprägt hat, um einen neuen geistigen Objektivismus ausgleichen und beide zu einem neuen, „subjektiv-objektiven" Paradigma integrieren will. Diese Entwicklung findet ihren Ausdruck in drei exemplarischen Avantgarde-Strömungen, die im vorliegenden Beitrag vorgestellt sowie auf Charakteristiken und Wechselbeziehungen untersucht werden. Dabei erweist sich, dass die heutige ideengeschichtliche Avantgarde der USA in Kernterminologie, historischer Kontinuität und Ausrichtung stark pazifisch-asiatisch, aber noch zu wenig atlantisch-europäisch geprägt ist. Das scheint mit ein Grund dafür zu sein, warum diese Avantgarde-Ansätze trotz ihres hochwertigen Anregungs- und Innovations-Potentials im Hinblick auf ein ganzheitliches Wissenschafts-Paradigma für das 21. Jahrhundert noch unübersehbare Schwierigkeiten haben, den atlantisch-europäisch geprägten Hauptstrom des Geistes-, Kultur- und politisch-sozialen Lebens ihrer Gesellschaft zu erreichen. Es zeigt sich, dass der innere Ausgleich zwischen pazifischen und atlantischen Ideen-Einflüssen eine der zentralen Herausforderungen für diese Avantgarde-Strömungen, aber darüber hinaus im Spiegelverhältnis auch für das europäische Kultur- und Gesellschafts-Paradigma sowie für die Entwicklung der integralen Bewegungen auf Weltebene insgesamt ist.

Schlüsselwörter: Integrale Bewegungen, Weltphilosophie, Paradigmen-Erneuerung, Ganzheitliche Wissenschaft, Ideengeschichtliches Verhältnis USA-Europa, Ken Wilber, Andrew Cohen, A.H. Almaas, Freimaurerei, Rosenkreuzertum, Anthroposophie, Theosophie

Abstract: Many intellectuals consider the U.S. of today a forerunner for an integrative renewal of scientific and cognitive paradigms, particularly in the field of philosophy and psychology. Indeed, since a few years there have been tendencies which try to compensate the onesidedness of the nominalistic-subjectivistic paradigm of "postmodernism"—which from a historical point of view characterized the period between 1979 and 2001—by a new kind of intellectual objectivism, and to integrate both

SOME RIGHTS RESERVED

into a new, “subjective-objective” paradigm. This trend is represented by three exemplary avant-garde currents which are examined in their characteristics and correlations. It turns out that the basic terminology, historical continuity and orientation of these intellectual-historical avant-garde currents in the U.S. are characterized by Pacific-Asian influences rather than by Atlantic-European ones. This seems to explain at least in part, why in spite of their high-quality innovation potential these avant-garde approaches, in view of a holistic science paradigm for the 21st century, still have problems to reach the mainstream of the intellectual, cultural and politico-social life of their society. It becomes apparent that the harmony of Pacific and Atlantic influences of ideas and intellectual traditions poses a central challenge to these three avant-garde currents, but also to the European cultural and social paradigm, as well as to the development of integral currents worldwide.

Keywords: A.H. Almaas, anthroposophy, Andrew Cohen, freemasonry, holistic science, intellectual-historical relationship U.S.-Europe, integral currents, renewal of paradigms, rosicrucianism, theosophy, world philosophy, Ken Wilber.

Einleitung

Wer sich mit dem US-amerikanischen Geistesleben der Gegenwart auseinandersetzt, begegnet heute einerseits der Wiederauferstehung der konfessionellen Glaubens-Religionen seit der weltpolitischen Wende 1989-91, andererseits den Resten des New Age der 1980er und 1990er Jahre. Beide Strömungen agieren tendenziell fundamentalistisch und regressiv; der Unterschied zwischen ihnen ist die tendenziell expansive Haltung der traditionellen Religionen und die tendenziell defensive Haltung des New Age. Darüber hinaus begegnet man heute in den USA aber auch drei grossen, ihrem Anspruch nach integrativ-fortschrittlichen Impulsen, die nach einer „rationalen Spiritualität“ im Sinne eines neuen Gesamt-Paradigmas für die gegenwärtig entstehende erste Welt-Kultur tasten: Einer *philosophisch-wissenschaftlichen* integralen Strömung (*Ken Wilber*), einer *kommunitarisch-intersubjektiven* integralen Strömung (*Andrew Cohen*) und einer *psychologisch-introspektiven* integralen Strömung (*A. H. Almaas*).[1]

Alle diese drei Avantgarde-Strömungen verfolgen das Ziel umfassender geistiger, gesellschaftlicher und politisch-sozialer Erneuerung aus dem Geist einer spirituell angereicherten Aufklärung. Alle drei versuchen, Wissenschaft, Rationalität und Spiritualität in neuer Weise zu integrieren. Alle drei versuchen, sowohl natur- wie geisteswissenschaftlichen und psychologischen Objektivismus mit seinen „postmodern“-subjektkritischen Antigonen zu verbinden. Das heißt: alle drei versuchen eine neue Synthese zwischen „Nominalismus“ und

---

[1] Ich nehme die folgenden Kategorisierungen hier vor, um die drei Strömungen einführend zu charakterisieren. Festzuhalten ist, dass damit nur ihre Schwerpunkt-Setzungen typologisch charakterisiert werden. Bei genauerem Eindringen in deren Gehalte wird das Bild selbstverständlich komplexer, und es zeigt sich, dass jede der drei Strömungen auch Elemente der jeweils anderen enthält. So sind bei Ken Wilber genauso psychologisch-introspektive und intersubjektive Komponenten enthalten wie bei Almaas; A. H. Almaas verfolgt genauso seine kommunitarische Gemeinschaftsbildung wie Cohen, während Wilber sich derzeit ebenfalls eine weltweite virtuelle Gemeinschaft aufbaut; Andrew Cohen verweist ebenso wie Almaas und Wilber auf die Notwendigkeit von psychologischem „Shadow-work,“ um geistige Fortschritte zu machen; Wilbers Ansatz geht im Prinzip wie die beiden anderen ebenfalls von einem Vorrang der Praxis geistiger Entwicklung vor philosophisch-wissenschaftlicher Modellbildung und Theorie aus, usw.

„Realismus“ – zwei Strömungen, die mit der Kantiantischen Aufklärung mit weitreichen Folgen auseinandergefallen sind. Alle drei versuchen zu diesem Zweck eine neuartige Verbindung von Wissenschaft, Philosophie, Psychologie und Spiritualität aus Ost und West zu einem ersten Welt-System von Erkenntnis und Praxis, um eine „subjektiv-objektive“, wissenschaftlich-kritische geistige Kultur für das globalisierte 21. Jahrhundert grundzulegen. Und alle drei verstehen sich diesbezüglich als Vorreiter der heute weltweit keimenden „integralen“ Intuition und ihrer sich allmählich transkulturell organisierenden Bewegung, sowie der durch sie mitinitiierten globalen Paradigmenverschiebung.

Angesichts dieser Gemeinsamkeiten, aber auch ihrer nicht zu übersehenden Unterschiede zu europäischen Entwicklungen stellen sich die Fragen: Welcher Wert kommt diesen US-amerikanischen Impulsen der Gegenwart zu? Und wie verhalten sie sich zu den wissenschaftlich-spirituellen Haupt-Strömungen Europas seit dem 18. Jahrhundert?

Die drei Avantgarde-Strömungen

Die USA gelten als die Geburtsstätte des modernen „New Age“, aber auch der Entstehung einer spezifisch „amerikanischen“ Spiritualität. Letztere hat eine komplexe Geschichte, die im Grundmotiv darin besteht, dass die christlich geprägten rosenkreuzerisch-freimaurerischen Wurzeln, die an der „atlantischen“ Wiege der amerikanischen Verfassung von 1776 standen, seit dem Beginn des 20. Jahrhunderts, vor allem nach dem zweiten Weltkrieg immer stärker durch asiatisch-östliche Einflüsse von „pazifischer“ Seite ergänzt wurden. Während die empirisch-christliche Tradition, noch vor der französischen Revolution, als rosenkreuzerisch-freimaurerischer Einfluß mit der amerikanischen Verfassung 1776 die Gründung der USA inspirierte, sich Mitte des 19. Jahrhunderts zunächst mithilfe des britischen Weltreichs als politisch-geistige Weltmission des Angelsachsentums etablierte, und dann nach dem ersten, und endgültig nach dem zweiten Weltkrieg bis heute Selbstverständnis und Mission der USA als Leitmacht des Westens prägte, drangen östliche Philosophie und Weisheit seit der „indischen Renaissance“ Ende des 19. Jahrhunderts zunächst mit Vivekananda und Yogananda, dann mit dem Gedankengut Aurobindos sowie des in den 1930er Jahren im Westen bekannter werdenden Tibet von pazifischer Seite her ein.

Daraus entstand insbesondere mit der 1968er Bewegung ein eigenständiger Humus, in dem östliche und westliche Strömungen in weit intensiverer und offenerer Weise in Begegnung kamen als in Europa. Nach der weltpolitischen Wende mit dem Fall der Berliner Mauer und dem Zusammenbruchs des Kommunismus 1989-91, und noch einmal verstärkt seit dem 11. September 2001 und der damit symptomatisch beginnenden Paradigmenverschiebung von der europäisch-westlichen „Postmoderne“ hin zu einer stärker global-integrativen „Post-Postmoderne“, hat sich diese Begegnung in *drei* große Strömungen ausdifferenziert. Für diese drei Strömungen stehen heute die Signal-Namen ihrer drei großen Pioniere: Ken Wilber, Andrew Cohen und A. H. Almaas. Diese drei Strömungen sind deshalb neuartig, weil sie alle drei Reaktionen auf die neuen, weit stärker als bisher *integralen* (oder „subjektiv-objektiven“) Kultur- und Paradigmen-Anforderungen exakt im *Schnittpunkt* zwischen säkularen und religiösen, natur- und geisteswissenschaftlichen Dimensionen des 21. Jahrhundert sind: Auf die Anforderungen im Zeitalter der globalen „Renaissance der Religionen“ und ihres bereits in Gang befindlichen, latenten Kulturkampfs gegen das Erbe der europäischen „Postmoderne“; auf die einseitige subjektivistische Verengung der akademischen Geistes- und Sozialwissenschaften;

aber auch auf die ebenso einseitige „Neuerfindung des Menschen durch den Menschen“ seitens der objektivistischen Naturwissenschaften.

Die drei innovativen Strömungen des aktuellen US-Geisteslebens strahlen heute in avantgardistischer Weise in die ganze Welt aus - insbesondere auch nach Europa, das vor allem seit der 1968er Revolution traditionell stark unter dem Einfluß von progressiven US-Entwicklungen steht. Sie halten weitgehend freundschaftlichen Kontakt zueinander und tauschen sich aktiv untereinander aus, weil sie sich alle drei als eine im epochalen Kernimpuls, in geistigen Kern und im zentralen Ziel gemeinsame, zum Teil sogar identische Kultur-Avantgarde für das 21. Jahrhundert verstehen. Ihre Ausdifferenzierung erfolgt deshalb bislang nicht vorrangig untereinander, sondern hauptsächlich gegenüber den in den USA noch immer weit verbreiteten Erben und Epigonen des „New Age“, das sie übereinstimmend als regressive, ja inzwischen großteils atavistische, weil *unwissenschaftliche* Vorläufer-Spielart ihrer entscheidend progressiven und innovativen *wissenschaftlichen* Bewegung verstehen. Deshalb bekämpfen sie dieses „New Age“ im Rahmen eines mehr oder weniger offenen Kulturkampfs um eine paradigmatisch neue, progressive kulturelle Leit-Spiritualität für die westliche Kultur des 21. Jahrhunderts auch aktiv, und suchen zugleich seine bisherigen, ursprünglich ebenfalls an Evolution von Spiritualität interessierten Anhänger für ihr evolutives Kern-Anliegen zu gewinnen. Dabei verfolgen alle drei zwar im Kern verwandte, jedoch in ihrer jeweiligen Schwerpunktsetzung unterschiedliche Strategien.

Die Auswahl dieser drei Avantgarde-Ansätze ist im folgenden Essay, der sich auf ausgewählte qualitative Analysen stützt und ausdrücklich keine feldumfassende empirische Untersuchung darstellt, nur symptomatisch und beispielhaft gemeint. Sie erhebt nicht den Anspruch auf Repräsentativität. Denn natürlich sind diese drei Ansätze keineswegs die einzigen ihrer Art, wenn auch die derzeit bekanntesten, umfassendsten und einflußreichsten. Sie stellen demnach eine Art „Spitze des Eisbergs“ dar – nicht mehr, aber auch nicht weniger. Es bestehen darüber hinaus eine ganze Reihe von weiteren innovativen Ansätzen, die in ähnlicher Weise den Weg hin zu einer „subjektiv-objektiven“ „rationalen Spiritualität“ beschreiten. Ich kann diese Ansätze hier nicht behandeln, weil sie den Rahmen des im folgenden Intendierten sprengen würden, und konzentriere mich daher auf die drei genannten Symptom-Ansätze, die auf auch für verwandte Ansätze beispielhafte Weise wesentliche Aspekte einer heute allgemein keimenden *integrativen bis integralen Intuition* in sich verbinden.[2]

Die philosophisch-wissenschaftliche Strömung: Ken Wilber

Die *erste symptomatische Strömung* (mit Zentrierung auf *Philosophie und Wissenschaft*) ist wesentlich auf das „Kleinod der Unterscheidung“ des willensgesättigten *Denkens* ausgerichtet. Durch sorgfältige historisch-analytische Begriffsarbeit und durch Vergleich der Substanz im Prinzip sämtlicher großer Welt-Traditionen in Philosophie, Wissenschaft, Religion und Spiritualität mittels der synthetisierenden Methode von „Orientierungs-Verallgemeinerungen“

---

[2] Die vergleichende Auseinandersetzung mit weiteren verwandten Ansätzen ist Teil meines in Vorbereitung befindlichen größeren Publikations-Projekts „A Global History of Integral Thought from the 18th to the 21st Century“ sind (erscheint voraussichtlich 2007-08). Darunter sind, um hier nur einige Beispiele zu nennen, Arthur Zajonc und Stephen Wolinsky (Quantenpsychologie), Steven Harrison (Post-Spirituality) oder die Vertreter des weiter unten nur summarisch genannten Californian Institute for Integral Studies CIIS San Francisco wie etwa Richard Tarnas, Robert McDermott, Jorge Ferrer und andere.

soll eine erste echte Weltphilosophie als Vereinigung von Ost und West begründet werden. Diese soll ihrem erkenntnis- und handlungsleitenden Anspruch nach alle geistigen, religiösen, philosophischen und psychologischen Ansätze, aber auch die Errungenschaften der „Postmoderne“ und der Sozial- und Naturwissenschaften integrieren und zu einem neuen, inklusiven, sowohl subjektiven wie objektiven Wissenschaftssystem der Erkenntnis und der gesellschaftlichen Praxis für das 21. Jahrhundert zusammenführen. Damit ist der heute weltweit bedeutendste „integrale Ansatz“ (unter zunehmend vielen ähnlichen Intuitionen, die mittlerweile das Wort „integral“ inflationär im Munde führen) umrissen; und für ihn steht der Name eines großen Pioniers und Vordenkers: *Ken Wilber*. Wilber, geboren 1949 als Sohn eines US-Armeeangehörigen, Autodidakt und nach eigenen Angaben inzwischen Eingeweihter der höchsten Bewusstseinstufe, hat seit den frühen 1980er Jahren 22 auf verschiedenen Gebieten als bahnbrechend rezipierte Bücher verfasst, die in 30 Sprachen übersetzt wurden. Darunter ist eines der zweifellos wichtigsten philosophischen Werke an der Schwelle zwischen 20. und 21. Jahrhundert: *Eros, Kosmos, Logos. Eine Jahrtausend-Vision* (Frankfurt am Main 2000). Wilber bezeichnet sich selbst ausdrücklich nicht als „Guru“ (wörtlich: „Helfer bei der Austreibung der Dunkelheit“), sondern als „Pandit“ (wörtlich: „Gelehrter“) und als „Begriffs-Krieger“, dessen schicksalshafte Aufgabe es sei, die geistig-begriffliche Vereinseitigung westlicher Kultur durch klares Denken neu zu ordnen und zu klären. Er gilt heute nicht nur als der weltweit führende integrale philosophische Denker, sondern insbesondere wegen seiner bahnbrechenden Leistungen auf dem Gebiet der theoretischen, die Ansätze von Ost und West zusammenführenden inklusiv-ganzheitlichen Psychologie, auch als „Einstein einer neuen, inklusiven Bewusstseinsforschung“. Wilber führt im Internet den vielgelesenen Blog „www.kenwilber.com“ und ist nach Auskunft seiner Verlage seit Jahren einer der meistgelesenen – und sowohl meistveröffentlichten, meistübersetzten und meistzitierten, wie auch meistkritisierten[3] - philosophisch-wissenschaftlichen Sachbuchautoren der Welt. Er begründete in den 1990er Jahren unter anderem das „Integral Institute“ in Denver, Colorado, in dessen Rahmen sein neuer Wissenschaftsimpuls in transdisziplinärer Zusammenarbeit zwischen Wissenschaftlern und Philosophen aus den verschiedensten Disziplinen zum Durchbruch geführt werden soll, und ist seit einigen Jahren dabei, eine eigene „Integrale Universität“ zu akkreditieren (siehe www.integralinstitute.org).[4] Zu seinen Sympathisanten und Anhängern gehören in den USA mittlerweile zahlreiche bekannte Persönlichkeiten aus Wissenschaft, Kunst und Politik, so unter anderem Billy Corgan, Gründer der einflußreichen Pop-Gruppe „The

---

[3] Siehe dazu vor allem die Internet-Seite seines Biographen und ehemals wichtigsten europäischen Übersetzers und Freundes Frank Visser: www.integralworld.net.

[4] Kritisch anzumerken ist, dass Wilber seit einigen Jahren die immer wieder zu einem neuen Termin angekündigte Eröffnung immer wieder verschiebt. Auch für die erste Jahreshälfte 2006 wurde die Eröffnung der Privatuniversität erneut angekündigt und wieder verschoben. Zu den Verzögerungen trägt bei, dass sich leitende Mitarbeiter in den Fachbereichen der geplanten Universität aufgrund von Wilbers autoritärem Stil immer wieder nach kurzer Zeit verabschieden (so etwa der ehemalige Mitbegründer der Erziehungswissenschaftlichen Fachgruppe Arthur Zajonc). Derzeit wird noch keiner der Fachbereiche von einer akademisch einigermaßen bekannten Persönlichkeit geleitet. Die richtige Strategie wäre es wohl, Studiengänge in Partnerschaft mit etablierten Universitäten anzubieten, wobei verschiedene Partner-Universitäten gewonnen werden sollten. Die derzeit bestehende Zusammenarbeit mit der US-weit führenden katholischen Universität Notre Dame bei Chicago, für deren „Integral Studies Program“ Wilber gegen Bezahlung seinen Namen verleiht, ohne weitere Kontakte zu pflegen oder an der Entwicklung der Programme teilzunehmen, scheint dafür allerdings ebenso wenig ein zu verfolgender Weg wie seine periodischen Gastvorlesungen an der John F. Kennedy Universität New York.

Smashing Pumpkins“, die Gebrüder Wachowski (Autoren der „Matrix“-Trilogie, für deren DVD-Edition Wilber auf Einladung der Wachowskis den bisher ausführlichsten Kommentar verfaßte) und Politiker wie Bill und Hillary Clinton sowie Al Gore. In Deutschland hat sich in den späten 1990er Jahren ein „Arbeitskreis Ken Wilber“ (www.ak-kenwilber.org) gebildet, der seit Frühjahr 2006 unter dem Namen „Integrales Forum“ auftritt (www.integralesforum.org) und heute Regional- und Fachgruppen im gesamten deutschen Sprachraum unterhält. Er zieht eine wachsende Anzahl von integral und zugleich philosophisch-wissenschaftlich interessierten Menschen an. Wilber ist seit jungen Jahren praktizierender Anhänger des Zen-Buddhismus und lebte seit den 1980er Jahren bis zur Jahrtausendwende in strenger Disziplin und weitgehender Einsamkeit wie ein buddhistischer Mönch. Er seit einigen Jahren ist er zu persönlichen Interviews und zu öffentlicher Lehre bereit, und erst seit der Jahrtausendwende gibt es auch einige Tonbandaufnahmen und Lehrfilme von ihm, die in Internet (siehe http://in.integralinstitute.org) und in fachinteressierten Kreisen kursieren.

Die kommunitarisch-intersubjektive Strömung: Andrew Cohen

Die *zweite* wichtige *Strömung* heutigen US-amerikanischen Geisteslebens (mit Zentrierung auf *Gemeinschaftsbildung und neuem meta-individuellen Bewusstsein*) geht von der Kommunion in einem gefühlsgesättigten *Willen* aus. Durch gemeinsame, vorwiegend kollektiv praktizierte Meditation soll das Ego überwunden und eine durch Wechselseitigkeit verstärkte spirituelle Erfahrung eröffnet werden, welche Rudolf Steiner für das 21. Jahrhundert als eine mögliche Fortschrittsform allgemeiner Entwicklung erwartete und den „Ritus von unten“ nannte. Dieser Ansatz nennt sich „Evolutionäre Spiritualität,“ und für ihn steht der Name eines zweiten großen Pioniers kritisch-geistiger Erneuerung, die von den USA aus weltweit auszustrahlen beginnt: *Andrew Cohen* (geboren 1955 in New York). Cohen schrieb mehrere Bücher und begründete 1991 die international einflussreiche Zeitschrift „What is Enlightenment?“ - und zwar ausdrücklich in der ursprünglichen, im angelsächsischen Raum bis heute gültigen englischen Doppelbedeutung „Was ist Aufklärung?“ und „Was ist Erleuchtung?“, die im deutschen Sprachraum mit den Totalitarismen des 20. Jahrhunderts ideengeschichtlich zum Schaden eines ausbalancierten Kultur-Paradigmas verloren ging (siehe www.wie.org, auf der Cohen auch auf verschiedenen Videos und in Audio-Aufnahmen direkt zu erleben ist). Für diese inzwischen weltbekannte, seit einigen Jahren in eigener Ausgabe auch in deutscher Sprache erhältliche Zeitschrift schreiben Autoren wie Robert F. Kennedy Jr. mit Beteiligung u.a. des Dalai Lama oder Carlos Santana. Darüber hinaus begründete er einen eigenen Studiengang in Assoziation mit einer bekannten US-Privat-Universität, das Graduate Institute in Milford bei New York, das den regulären, US-weit anerkannten Master of Arts in „Conscious Evolution“ vergibt (siehe www.learn.edu/wie/). Cohen erlangte seine persönliche spirituelle Erleuchtung samt der Sicherheit, eine Mission als spiritueller Lehrer für die Entwicklung der europäisch-westlichen Welt zu haben, nach einem frühen Erlebnis mit 16 Jahren schließlich 1986 in Indien. Seitdem ist seine zentrale Frage, was der Zusammenhang zwischen „Aufklärung“ und „Erleuchtung“ in der heutigen Zeit für eine Bedeutung haben könne, und welches die zeitgemäßeste Form für die Verwirklichung von beidem in den entwickeltsten Gesellschaften im 21. Jahrhundert sein kann – individuell und gesellschaftlich. Dabei unterscheidet er zwischen persönlicher und evolutionärer „Aufklärung / Erleuchtung“. Erstere ist individuell, letztere – welche die Zukunft darstellt – ist dialogisch und interpersonal. Cohen begründete Ken Wilber’s „Integrales Institut“ mit und steht mit Wilber in einem ebenso intellektuell-inhaltlich beispielhaften wie öffentlichkeitswirksamen öffentlichen Dialog über die Zukunft von Kultur, Religion, Wissenschaft und Spiritualität, der von vielen „Kulturell Kreativen“ weltweit intensiv verfolgt wird (siehe die inzwischen zehn Lang-Gespräche zwischen Wilber und Cohen zum Problem einer zeitgemäßen, zukunftsorientierten und wissenschaftlichen Spiritualität in: www.wie.org). Cohen versteht sich selbst weniger als Wissenschaftler oder Philosoph, als vielmehr als „Praktiker“ und als Lehrer, dessen Kernmotiv die Verwirklichung eines neuen, für die gesamte Kultur vorausweisenden Bewusstseins mit den Menschen ist, die sich konkret um ihn scharen. Zentren seines Ansatzes der „evolutionären Spiritualität“ bestehen derzeit in New York, Boston, London, Amsterdam, Paris, Frankfurt, Copenhagen und Rishikesh (Indien). Cohen’s innere Entwicklung ging vom Kriya Yoga (u.a. Yogananda) über den Buddismus zum Advaita Vedanta (H.W.L. Poonja), dem er heute in eigenständiger Ausprägung angehört.[5]

Die psychologisch-introspektive Strömung: A. H. Almaas

Die *dritte Strömung* (mit Zentrierung auf *personaler Überwindung des Ego und Durchbruch zum „permanenten Ursprung allen Seins als Selbst“*) ist in ihrem Zentrum auf die (Selbst-) Durchleuchtung und seelische Kultivierung des *Gefühls* als Wahrnehmungs- und Urteilsorgan zentriert. Hier wird durch das Zerbrechen der Ich-Illusion mittels individueller, wesentlich auch tiefenpsychologisch initiierter Selbst-Erkenntnisübung der „Diamant“ des reinen, vor-egoischen Ursprungs der Wirklichkeit als dauerndes ur-intentionales Quellen des Selbst erfahren und anschließend begrifflich angeeignet. Für diese Strömung, auch „Diamanten-Ansatz“ genannt, steht der Name A. H. Almaas (A. Hamed Ali, geboren 1944). Almaas, ursprünglich aus dem Nahen Osten (Kuwait) stammend, studierte in den 1970er Jahren zunächst Physik an der Universität Berkeley, um nach verschiedenen Einsichts-Erlebnissen eine tiefenpsychologisch-therapeutische Gruppen-Praxis in Kalifornien zu eröffnen, aus der sein Ansatz im Lauf der Zeit hervorging. Der „Diamenten“-Ansatz ist eine Mischung aus Sufismus, Psychoanalyse, Objekt-Relationstheorie und verschiedenen Einzelinstrumenten wie dem Enneagramm; er besteht aus einer Mischung zwischen individueller und kollektiver Arbeit, wobei das Verhältnis zum Lehrer zentral bleibt.[6] Almaas schrieb mehrere Bücher, in denen er seinen Versuch der Verbindung von westlicher Tiefenpsychologie, philosophisch fühlender Klärung des Geistes und mystischen Traditionen in großer Klarheit erläutert. Darunter ist die bislang beste und persönlichste Einleitung in seine Spielart der „ewigen Philosophie“, das autobiographische „Luminous Night’s Journey“ („Reise durch die leuchtende Nacht“, derzeit noch nicht ins Deutsche übersetzt, 2000). Wie Cohen versteht sich Almaas weniger als Theoretiker, denn als Praktiker und Guru. Trotzdem legt er einen wesentlichen Teil seines Augenmerks auf die wissenschaftlich-psychologische Selbstdurchsichtigkeit und philosophisch-begrifflich genaue Fundierung seines Ansatzes. Almaas' Schule hat heute ihre Haupt-Zentren in Berkeley und in Boulder, Colorado (der langjährigen Heimatstadt von Ken Wilber). Sie betreibt eine eigene Internetseite unter www.ahalmaas.com.

---

[5] Was viele Kritiker jedoch anmerken ist, dass Cohen keinem Pfad über einen substanziellen Zeitraum gefolgt ist. Es gibt auch manche kritische Stimmen, die Cohen die Fähigkeit absprechen, eine spirituelle Gemeinschaft zu leiten. Siehe dazu nun Cohens ausführliche Antwort: A Declaration of Integrity. An open letter from Andrew Cohen to his friends and foes. In: http://www.andrewcohen.org/blog/index.php?/blog/post/declaration-of-integrity, October 18, 2006.

[6] Kritiker bemängeln, dass Almaas sich den „Diamanten-Ansatz“ als rechtlich geschütztes Trademark hat eintragen lassen. Dieses unternehmensrechtliche Schutzverfahren ist für geistig-kulturelle Strömungen unüblich, da diese im allgemeinen ohne Normierung und Kopierschutz arbeiten und es ihnen trotzdem - oder vielleicht gerade deshalb - gelingt, ihr Anliegen bekannt zu machen und über die Welt zu verbreiten. Die Partizipations- und Dialogfähigkeit von Almaas’ Ansatz wird durch dieses Vorgehen jedenfalls eher behindert als gefördert.

Gemeinsamkeiten und Unterschiede

Allen diesen drei Avantgarde-Strömungen heutigen US-Geisteslebens *gemeinsam* ist,

1. Dass sie komplementaritätsorientiert zum akademischen, stark postmodern-dekonstruktivistisch und europäisch-säkular gefärbten Intellektualismus des öffentlichen Kulturparadigmas einen philosophisch begründeten, integral-spirituellen Erkenntnis-Anspruch vorantragen, der auf die gesamte europäisch-westliche Kultur ausstrahlen und ihr Paradigma erweitern und integrativer machen soll;
2. Dass sie dabei in starkem Antagonismus sowohl zum „New Age" wie zu den traditionellen Religionen des „abrahamitischen Komplexes" (Christentum, Islam, Judentum) mit Ausnahme von deren mystischen Anteilen sowie mit Ausnahme östlicher und mittelöstlicher Wege (Buddhismus, hinduistische Traditionen) stehen;
3. Dass sie einen „integralen" Anspruch vertreten, und sich daher mit möglichst vielen fortschrittlichen Denkweisen und Philosophien weltweit, einschließlich der „Postmoderne", kritisch-affirmativ beschäftigen; und dass sie darüber hinaus auch untereinander einen intensiven, auf wechselseitiger Anerkennung und Komplementaritätsbildung beruhenden Dialog zu pflegen versuchen, der allerdings erst in den ersten Stadien steht und nicht ohne Konflikte und Abgrenzungstendenzen innerhalb aller drei Strömungen verläuft;[7]

---

[7] Insbesondere der Dialog zwischen Cohen und Wilber ist nennenswert und weist Kontinuität und öffentliche Präsenz auf; weniger entwickelt ist der Dialog dieser beiden Strömungen mit Almaas. Wie ein an integraler Wissenschafts-Entwicklung interessierter Kollege in unserem Briefverkehr zur prinzipiellen Frage der Dialog-Führung zwischen führenden integralen Strömungen meines Erachtens zu Recht kritisch anmerkt, ist es noch offen, inwieweit Dialog und bewusste Komplementaritäts- und Koalitionsbildung in der angestrebten Qualität durchzusetzen sind. „Dass die verschiedenen integralen Strömungen weltweit einen intensiven, auf wechselseitige Anerkennung und Komplementaritätsbildung beruhenden Dialog pflegen, ist trotz vielversprechender Anfänge in weiten Teilen letztlich doch noch eine Utopie. Dies gilt… gerade für den Dialog zwischen Europa und Amerika. Jeder gibt sich natürlich schön dialogoffen, aber warum reden Wilber und Nicolescu, Almaas und Heinrichs usw. eigentlich weder öffentlich noch privat mit einander? Warum kennen sie sich noch nicht einmal vertieft*? Genau das ist das Problem heute, das es keine meta-integralen Dialoge quer zu den verschiedenen Strömungen gibt, die systematisch und weltweit organisiert wären.* Daher ist neben der Dialogbemühung auch wahr, dass sich gleichzeitig jede Strömung doch irgendwie als besser als die anderen, als integraler empfindet. Das ist eine echte Krankheit, von der in meinen Augen gerade auch Wilber sehr ergriffen ist." (Brief an den Autor, 05.09.2006). Der Überwindung des noch bestehenden Dialog-Defizits vor allem in US-europäischer Perspektive und im Hinblick auf die gleichzeitig notwendige komplementäre Ausdifferenzierung sind u.a. mein in Vorbereitung befindliches Projekt „A Global History of Integral Thought" (a.a.O.) sowie mein Buch „Ken Wilber und die Anthroposophie. Elemente für den Dialog" (erscheint voraussichtlich 2007) gewidmet.

4. Dass sie dabei auf je eigenständige Weise in individueller Erfahrung, analytisch-deskriptiver Begriffsbildung wie „harter“, objektiv-empirischer Datengewinnung echtes Neuland im Hinblick auf das nun notwendige „subjektiv-objektive“ Welt-Paradigma des 21. Jahrhunderts eröffnen;
5. Dass sie sich im Kern als „weltzugewandt“, das heißt „realisations- und handlungsorientiert“ verstehen, und daher nicht nur philosophisch-spirituelle, sondern ganz wesentlich auch sowohl allgemein-gesellschaftliche wie insbesondere kulturelle und politische Valenz beanspruchen;
6. Dass sie allesamt von großen charismatischen Pionieren getragen werden, die alle drei noch vergleichsweise jung sind, aber bereits ein beeindruckendes individuelles Fundament für das Neue gelegt haben, das zum Großteil erst noch der Ausarbeitung auf einer breiteren wissenschaftlich-empirischen Basis harrt, für welche die Grundlagen in entsprechenden Universitäts- oder Instituts-Gründungen bereitstehen;
7. Dass sie alle drei stark „pazifisch“ (das heißt: aus östlich-asiatischen Wurzeln gespeist) statt „atlantisch“ (aus europäisch-westlichen Wurzeln hervorgehend) begründet sind.[8] Alle drei haben bislang wenig Berührung zu den die USA nach wie vor geistig, kulturell, politisch und sozial bestimmenden traditionellen okkulten Strömungen des Westens wie Rosenkreuzertum und Freimaurerei sowie deren Seitenströmungen und Fortbildungen, darunter Theosophie und Anthroposophie;[9]

---

[8] Die europäisch-westlichen integralen Ansätze, z.B. aus Deutschland und Frankreich, werden in den USA praktisch nicht rezipiert, solange sie nicht in englischer Sprache vorliegen, was bisher nur in Ausnahmefällen gegeben ist. Wilber ist z.B. erst dann auf Gebser gestoßen, als Jahrzehnte nach dem Original eine Übersetzung eines Artikels von diesem angefertigt wurde. Anders steht es mit den Buddhisten und Hinduisten, die konkret damit angefangen haben, persönlich in die USA zu gehen und auch solche amerikanischen Schüler als Lehrer auszubilden, die ihre Ansätze dort angemessen verbreiten konnten.

[9] Inwiefern diese aus Europa stammenden geistigen Strömungen mit ihren in die Vormoderne reichenden Wurzeln im heutigen Sinn als genuin „subjektiv-objektiv“, „integrativ oder gar „integral“ gelten können, muss in philosophisch-ideengeschichtlich exakter Weise erst noch Gegenstand der Klärung sein. Ich habe dazu einige Elemente und Bausteine unterscheidender Urteilskraft im Rahmen der methodisch-systematischen Vorbereitung meines Publikations-Projekts „A Global History of Integral Thought from the 18th to the 21st Century“ (a.a.O.) in verschiedenen europaweit ausgetragenen Seminaren zur Einführung in die weltweiten integralen Bewegungen entwickelt, die aber den Rahmen dieser Abhandlung sprengen würden. Im wesentlichen kann davon ausgegangen werden, dass Integration, soweit dieser Begriff konstruktiven Sinn macht und soweit er in progressiver Weise angewendet wird, stets auf vorgängiger – gesellschaftlicher, methodischer und/oder terminologischer – Ausdifferenzierung beruht, und dass daher „integral“ im aufgeklärten Wortsinn für die Gegenwart stets „Integration auf der Grundlage von vorausgehender Differenzierung“ meint. Wenn dem so ist, dann ist bei Strömungen wie der Freimaurerei und dem Rosenkreuzertum dieses Kriterium zumindest in der Frühzeit ihrer Entwicklung nicht oder nur ansatzweise gegeben, da sie deutlich im vormodern-theokratischen und also im Kern gesellschaftsunitarischen Bereich wurzeln; sie wären daher als „prä-integral“, als „proto-integral“ oder als Vorläuferströmungen der modernen Integralen Bewegungen zu kennzeichnen. Allerdings haben sie zugleich die Entwicklung der Moderne und ihrer ausdifferenzierenden – und darauf aufbauend das integrative Element gerade erst notwendig machenden – Tendenz erstens wesentlich, ja entscheidend mit inauguriert, zweitens bis heute begleitet und sich dabei zu einem Teil der Moderne weitergebildet. Im wesentlichen kann für einen kritischen Gesamtüberblick gelten, dass das integrale Welt-Motiv der Gegenwart wesentliche Schichten und Wurzeln in der europäischen Ideengeschichte zwischen dem 12. und dem 18. Jahrhundert besitzt, die heute massiv, wenn auch weitgehend unbewußt

8. Dass alle drei trotzdem auch für den christlich-rosenkreuzerisch-freimaurerischen Hauptstrom der US-Kultur und für die geistigen Entwicklungen Europas wesentliche Impulse des Neuen darstellen, die hier allerdings entsprechend adaptiert und kontextadäquat neu gefasst werden müssen, um den Hauptstrom der hiesigen ideengeschichtlichen und geistigen Entwicklung zu erreichen, aufzunehmen und zu entwickeln. Bislang wird, eben auch aufgrund der stark „östlichen" Kern-Prägung der drei Ansätze, insbesondere die europäische akademische, öffentlich anerkannte Kultur noch kaum von ihnen erreicht. Insbesondere der wissenschaftlich-philosophische Ansatz Ken Wilbers, der das größte rational-kulturadäquate Potenzial dafür hätte und auch nach dem Willen seines Pioniers ausdrücklich den Eingang in das geltende akademische Paradigma anstrebt, wird derzeit noch weitestgehend von diesem abgewiesen. Das hat seine Gründe zwar nicht ausschließlich, aber *auch* in der bislang weitgehend fehlenden ideengeschichtlichen und okkulten Anbindung an den begrifflichen und ideellen Hauptstrom europäisch-westlicher Erfahrung mit der Gnostik, und an deren heutige, in jahrhundertelangen Prozessen gewachsene Situation.

Es handelt sich um allesamt quantitativ vor Ort eher kleine „communities" mit ihren eigenen inneren Chancen und Problemen, die aber, was ihre Ausstrahlung mittels Medien, vor allem Büchern, betrifft, mittlerweile zu den potentesten und wirksamsten weltweit gehören. Alle drei haben mittlerweile eigene universitäre Studiengangs-Gründungen mit anerkannten Master- und Doktorats-Abschlüssen bereits vollzogen oder sind dazu unterwegs, alle drei sind ideologisch nicht dem traditionellen politischen Spektrum der USA zuordenbar, und alle sind drei bereits einflussreich für die Gesamtfärbung der gegenwärtigen amerikanischen „Paradigmenverschiebung" tätig.

Alle drei Strömungen sind insgesamt Teil der historischen Ausdifferenzierung einer mittlerweile 40 Jahre alten Welt-Kultur-Intuition: der Integralen Intuition. Diese Intuition keimte im 20. Jahrhundert unabhängig voneinander sowohl im Osten, in Europa und im Westen, konnte aber nur in den USA und ihrer vergleichsweise „reinen" Willensgrundierung in Gestalt der Anfänge der Umweltbewegung (vor allem Rachel Carsons: Der stumme Frühling / The silent spring, 1962), der anti-rassistischen Bürgerrechtsbewegung seit den 1950er und 1960er Jahren und schließlich, zusammenfassend, der 1968er Studenten-Revolution und ihrer seelischen Erneuerung der Grundmotivs moderner Gesellschaften: „Freiheit – Gleichheit – Brüderlichkeit" zu jenem avantgardistischen Welt-Gesellschaftsimpuls werden, der von der Universität Berkeley (San Francisco) ausgehend als grundlegender Paradigmen-Schub in die gesamte europäisch-westliche Welt ausstrahlte. Die in den USA seit ihrer Gründung ausschlaggebende innere Dialektik zwischen Pragmatismus und Idealismus war es, die, wie seit jeher, der „natürlichen" Willensspiritualität dieser Kultur ihre Struktur, ihre Entwicklungsgesetzmäßigkeit und ihre intime Zeitgestalt im Zusammenhang zwischen Kontinuität und Wahrheit gab.[10]

---

geworden wirken, und auf diefaktisch auch noch die asiatischen Strömungen aufbauen, so etwa Aurobindo, der mutmaßlich erst aufgrund seiner britischen Erziehung auf die Idee kam, seinen in Indien begründeten geistigen Impuls „integral" zu nennen. All dies ist aber aufgrund der Komplexität der in Frage stehenden Sachverhalte und Terminologien hier nicht angemessen zu klären, sondern Gegenstand meines genannten umfassenden Forschungsprojekts, auf das ich den geschätzten Leser hiermit verweise.

[10] Natürlich gab und gibt auch Auroville in Indien, und natürlich gibt eine eigenständige französisch-iberisch-lateinamerikanische transdisziplinäre Bewegung. Trotzdem wurde der integrale Impuls erst durch sein Einsickern in den Humus der „jungen" US-Kultur zu einer weltweit rezipierten geistigen

Entscheidend ist, dass sich dieser „integrale“ Willens-Impuls dann ab den 1970er Jahren in einer folgenreichen historischen Spaltung

1. In die eher erfahrungsorientierten, aber anti-wissenschaftlichen (und dabei durchaus sehr unterschiedlichen) „New-Age“-Strömungen einerseits (de-reflexive Substanz-Strömung der gesellschaftlich enttäuschten „Spirituellen“, die sich in das angeblich „rein Geistige“ zurückzogen und damit das öffentliche Bild von „fortschrittlicher“ Erfahrungs-Spiritualität gegenüber der traditionalistisch-hierarchischen Glaubens-Spiritualität der Kirchen zu bestimmen begannen),
2. Und in die eher erfahrungsfremde, aber wissenschaftlich-kritische „Postmoderne“ andererseits (reflexive Nominalismus-Strömung der progressiven links-intellektuellen Impulse seit 1979 - dem Jahr von Jean Francois Lyotards namensgebendem Buch „Das postmoderne Wissen“ -, welche das säkular-emanzipative Paradigma der Universität und des anerkannten kulturellen Wissens zu bestimmen begannen)

ausdifferenzierte.

Beide: „New Age“ einerseits und „Postmoderne“ andererseits als die zwei antagonistischen Haupt-Epigonen des 1968er Aufbruchs zwischen 1970 und der Jahrtausendwende, haben mit den Terror-Anschlägen fundamentalistischer Extremisten auf das New Yorker Welt-Handelzentrum am 11. September 2001 den Anfang ihres Endes, oder jedenfalls ihres Übergangs in etwas Anderes gefunden. Dieses Ende wurde nicht durch die Anschläge *ausgelöst*, sondern nur *angezeigt*; es war beiden Tendenzen der Ausgestaltung des 1968er Impulses in langwierigen Verfalls-Prozessen bereits seit geraumer Zeit bestimmt.

Was nun seit damals geschieht und derzeit in vollem Gange ist, ist die Auseinandersetzung und gegenseitige Reibung zwischen den Resten der tendenziell schwärmerisch-phantasmatischen „Spiritualität“ des „New Age“ einerseits, den Epigonen der „dekonstruktivistisch“-säkularen ersten Generation der Postmoderne (Jacques Derrida, Jean Francois Lyotard, Michel Foucault, Susan Sontag, Helen Cixous, Richard Rorty) andererseits - und eben den drei genannten „Integralen Bewegungen“, die in avantgardistischer Weise beide Dimensionen verbinden und im Hinblick auf eine wissenschaftlich-reflexive „rationale Spiritualität“ überwinden wollen. In den Berührungen und im Kampf zwischen diesen drei Tendenzen besteht die wesentliche innere geistige Auseinandersetzung der Gegenwart im Bereich progressiver Gesellschaftsströmungen der USA – ein Kampf, der in den USA weit intensiver und härter geführt wird, als er in Europa mit seiner weitgehend eindimensionalen und säkularen Tradition nach dem zweiten Weltkrieg denkbar ist. Diese Auseinandersetzung produziert, derzeit erst noch ganz keimhaft, aber an Intensität zunehmend, weitreichende Errungenschaften für die Entstehung eines neuen, „subjektiv-objektiven“ oder „post-postmodernen“ Kulturparadigmas für die erste Weltkultur des 21. Jahrhunderts – Errungenschaften, die in Europa voraussichtlich erst in den kommenden Jahren, und dann notwendigerweise in anderer Färbung, historischer Traditionslinie und begrifflicher Fassung in den Blick kommen werden.

Ost oder West? Der große Richtungskampf um eine empirische und praktisch-gesellschaftsorienteirte Spiritualität für das 21.

Entwicklungslinie. Zu den historischen Hintergründen,Verflechtungen und Gesetzmäßigkeiten siehe näher mein Projekt „A Global History of Integral Thought“, a.a.O.

Jahrhundert im Innern der US-amerikanischen Kultur der Gegenwart

Bei alledem ist nun ein Aspekt bedeutsam, der nicht übersehen werden darf, wenn die besondere Charakteristik des gegenwärtigen US-amerikanischen Geisteslebens in ihrem inneren Ringen, in Problemen und Chancen richtig aufgefasst werden soll. Dieser Aspekt besteht darin, dass das Selbstverständnis aller drei integralen Strömungen weniger atlantisch, als vielmehr pazifisch ist. Alle drei Strömungen sind am Pazifik verankert (insbesondere in der traditionell „alternativen" und „New-Age" geprägten Bay City Area, ausgenommen Andrew Cohen), der nicht nach Europa, sondern in den östlichen Teil der Welt blickt; und alle drei sind vor allem in ihrem geistigen Kern asiatisch geprägt. Das betrifft weniger die philosophische und tiefenpsychologische Seite, als vielmehr die Induktions-Methodologie sowie die Fachterminologie für jenen Kern spiritueller Erfahrung, welcher das Herzstück aller drei integralen Strömungen darstellt.

Während dies bei Andrew Cohen und A. H. Almaas von vergleichsweise geringerer Bedeutung ist, da ihre Ansätze weniger philosophisch-begrifflich und wissenschaftsterminologisch ausgerichtet sind, ist dieser Umstand bei dem bislang in Ausstrahlung und Systemqualität mit Abstand wichtigsten dieser drei Ansätze: beim philosophisch-wissenschaftlichen Jahrhundert-Entwurf integralen Denkens durch Ken Wilber, von mit ausschlaggebender Dimension. Wilber verwendet in der überwiegenden Mehrzahl nicht seiner philosophischen, wohl aber seiner spirituellen Kern-Begrifflichkeiten asiatische (buddhistische und hinduistische, zum Teil auch alt-tibetische) Terminologien, Unterscheidungsmethoden und Bilder; und er verwendet, mit wenigen Ausnahmen, in der überwiegenden Mehrzahl asiatische Methoden der geistigen Erfahrungsgewinnung und ihrer Interpretation. Was in seinem - aufgrund seines mönchischen Lebens, das sich mit Reisen offenbar wenig verträgt, aber auch aufgrund der Einschränkungen, die ihm seine Immunschwäche-Erkrankung auferlegt, in allen Kernstücken ausschließlich in den USA entstandenen - Werk bislang vollständig fehlt, ist der Kontakt zu den spirituellen Kernbegriffen, Bildern und Riten sowie deren Tradition reflexiver Selbstaneignung seitens derjenigen spirituellen Strömungen, die am Beginn der modernen US-Demokratie standen: des Rosenkreuzertums und der Freimaurerei, aber auch, in späterer Ausprägung, ihrer seit vielen Jahren einflussreichen Misch- und Variantenströmungen (siehe zum Beispiel die öffentlichen Erklärungen der beiden äußeren Widersacher George W. Bush und John Kerry im letzten US-Wahlkampf, beide „nach innen" derselben Gruppe „Skull and Bones" mit Sitz in Yale anzugehören), sowie der Theosophie und der Anthroposophie, die beide ebenfalls bereits traditionell, und in wesentlichen Aspekten aktiv anschließend an die Umfeld-Ströme, eine gewisse Rolle im inklusiven, „subjektiv-objektiven" Geistesleben der USA spielen. Das ist umso erstaunlicher, als Ken Wilbers weltberühmter Buch-Erstling „Das Spektrum des Bewusstseins. Eine Synthese östlicher und westlicher Psychologie" (1977, geschrieben mit 23 Jahren) im Theosophischen Verlag der USA erschien, nachdem es zuvor von 15 anderen Verlagen, darunter zahlreiche auf östliche Weisheit hin orientierte, abgelehnt worden war.

Gerade die stark „pazifische" Innenstruktur des integralen Impulses nun aber scheint seit Jahren ein mit ausschlaggebendes Problem für das Erreichen und Durchdringen des christlich-rosenkreuzerischen Charakters des Gründer-Amerikas und seiner Mainstream-Kultur seitens der genannten drei Avantgarde-Strömungen zu sein – so etwa für die in Zeitdauer und Ausmaß ungewöhnlichen Schwierigkeiten Wilbers, eine eigene Universität zu akkreditieren, aber auch für seine seit der zweiten Hälfte der 1990er Jahre offenbar nicht enden wollenden Probleme, die soziale, politische und gesellschaftliche Realität seines Landes in Gestalt seiner eigentlichen Zielgruppe: der „kulturell kreativen“[11] Bevölkerungsschichten zu erreichen. Es ist in dieser Lage eine historische Synchronie, dass um die amerikanische Mainstream-Kultur und ihre geistig-okkulte Ausrichtung seit einiger Zeit ein erbitterter öffentlicher Streit vor allem im Gefolge des Buchs „Who are we? Die Krise der amerikanischen Identität“(2004) von Samuel P. Huntington ausgebrochen ist. Huntington ist ein sich ausdrücklich und aktiv im Strom der rosenkreuzerischen Gründer-Impulse Amerikas verankernder „spirituell-pragmatischer“ Jahrhundert-Stratege der weiteren Entwicklung, der in elitären Gruppen steht, welche traditionell in Jahrhunderten menschheitlicher Bewußtseins-Evolution denken, von einem nicht nur politisch und militärisch, sondern vor allem geistig für die gesamte Menschheit und ihre Bewusstseinsentwicklung notwendigen Primat der US-Zivilisation für die kommenden Jahrhunderte ausgehen, und aufgrund dieser Denkweise, die sich sehr von dem säkularen „Denken in Wahlperioden“ der europäischen Nachkriegs-Politik unterscheidet, von großem Einfluß auf langfristige Hintergrund-Veränderungen sind. (Vgl. dazu im Detail u.a. die Veröffentlichungen von Bill Clintons Lehrer, dem Arnold Toynbee-Schüler Caroll Quigley, 1910-1977, Professor an der einflussreichen Georgetown-Universität Washington, zum Beispiel sein bekanntestes Werk: „Tragedy and Hope,“ 1966, oder „The Anglo-American Establishment. From Rhodes to Cliveden”, posthum 1981).

Warum soll dieser Aspekt aus ideengeschichtlicher Sicht aber für eine Beurteilung des heutigen US-amerikanischen Geisteslebens, und insbesondere der Tätigkeiten und Strahlkraft der progressiv-integralen Bewegungen in ihm, bedeutsam sein?

Während die drei genannten integralen Impulse noch vergleichsweise übersichtliche Anhängerschaften aufweisen, gibt es in den USA heute auch eine innovative anthroposophieorientierte Strömung, die Rudolf Steiner auf zeitgemäße Weise - in Teilen zeitgemäßer als in Europa, weil vergleichsweise weniger befangen - heute „einfach noch einmal macht“. Siehe z.B. den philosophiehistorischen Bestseller des Philosophie- und Psychologie-Professors Richard Tarnas: „Idee und Leidenschaft. Die Passion des westlichen Denkens“ (1991), der in Grundmotiv und rotem Faden nichts anderes ist als Steiners „Rätsel der Philosophie“ (1913/14) noch einmal von heute aus gesehen, und zwar unter brillantem Einschluß der Entwicklung seit Steiners Tod, insbesondere des 1968er Impulses und der „postmodernen“ Epoche. Unter den Initiativen, die Europa-nahe *und* integral sind, ohne einer der drei oben genannten integralen Strömungen anzugehören, ragt das Californian Institute for Integral Studies (CIIS, siehe www.ciis.edu) heraus. Es handelt sich um eine US-weit anerkannte Privat-Universität, die der Verbindung zwischen traditioneller akademisch-philosophischer Welt, klinisch-psychologischen (vorwiegend transpersonalen) und spirituellen Ansätzen, insbesondere im Rahmen kosmologischer und Bewusstseins-Studien, gewidmet ist. Unter der Leitung des Anthroposophen und führenden Steiner- und Aurobindo-Herausgebers Robert McDermott und unter maßgeblicher philosophisch-intellektueller Einflußnahme von Richard Tarnas vergibt die Universität, die derzeit etwa 1500 Studenten zählt, reguläre Master-Abschlüsse (MSc’s) und Doktorate (PhD’s) unter anderem in Klinischer Psychologie, Philosophie und Bewusstseinsstudien, aber auch in traditionellen Fächern. Das CIIS wurde historisch aus der integralen Bewegung Sri Aurobindos heraus begründet und entstand 1951 als Institut für

---

[11] Vgl. dazu näher P. Ray and S. Anderson: The Cultural Creatives, New York 2000; sowie meine 7-teilige Buchreihe „Postmaterialismus – Die zweite Generation“ im Passagen Verlag Wien (2001-2005): www.passagen.at/autoren/benedikter.html.

Asienstudien, wurde aber zwischen 1968 und 1974 von dem Aurobindo-Anhänger Haridas Chaudhuri, einem in die USA emigrierten Bengalen, unter Förderung einflussreicher Rosenkreuzer- und Freimaurer-Kreise zu einem „Institut für Ost-West-Psychologie“ und später zu einem „Institut für Integrale Studien“ umgeformt. Seit dem wachsenden Einfluß des Anthroposophen Robert McDermott in den 1990er Jahren integriert es auch die Anthroposophie Rudolf Steiners sowie verschiedene Ansätze der europäisch-westlichen Tradition immer aktiver mit, darunter das Rosenkreuzertum und verschiedene Strömungen der Freimaurerei, der Kosmologie und der Alchemie, aber auch die proto-spirituellen Ansätze der späten „Postmoderne“ (vgl. dazu näher mein Buch: „Postmodern Spirituality. How To Find A Rational Alternative To The Global Turn To Religion? Dimensions, Developments and Perspectives. An Official Publication of the International Civil Society Initiative for the UN-Decade ‚Education for Sustainable Development 2005-2014’, Section Austria“, in Vorbereitung für 2007) in zwar prinzipiell affirmativer Weise, aber dabei zugleich auf explizit wissenschaftlich-kritischer Grundlage. McDermott und Tarnas haben sich inzwischen, ebenso wie das gesamte CIIS, mit Ken Wilber aufgrund seines Vorwurfs, sie führten den Begriff „integral“ zu Unrecht oder gar in „New Age“ ähnlicher, regressiv-undifferenzierter Manier überworfen. Dabei war Ken Wilbers zweite, über alles geliebte und auf tragische Weise früh verstorbene Frau Treya, der er sein berührendstes Werk, den autobiographischen - und in zentralen Teilen in Dialogform zwischen den zwei Tagebüchern der Eheleute geschriebenen - Welt-Bestseller „Mut und Gnade“ widmete (1991; bis heute das meistgelesene, und am meisten zu empfehlende, einführende Buch zu seiner Weltanschauung), Studentin am CIIS. Tragik und schicksalhafte Verquickung allerorten.

Neben diesen innovativ-transdisziplinären und transspirituellen Ansätzen gibt es aber auch eine sichtbare „klassische“ Anthroposophie, vertreten unter anderem vom ehemaligen Generalsekretär der Anthroposophischen Gesellschaft in den USA, dem weltbekannten Experimentalphysiker Arthur Zajonc, der seit Jahren mit dem Dalai Lama und dem Wiener Erfinder der „Teleportation“, Anton Zeilinger, an einer transdisziplinär-integrativen Ausleuchtung der subjektiv-objektiven „Ur-Wirklichkeit der Welt“ forscht. Es ist nicht zuletzt maßgeblich den geistigen Differenzen zwischen östlichen und westlichen Begrifflichkeiten, Bildwelten, Erfahrungswegen und Interpretationsrastern mit geschuldet, dass Zajonc, der ursprünglich den erziehungswissenschaftlichen Bereich des Integralen Instituts Ken Wilbers mit begründete, sich mittlerweile im Streit von Wilber abgewandt hat. Die wiederholte Äußerung Wilbers, die östlichen Traditionen des Geistes und die westliche Psychologie hätten das „mythische Bewusstsein“ Steiners überholt, aber auch dessen neuere Überzeugung, dass die Zukunft der Spiritualität nicht in ontologischen geistigen Hierarchien, sondern *ausschließlich* in der Unterscheidung qualitativer innerer Bewußtseinszustände bestehe, waren keine Hilfe für den Dialog und den Anschluß von Wilbers integraler Bemühung an den anthroposophisch-theosophischen Strom der USA, der seine Werke ursprünglich mit besonderem Enthusiasmus und in aktiver Förderung aufgenommen hatte.

Drittens gibt es, und das ist von besonderer Bedeutung, in den heutigen USA als unzweifelhaften, eindeutigen und mit großem Abstand einflussreichsten Schwerpunkt der erfahrungsgestützten traditionellen Ströme abendländisch-„wissenschaftlicher“ Spiritualität und ihrer gesellschaftlich-sozialen und politischen Wirksamkeit etwa 5,5 Millionen Freimaurer, den überwiegenden Teil ihrer Weltpopulation, und zwar mit deutlichem Schwerpunkt Rosenkreuzerstrom – Politik. Praktisch alle führenden Persönlichkeiten der heutigen USA sind darin Mitglied oder haben intensive Beziehungen dazu - keineswegs nur die bereits genannten Huntington, Bush oder Kerry. In den USA hat sich historisch – so wie im gesamten anglo-amerikanischen Bereich, wo Anfang des 14. Jahrhunderts (1307-1314) der Templerorden als einziger Weltgegend bewusst *nicht* ausgerottet wurde (Schottland), was den Aufstieg des Angelsachsentums, der „Thin Red Line“, zur Weltherrschaft im19., 20. und 21. Jahrhundert maßgeblich mit impulsierte und stützte – der „alte and angenommene schottische Ritus“ durchgesetzt. Das heißt: Es haben sich hier die „Geist-Realisten“ unter den heutigen, seit dem zweiten Weltkrieg weltweit zwischen Realismus und Nominalismus zweigespaltenen Freimaurern mit großer Mehrheit (und qualitativ nicht vorrangig im Denken oder im Gefühl, sondern auf der Willensebene) durchgesetzt. Dies ganz im Unterschied zu Kontinental-Europa, wo der Templer-Orden historisch unter Philip dem Schönen vernichtet wurde und sich, auch im Gefolge dieser Tat, sowie unter dem Einfluß der Erfahrung der Totalitarismen des 20. Jahrhunderts, nach dem zweiten Weltkrieg bis heute der „Großorient“, das heißt die „Nominalisten“ bzw. die kantianisch-anti-gnostischen und säkularen Strömungen quantitativ und qualitativ durchgesetzt haben. Während erstere die Riten als Realität eines geistigen Ereignisses pflegen, betrachten letztere sie hauptsächlich als Übung guten Willens, und in weiten Teilen nur mehr als halb-mythische Folklore, die in ihrem Kern inzwischen durch die historische Aufklärung überwunden ist.

Der spirituelle Realismus der US-Freimaurerei auf der Grundlage eines stark rosenkreuzerischen Einschlags ist einer der Haupt-Gründe, warum sie zahlenmäßig sowie im Hinblick auf den öffentlichen Einfluß nach wie vor eine große Rolle spielt – beides ganz im Unterschied zu den europäischen Strömungen. Sie ist zweitens ein Haupt-Grund dafür, daß sich im anglo-amerikanischen Bereich, mit Zentrum der heutigen welthistorischen Achse USA-Großbritannien, eine weit engere strukturale Verquickung zwischen erfahrungsorientiert-„subterranen“ und konfessionell-kirchlichen spirituellen Strömungen etablieren konnte – mit viel umfassenderen Möglichkeiten wechselseitiger Einflussnahme und strategischer Koalitionen. Diese charakteristische Verquickung verschiedener „realistischer“ christlicher Ströme, die am Ursprung der USA steht und bis heute einen wesentlichen Aspekt ihres geistigen Zentrums darstellt, wird noch heute jedem aufmerksamen Besucher zum Beispiel bereits an der äußeren, und noch mehr an der inneren Symbolik des Washingtoner Sitzes des US-Parlaments, des „Capitols“, nachvollziehbar. Dort finden sich allenthalben ganz offen rosenkreuzerische Symbole (das heißt in der Interpretation der US-Väter: Symbole der Vereinigung griechisch-römischer - oder „subjektiv-objektiver“ – Geisttraditionen zum „im Willen denkenden“ Christentum). Sie verweisen auf die Kern-Inspiration der amerikanischen Verfassung von 1776, deren Geist bis heute die US-Gesellschaft allenthalben unsichtbar durchdringt und bis ins Innerste prägt. Aber nicht nur am Kapitol, sondern überall im öffentlichen Leben findet sich jene starke Koalition der christlich-freimaurerischen Ströme mit den großen etablierten Glaubens-Kirchen, die auf den durchdringenden Einfluß der europäisch-westlichen okkulten Traditionen hinweist. Man betrachte, nur ein Beispiel unter vielen, die zentralen Kirchen in Philadelphia, dem geistig-institutionellen Ursprungsort der USA (der quäkerische Name der Stadt lautet wörtlich: „Liebe zur Brüderlichkeit“), und man sehe dort die unbefangene Verquickung von katholisch-protestantischem Kreuz und freimaurerischem Zirkel auf *derselben* Kirchenwand! Genau dies ist der okkulte Kern des US-Willenselementes, welches die erste moderne demokratische Gesellschaft der Welt mit der Mission hervorgebracht hat, dass sich in ihr der zunächst individuelle Wille zum „objektiven“ Wahrnehmungs- und Urteilsorgan ausbilden kann, um als „subjektiv-objektiver“ Denkwille *in* der Welt zu wirken. Eine ganz andere Grundhaltung als die Konzeption der „Leere“ in den asiatisch-östlichen Strömungen, die im Zentrum der drei genannten integralen Impulse von Ken Wilber, Andrew Cohen und A. H. Almaas stehen (wobei

Cohen am weitesten eine „Hinwendung zur Welt im Ich“ im innersten Kern seines Praxis- und Denk-Systems etabliert hat, weshalb er heute vielleicht als der „Atlantikfähigste“ der drei „Pazifiker“ gelten kann). Etwas Ähnliches und direkt Verwandtes von welthistorischer Bedeutung politisch-spiritueller Natur findet sich auch im Herzen des „Outback“ Australiens, etwa in den zentralen Kirchen von Alice Springs. Die in jeder Hinsicht stark „objektivistisch“ gefärbte angelsächsische Welt praktiziert überall einen pragmatischen Geistrealismus, keinen Nominalismus, und die USA als ihr heutiges Machtzentrum halten diese Traditionen am lebendigsten, da sie genau wissen, dass von ihr ihr „reflexiver Idealismus“, aber auch die innere Lebensfähigkeit ihrer weltpolitischen Mission abhängen. Es kann kein Zweifel daran bestehen, dass die solcherart auch in das konfessionelle, soziale und politische Umfeld eingedrungenen geistrealistischen Ströme und Motive im Halb-Untergrund nach wie vor eine große Kraft entfalten und überaus lebendig sind – auch dies im Unterschied zum heutigen Europa. Warum? Weil diese Strömungen in den USA im Zeichen von „Kontinuität und Wahrheit“ traditionell weniger den *Ätherleib* (Steiner: „Einen Freimaurer erkennen Sie an der Kultivierung seines Ätherleibs“), sondern eher den *physischen* oder *Willensleib* spirituell kultivieren.

Zwischen letzteren – Anthroposophie und Freimaurertum, sowie dem (nicht zuletzt auch sozialen und politischen) Erstarken gewisser gemäßigt-konfessioneller Strömungen vor allem im Rahmen der Republikanischen Partei, der „gran old party“ (Bill Clinton, siehe seine Autobiographie: Mein Leben, Berlin 2000) – einerseits, und den drei führenden integralen Strömungen – Wilber, Cohen, Almaas – andererseits gibt es nun derzeit einen weitreichenden Konkurrenz- und Richtungskampf um die weitere Entwicklung des US-amerikanischen Spiritualitäts- und Kulturparadigmas. Dieser Richtungskampf besteht in der Applikation zweier verschiedener Färbungen, da die ersteren christlich-atlantisch, die letzteren asiatisch-pazifisch ausgerichtet sind. Beide bringen daher unterschiedliche ideengeschichtliche Linien und Traditionen in die innere Fermentierung des traditionell eher „realistischen“ US-Geisteslebens ein. Dabei haben es die heutigen drei integralen Strömungen weit schwerer, da ihre Linien weit weniger in der US-amerikanischen Leit-Kultur verankert sind. Und obwohl es in den USA seit jeher eine weit stärkere interkonfessionelle und transspirituellen Kooperation zwischen Ost und West als in Europa gibt, bleibt sie hier bisher in vielen Fällen weniger nachhaltig. Das ist mit ein Grund dafür, warum die wechselseitige Rezeption und Durchdringung zwischen den genannten „atlantischen“ und „pazifischen“ Richtungs-Strömungen bisher noch wenig erfolgt ist. Die große Frage für das US-amerikanische Geistesleben ist, ob und in welcher Weise das in den kommenden Jahren überhaupt erfolgen kann, da christliche und asiatische Weltanschauungen zwar zum Großteil dasselbe wollen und in vielen Aspekten komplementär zueinander stehen, sich also wechselseitig bereichern und ergänzen können gerade durch verschiedenartige reflexiv-terminologische und bildhafte Fassungen desselben, sich aber auch in wesentlichen Teilen ihrer „Wege“ widersprechen oder sogar gegenseitig ausschließen. Wenn der deutlich in den „atlantischen“ Strömungen verankerte, ehemalige „Rhodes“-Stipendiat und Quigley-Schüler Bill Clinton neuerdings, wie etwa auf dem Weltwirtschaftsforum Davos im Januar 2006 geschehen, öffentlich das integrale Denken Ken Wilbers promotet, dann ist das bisher einer der wenigen Fälle von öffentlichem Brückenschlag nachhaltiger und langfristig gemeinter Natur; dass zugleich Wilbers Integrale Universität noch immer nicht anerkannt ist, kann auf der anderen Seite als Symbol bisherigen Probleme gelten, den öffentlichen Mehrheits-Mainstream der US-Kultur in seinen Tiefenschichten zu erreichen.

Das Fehlen der Mitte. Die Bedeutung des Richtungskampfs um eine progressiv-integrale US-amerikanischen Spiritualität zwischen historischer Nähe und geistigem Antagonismus zu Europa

Die drei integralen Haupt-Strömungen des gegenwärtigen US-Geisteslebens (Ken Wilber, Andrew Cohen, A. H. Almaas) sind solcherart in einen dreifachen Richtungskampf verwickelt: Einmal in die Abgrenzung zu New Age und traditioneller Religion; zweitens in die Abgrenzung und Anbindung an die etablierte Philosophie und Wissenschaft sowie die kritisch-integrative Fortführung der „Postmoderne;" drittens in die latenten Diversifizierung zwischen „atlantischen" und „pazifischen" Ansätzen.

Ein zentrales Problem vor allem bei letzterem Richtungskampf scheint: Es ist bisher ein Kampf zwischen Ost und West. Die geographisch-historische Mitte, nämlich Europa und seine eigenständigen geistig-okkulten Traditionslinien, ist bislang darin kaum vertreten. Doch Ost und West sind ohne ihr Drittes: ohne die Mitte deutlich unvollständig. Und ein direkter Brückenschlag zwischen ihnen ohne Vermittlung der Mitte und ihrer spezifischen Geistigkeit und Sozialität muss laut Rudolf Steiner in vielen Fällen scheitern. Europa ist bisher in der Debatte um eine neue spirituelle Leitkultur für die USA und „den Westen" insgesamt nicht angemessen präsent; eher handelt es sich der Färbung nach um einen US-internen Kampf – dessen Ergebnisse aber, wie alles, was von der einzigen verbliebenen Weltmacht USA heute ausstrahlt, mit unabsehbaren Folgen für die gesamte europäisch-westliche Welt sein werden. Daher sind diese scheinbaren „kleinen" oder „unterschwelligen" oder „nebensächlichen" Kämpfe von größter Bedeutung und müssen genau verfolgt werden – nicht nur aus ideengeschichtlicher, philosophie- und kulturhistorischer, sondern auch aus sozial- und zeitpolitischer Sicht.

Denn vergessen wir es nie: Die Amerikaner sind Meister im Geschichtenerzählen mit Bildern, inneren und äußeren. Diese bilden auf dem amerikanischen Kontinent eine Einheit der Willens-Imagination (mythisch strukturierter amerikanischer Traum). Von dort aus haben sie medial und geistig-kulturell längst den Innenraum der Welt erobert so, wie die US-amerikanische Zivilisation seit dem zweiten Drittel des 20. Jahrhunderts die äußere Weltherrschaft erobert hat. Die Eroberung der Welt geschieht im 21. Jahrhundert mittels Bildern. Die heutige, im Untergrund noch immer mehr „geistrealistische" als „nominalistische" US-Kultur ist die Erobererin der Welt mittels Imaginationen; und die USA als darauf aufbauendes politisch-gesellschaftliches Gebilde sind diejenigen, die diese Imaginationen strukturieren und ihre Färbung und Gehalt vorgeben (Jean Luc Godard). Die USA haben aber nicht nur die kulturelle, sondern auch, gerade wegen ihres seit dem britischen „Round Table" des 19. Jahrhunderts gepflegten Jahrhundert- und Globaldenkens, die politisch-ökonomische und die militärische Weltherrschaft inne, und manche sagen nicht zu Unrecht, eben in diesem Gefolge auch die religös-spirituelle: verstanden als Herrschaft einer bestimmten Bewusstseinsform, eines bestimmten Ich-Erlebens und seiner spezifischen gesellschaftlichen Organisationsform, der in ihren Basis-Idealen „geistrealistisch informierten" säkularen Demokratie. In jedem Fall werden die USA auf der Grundlage ihrer bestimmenden Einflussnahme auf allen Gebieten - trotz vorhersehbaren Niedergangs oder zumindest Verschiebung gewisser Kernelemente ihres heutigen Status (etwa des absehbaren Endes der Dollar-Hegemonie; siehe dazu näher mein Buch „Globale Paradigmen-Verschiebung. Wirtschaft, Kultur, Politik", mit einem Vorwort von Ernst Ulrich von Weizsäcker; in

Vorbereitung) - die weltweite Entwicklung und das Selbstverständnis progressiv-rationaler Spiritualität, welche allein zur Überwindung des Kampfs der Kulturen fähig sein wird, maßgeblich mit prägen.

Wenn wir also heute genau im Schnittpunkt zwischen Pazifik und Atlantik einen Willen haben, der „wahrnehmend“ wird in einer noch immer stark sozialdarwinistisch, religiös und phantasie-spirituell geprägten Gesellschaftsumgebung, dann müssen wir uns doch als Europäer jederzeit bewusst sein, dass es sich um einen im Kern zutiefst moralischen Willen handelt, der wahrnehmend und zur Erkenntnisform wird, und der derzeit darum ringt, ob dies in phantasmatisch-regressiver oder wissenschaftlich-progressiver, und ob es in atlantischer oder in pazifischer Färbung der Fall sein wird.

Noch einmal: Man darf, wenn man die Zukunft der genannten drei integralen Impulse abzusehen sucht, die heute zu den einflußreichsten ideengeschichtlichen Neuerungen weltweit gehören und von deren Schicksal manches abhängen wird, nie vergessen, dass die USA aus rosenkreuzerischen Impulsen begründet wurden, und dass sie in ihrer inneren biographisch-gesellschaftlichen und geistigen Dialektik immer schon im inneren Gespräch zwischen Idealismus und Pragmatismus gelebt haben: beide leben im Willen.

Wenn die bislang stark „pazifischen“ integralen Strömungen diesen Grund US-amerikanischen Geisteslebens vollends erreichen wollen, benötigen sie eines: die Einbeziehung der Mitte, die Integration der europäischen Ströme geistrealistischer *und* rationaler Spiritualität und ihrer wissenschaftlich-philosophischen Begriffsterminologie. Darin besteht ihre Chance, die Brücke zwischen Pazifik und Atlantik zu schlagen und einen verbesserten Zugang zum Hauptstrom ihrer Kultur zu gewinnen, ohne ihre eigenständigen, neuartigen Charakter preiszugeben. Europäisierung ist deshalb die große Anforderung. Doch bestehen solche Bezüge heutiger progressiver US-amerikanischer Spiritualität zu Europa?

Die Antwort ist wechselhaft. Während Tarnas und auch Cohen stark nach Europa tendieren und dieses als Chance auch für die Entwicklung ihres eigenen Impulses begriffen haben, scheint Wilber bislang nur in ambivalenter Weise daran interessiert. Bezeichnend ist die lakonische Antwort, die er einem der Gründer des „Arbeitskreises Ken Wilber Deutschland“, Gerd Klostermann, 2005 auf die Frage gab, wann Europa stärker in die weiteren Arbeiten von Integralem Institut und Integraler Universität eingebunden werde: „Wenn wir fertig sind.“ Zwar hat Wilbers „Integrales Institut“ inzwischen ein explizites „Outreach-Programm“ nach Europa begründet und führt seit Jahresbeginn 2006 Gespräche über die Abhaltung von Seminaren in verschiedenen europäischen Ländern, was darauf hinweist, dass man begriffen hat, dass die größten nichtamerikanischen integralen Initiativ-Gemeinschaften in Europa zu finden sind. Daß sich diese völlig autonom ohne US-„Abgesandte“ entwickelt haben und den integralen Ansatz mittlerweile eigenständig diskutieren, scheint Wilber zu stärkerer „Kontrolltätigkeit“ in Gestalt von „Exportplänen“ (die ja derzeit in den USA sowohl politisch als auch kulturell und religiös in Mode sind) zu veranlassen.

Wilber scheint sich bislang, im Unterschied zu Cohen und zum Teil auch Almaas, über die Bedeutung der Einbindung jener okkulten Ströme, welcher an der Grundlage der US-Verfassung stehen, noch nicht ausreichend im Klaren zu sein: von Freimaurerei, Rosenkreuzertum und anderen. Ihre Dimension spielt in seinem Werk noch kaum eine Rolle, obwohl von ihnen die Kultur, in der er lebt, abhängt. Deshalb seine Schwierigkeiten, als „Asiate“ an seine eigene dominierende Kultur heranzukommen. Doch von dieser Einbindung wird voraussichtlich ein guter Teil des Schicksals seiner integralen Bewegung und seiner - bisher zweifellos unvergleichlich genialen und weitreichenden - Welt-Philosophie abhängen.

In dieser Lage könnte ein stärkerer Bezug Wilbers zu europäischen Leitströmungen, zum Beispiel der Freimaurerei oder der Anthroposophie, für beide Seiten fruchtbar werden. Ich habe einige Anregungen zu einem solchen produktiven Bezug anhand von ausgewählten Themen und Motiven in meinem Buch „Ken Wilber und die Anthroposophie. Elemente für den Dialog“ (in Veröffentlichung begriffen) zu skizzieren versucht. Müssen sich alle diese in ihrem Anspruch innovativen und „nominalistisch-realistischen“ Ideen-Strömungen - Integrale Bewegung, Freimaurerei und Anthroposophie - in die heutige produktive geistige Komplementärbildung und Ausdifferenzierung zwischen den USA und Europa gestaltend mit hineinstellen? Und wenn ja, in welcher Weise kann dies geschehen?

Seit der Initiative von Jürgen Habermas und Jacques Derrida vom 31. Mai 2003 „Nach dem Krieg – Die Wiedergeburt Europas“ ist auch in Europa eine zusehende Öffnung des kulturellen Leitparadigmas für eine Erweiterung in Richtung progressive Spiritualität zu beobachten, wenn auch die diesbezüglichen Ansätze erst keimhaft sind. Europa braucht hier nun die progressive Anregung aus den heutigen USA, um seine historisch bedingten Tabus zu überwinden (siehe dazu meinen genauere Analyse in meinem Buch: „Postmodern Spirituality. How To Find A Rational Alternative To The Global Turn To Religion? Dimensions, Developments and Perspectives”, erscheint 2007). Und die integralen Strömungen der USA brauchen die kritisch-selbstkritische Haltung Europas, um ihre weitgehend pazifisch-„östliche“ Ausrichtung zu ergänzen und um die „Kontinuität und Wahrheit“ des Abendlandes auszubalancieren. Von den drei genannten integralen Avantgarde-Ansätzen hat dies Cohen bisher vielleicht am besten begriffen. Er hat, wie seine zunehmenden Initiativen und Gastvorträge in Europa zeigen, erkannt, dass gerade unter dem Gesichtspunkt der notwendigen Genese eines subjektiv-objektiven Paradigmas die größten Chancen auf eine kritisch-post-postmoderne Spiritualität genau im Schnittpunkt zwischen den USA und Europa liegen. Die transatlantische Gemeinschaft kritisch-progressiver Spiritualität ist heute mehr denn je die große Zeitforderung – richtig angegangen, nicht im Sinn des Exports oder der wechselseitigen Filialeneröffnung.[12]

---

[12] Eher pessimistisch schreibt mir dazu ein befreundeter Wissenschaftler: „Das ist ein schönes Postulat, aber die Wirklichkeit wird vermutlich weniger dialogisch ablaufen - und zwar vor allem im Sinne eines ready-made US-Exports nach Europa, wo dieser, ähnlich wie nach dem zweiten Weltkrieg die Care-Pakete, empfangen werden wird. In der umgekehrten Richtung: Von Europa nach Amerika sieht es in meinen Augen eher düster aus, so dass in den USA die großen pazifischen und atlantischen Einflüsse, wie du sie beschrieben hast, weiterhin neben- und gegeneinander laufen werden. In Europa natürlich auch, weil einerseits die verschiedenen Länder und Sprachgemeinschaften bisher faktisch erst wenig Austausch untereinander hinkriegen, und zweitens, weil dann die proamerikanischen Export-Importierer und die Amerika-kritischen Kontinental-Europäer mit Besinnungstendenzen auf die eigenen Wurzeln auch nicht mehr miteinander können werden. So wird all dies eher zu neuen Teilungen als zu Integrationen der integralen Bewegungen führen, wenn wir nicht ganz massiv Brücken gebaut werden - und zwar Brücken von dreierlei Art: Innerhalb Europas, innerhalb der USA und über den großen Teich, alle zugleich.“ (Brief an den Autor, September 2006). Obwohl dieser Pessimismus ohne Zweifel seine Gründe in der bestehenden Realität hat, wie etwa die oben erwähnten „Exportpläne“ Wilbers zeigen, halte ich es - gerade deshalb - für entscheidend, diese Realität mittels der Anstiftung eines substantiellen, nicht nur kurzfristig auf „Aktion“, sondern langfristig auf Ausarbeitung und Differenzierung geistig-wissenschaftlicher Grundlagen ausgerichteten Dialogs zu überwinden. Siehe dazu näher meine in Anmerkung 12 erwähnten Publikationsprojekte.

Perspektiven zwischen Postmoderne und Post-Postmoderne: Chancen und Probleme

„Das letzte große Hindernis für einen wirklich integralen Ansatz, wie ich ihn sehe, ist die New-Age-Epidemie, die... nun ja, zum Beispiel Magie und Mythos auf die psychische und subtile Ebene erhebt, Ich und höchstes Selbst verwechselt, prä-rational als trans-rational verherrlicht, prä-konventionelle Wunscherfüllung mit postkonventioneller Weisheit verwechselt, das Ich auf ein Podest stellt und es Gott nennt. Ich wünsche diesen Leuten nichts Böses, bloß eines: Mögen ihre Wünsche so schnell wie möglich in Erfüllung gehen, damit sie selbst sehen, wie wenig damit gewonnen ist.“ (Ken Wilber: Einfach Das. Tagebuch eines ereignisreichen Jahres, Eintragung vom 24. Juni 1997. Fischer: Frankfurt am Main 2001, S. 175).

Fassen wir zusammen. Wir haben gesehen: Die drei progressiv-integralen Avantgardeströmungen heutigen US-Geisteslebens, diejenigen von Ken Wilber, Andrew Cohen und A. H. Almaas, haben ihre Stärke in der kritisch-wissenschaftlichen Begründung einer ganzheitlichen, realistisch-nominalistischen „rationalen Spiritualität“. Sie haben wenig Probleme damit, sich aktiv gegenüber dem „New Age“ und seinen zahlreichen, überaus komplex verwobenen Seiten- und Folgeströmungen abzugrenzen, und zugleich andererseits sinnvolle Freundschaften zu vielen zu pflegen, die als Idole des „New Age“ gelten wie etwa zum gebürtigen Innsbrucker Frithjof Capra und zu seinem „Institute for Ecoliteracy“ in Palo Alto (Bay City Area). Die Gegnerschaft zum New Age macht die drei integralen Ansätze zwar für viele an schnellen Schein-Erfolgen Interessierten zu kompliziert, gerade in den USA mit ihrem Willen zu „action and satisfaction“ auch auf diesem Gebiet. Auf der anderen Seite gelingt es diesen Strömungen aber auch, dadurch an Profil zu gewinnen und immer mehr wirklich Interessierte auf ihre Seite zu ziehen; darüber hinaus geben sie damit den verbleibenden Resten des „New Age“ einen selbstkritischen Impuls, der von diesen längst benötigt wird.

Die Herausforderung für diese drei Ansätze besteht heute eher darin, in ihre vorwiegend „pazifische“ Grundierung die abendländisch-„atlantischen“ Traditionslinien aktiv zu integrieren. Dabei ist diese Herausforderung von je unterschiedlicher innerer und äußerer Bedeutung. Während sie bei Cohen und Almaas aufgrund ihrer starken Praxisorientierung und ihres nicht primären Wissenschaftsanspruchs weniger ins Gewicht fällt, ist dies bei dem ausdrücklich philosophisch-wissenschaftsorientierten Anspruch Wilbers auf die historisch fundierte Vorbereitung und Herausarbeitung einer ersten echten Weltphilosophie ein möglicherweise wesentlicher Kern-Aspekt für die weitere „Einbildung“ seines Impulses in die US-amerikanische Kultur. Es ist bislang ein faktisches Struktur-Problem mit potentiell weitreichenden Konsequenzen, dass ein Großteil seiner nicht-psychologisch-spirituellen Kern-Terminologie sowie sein geistiges Selbstverständnis weitgehend asiatisch-pazifisch geprägt sind. Und es ist ein Versäumnis von möglicherweise weitreichenden Folgen, dass Wilber bislang trotz seines Anspruchs auf Integration aller Weltströmungen zwar die großen Philosophien des Abendlandes sowie die Psychologie und die Sozialwissenschaften einbezieht, aber praktisch vollständig die geistigen Strömungen ignoriert, die in demjenigen geographischen Bereich bestimmend waren und bis heute sind, in dem er arbeitet: Rosenkreuzertum, Freimaurertum, Theosophie, Anthroposophie, um nur die wichtigsten zu nennen. Denn die meisten einflussreichen Menschen gerade in den USA stehen in diesen Traditionen.[13]

---

[13] Nach 1989-91, und verstärkt nach dem 11. September 2001, scheint für die weitere Entwicklung der modernen Demokratie, aber auch der progressiven Weltgesellschaft insgesamt eine freundschaftlich-

Welches Fazit können wir aus geschilderten Situation des heutigen US-amerikanischen Geisteslebens ziehen? Und wo liegen die Perspektiven?

Ich möchte dazu *fünf* meines Erachtens wesentliche Punkte hervorheben, die zugleich fünf grundlegende *Herausforderungen* darstellen:

Aus ideengeschichtlicher Sicht ist *erstens* bedeutsam der zwar philosophisch-theoretisch gegebene, faktisch aber kaum vorhandene Bezug der drei genannten Avantgarde-Strömungen zur geistigen Kontinuität ihres historisch-geographischen Umfelds. Deshalb kann man in allen drei Fällen bisher faktisch eigentlich nicht oder nur teilweise von einer angemessenen ideengeschichtlichen Einbettung sprechen. Diese wird bislang bei allen drei Ansätzen eher äußerlich durch freundschaftliche Verbindung zu Partnern und mittels der mehr oder weniger kontinuierlichen und umfassenden Einbindung von Dialog-Partnern aus angrenzenden Strömungen hergestellt - beim Zen-Buddhisten Wilber zum Beispiel seitens des konfessionellen Christentums -, denn im inneren geistigen Kernstrom. Das kann in mancherlei Hinsicht ein Vorteil sein; es bleibt aber zu reflektieren, was das aufs Ganze besehen bedeutet.

Zweitens: Strukturdynamisch sind alle drei integralen Zukunfts-Ansätze von großen Pionieren getragen, die alle drei noch leben und maßgeblichen Einfluß auf Wirklichkeit und Impuls ihrer Bewegung in praktisch jedem Detail nehmen. Das bringt im Hinblick auf die soziale, aber damit zusammenhängend auch spirituelle Wirklichkeit dieser Impulse alle Stärken und Schwächen einer Pionierphase mit sich, die in allen drei Fällen unübersehbar sind, und aufgrund ihrer dabei zum Teil kultischen Kulturbildungen, die in europäischen Augen manchmal fragwürdige Erscheinungen produzieren mögen. Die Frage ist, wie es mit diesen Ansätzen nach der Pionierphase weitergehen kann, und wie sie auf ein breiteres Fundament in der internationalen Wissenschaftsszene zu stellen sind.

Drittens: Alle drei Strömungen sind Ausdruck des großen immanenten Ringens zwischen spiritueller Phänomenologie und „säkular-„dekonstruktiver“ Subjektkritik in der gesamten zeitgenössischen europäisch-westlichen Kultur um eine angemessene, zukunftsweisende Integration in Richtung eines „subjektiv-objektiven“ neuen Paradigmas, das als Voraussetzung für die weitere positive Evolution der Bewußtseinsentwicklung der Menschheit angesehen wird. Der Versuch der Synthese von postmodernem (De-)Konstruktivismus mit spiritueller Phänomenologie der Traditionen birgt die Chance auf den tatsächlich großen Durchbruch zu der Weltanschauung, die das 21. Jahrhundert benötigen wird: die subjektiv-objektive Weltanschauung, die zum Beispiel genau und präzise im Werk des jungen Steiner, insbesondere der Philosophie der Freiheit und ihrer Vorläuferschriften, in kongenialer Art grundgelegt ist. Die Frage, wie spirituelle und „postmoderne“ Weltbilder und Erkenntnis-Systeme angemessen zu integrieren sind, ist aber derzeit noch ein offener, in vollem Gange befindlicher Prozeß, der in den kommenden Jahren auf einer breiteren Basis als bisher stattfinden und vor allem die späten

---

produktive und aktiv komplementaritätsorientierte Ausdifferenzierung zwischen den USA und Europa nicht nur auf politischem, sozialem und kulturellem, sondern auch auf *geistigem* Gebiet notwendig. Zu den komplexen und vielschichtigen Dimensionen dieser Ausdifferenzierung siehe näher die - allerdings erst noch ganz anfänglichen - Dialog-Versuche meines Buches „Ken Wilber und die Anthroposophie. Elemente für den Dialog“ (in Vorbereitung), aber auch mein Buch „Demokratie für den Irak? Sozio-kulturelle und demokratiepolitische Perspektiven“ (Wien 2005), welches zwei (affirmativ-kritische) Kapitel zu Ken Wilber und zur produktiven Differenzierung Europa-USA in kulturpolitischer Makro-Perspektive enthält; sowie mein in Vorbereitung befindliches Buch „Globale Systemverschiebung. Indizien eines Paradigmenwandels in Politik, Wirtschaft, Kultur, Religion auf Weltebene“ (Arbeitstitel; mit einem Vorwort von Ernst Ulrich von Weizsäcker).

„proto-spirituellen“ Tendenzen der Hauptvertreter der „Postmoderne“ wie Jacques Derrida, Jean Francois Lyotard oder Paul Feyerabend kongenial einbeziehen wird müssen, um seine volle Wirksamkeit kraft Durchdringung auch des akademischen und universitären Bereichs zu erreichen. Das ist derzeit noch nicht ausreichend der Fall. Insbesondere in den jüngsten Stellungnahmen Wilbers dominiert ein stark konfrontativer bis abwertender Ton („Derrida ist tot, und die Zeit der postmodernen Halbstarken, die alles niedermachten und zerstörten, ohne etwas an seine Stelle zu setzen, ist damit endgültig vorbei“), der wenig für die Integration des die Epoche zwischen 1979 und 2001 dominierenden „postmodernen“ Bewusstseins geeignet erscheint.

Viertens: Alle drei integralen Strömungen sind Teil einer integrativen Utopie, die im Vergleich zu den Gründungsimpulsen der USA seit Anfang der 1970er Jahre sehr weitgehend von institutionell-äußeren System-Ansätzen nach innen, zur Entwicklung des Subjekts übergegangen ist. Alle drei stellen die Handlungsebene des Subjekts weit stärker in den Mittelpunkt als die Systemebene, die Eben der Weiterentwicklung der äußeren Grundlagen von Gesellschaft und Demokratie. Sie konzentrieren sich hauptsächlich auf das Bewusstsein des Einzelnen, nicht auf die Veränderung der Systemkomponenten der Gesellschaft. Mit anderen Worten: Sie wollen nicht das US-amerikanische Demokratiesystem als solches entwickeln (das kommt Amerikanern schon traditionell-kulturbedingt wenig in den Sinn), sondern setzen alles auf die „integral informierte Persönlichkeit“, die dann in Wirtschaft, Kultur, Politik und Spiritualität Veränderungen aus subjektiver moralischer Intuition vollziehen soll. Die „Kraft der Utopie“, die am eindeutig atlantischen spirituellen Ursprung der USA als *gesellschaftliche* Vision steht, ist hier in eher pazifischer Art *verinnerlicht* und zu evolutiven Bewusstseinsstufen geworden. Doch aus dem Gesichtspunkt des untrennbaren Zusammenhangs zwischen Ideengeschichte und Demokratie ist die Weiterentwicklung der US-amerikanischen Demokratie heute notwendig - nicht erst seit dem Sieg Bushs über Gore aufgrund des defizitären Wahlsystems oder Huntingtons prekärer Identitäts- und Einheits-Debatte „Who are we“?, sondern auch wegen dem wachsenden Einfluß des „militärisch-industriellen Komplexes“, vor dem bereits Präsident Eisenhower in seine berühmten Abschiedsrede gewarnt hatte, und der wachsenden neokonservativen Tendenz zu einem gesellschaftlichen Unitarismus. Die Herausforderung an die drei integralen Strömungen wird des diesbezüglich in den kommenden Jahren sein, eine genaue Differenzierung zwischen „Unitarismus“ und „Integration“ vorzunehmen und zur systemischen Ausdifferenzierung der gesellschaftlichen Ur-Sphären Wirtschaft, Politik, Kultur und Spiritualität auch auf Systemebene beizutragen.

Fünftens: Insgesamt und zusammenfassend gilt: Auf dem Gebiet der drei genannten integralen Strömungen von Ken Wilber, Andrew Cohen und A. H. Almaas bringen die USA in kritischer Absetzung zum „New Age“ und in Fortbildung der „Postmoderne“ aus ideengeschichtlicher Sicht einige der fortschrittlichsten, hoffnungsvollsten und weitreichendsten Impulse für das 21. Jahrhundert zutage - wenn diese auch, wie nicht anders möglich, noch mit einigen undurchschauten Lokalbedingtheiten behaftet sind. Das Studium dieser drei Ansätze muss allen an den zukünftigen Chancen und Wegen von Welt-Spiritualität Interessierten auch in Kern-Europa wärmstens empfohlen werden. Insbesondere das Werk von Ken Wilber ist ein konkreter Schritt hin zur Entstehung einer ersten echten Weltphilosophie und einer neuen, „subjektiv-objektiven“ Wissenschaft, für die es bisher kaum vergleichbare Ansätze gibt. Es dürfte zu den wichtigsten und richtungsweisendsten am Beginn des 21. Jahrhunderts gehören, und es müsste deshalb gerade von all jenen, die an dem philosophisch-wissenschaftlichen Werk des jungen Rudolf Steiner interessiert sind, zur Pflichtlektüre gehören. Die Begegnung mit diesen drei grossen Strängen wirklicher Zeit-Avantgarde der heutigen USA ist aber auch allen empfohlen, die an einer kulturellen Komplementärbildung und vertieften geistigen Integration durch freundschaftliche Differenzierung zwischen den heutigen USA und dem werdenden Europa interessiert sind.[14]

Beide haben zur hier vorliegenden Darstellung mittels produktiver Kritik wesentlich beigetragen.

Of Syntheses and Surprises: Toward a Critical Integral Theory

Daniel Gustav Anderson

Abstract: The central concern of this article is how the search for formal structures with universal values functions ideologically, addressing Zizek's claim that East-West syntheses may represent the dominant ideology *par excellance* of global capitalism. To this end, the article offers a Foucaultian genealogy of Integral theory, tracing its origins to the cultural and subjective contingencies of the British Empire, primarily in the work of Integral theory's foundational thinker, Aurobindo Ghose. The article poses a primary critique of synthesis and evolution as mythological keys to Ultimate Reality which suggests that Zizek's critique may have some validity, and offers the potential for a "critical integral theory" as an alternative. Situated in Deleuze and Guattari's concept of becoming, and represented in the ideas and practices of a constellation of thinkers inclusive of Gurdjieff, Benjamin, and Trungpa, the article's view of integration supports radical democracy as presented in the writings of Laclau and Mouffe as a model outcome for social and personal transformational practices.

Keywords: ideology, integral, critical, becoming-other, transformational practice, Aurobindo, Deleuze, Guattari, Ziporyn, Tarthang, Trungpa, Benjamin, Gurdjieff, Laclau, Mouffe, Zizek

Introduction

In *On Belief*, Slavoj Zizek (2001) argues that

> the onslaught of the New Age 'Asiatic' thought, which, in its different guises, from the 'Western Buddhism' (today's counterpoint to Western Marxism, as opposed to the 'Asiatic' Marxism-Leninism) to different 'Taos,' is establishing itself as the hegemonic[1] ideology of global capitalism (p. 12).

---

[1] A detailed examination of hegemony as a critical concept is beyond the scope of this paper. Ernesto Laclau and Chantal Mouffe (2001), in *Hegemony and Socialist Strategy*, offer a genealogy of hegemony, a precise mapping of ideology and hegemony as socioeconomic functions, and a theoretically sound means for the cooperation if not synthesis of various social organs working against the flows and currents of Empire, inclusive of ecologically-oriented, gender or race-based, and labor groups—radical democracy. For these reason, Laclau and Mouffe merit a close examination by Integral theorists. In *Passages About Earth*, William Irwin Thompson (1973) explains there is "a unique contribution to the New Age that America, not India, could make, and that contribution [is] politics, the politics of Washington and Jefferson" (p. 178). While under the present state of American Empire, it is difficult to maintain this kind of optimism—will we be "greeted as liberators" by the New Age? In spirit, Thompson's sentiment is in keeping with Laclau and Mouffe's project in its application to a critical Integral theory.

SOME RIGHTS RESERVED

This critique is clearly intended at least in part for Integral theory—but on what grounds, and why? Specifically, how should Zizek's critique be read in the context of Integral theory?

As a hypothesis to be tested, in his suggestively titled essay "What is Enlightenment?" Michel Foucault gives a prescription for how to proceed with a test of such as a hypothesis as this. For Foucault, critique is not

> to be practiced in the search for formal structures with universal value, but rather as a historical investigation into the events that have led us to constitute ourselves and to recognize ourselves as subjects of what we are doing, thinking, saying. In that sense, this criticism is not transcendental, and its goal is not that of making a metaphysics possible: it is genealogical in design and archeological in method (1984, p. 46).

Taking Zizek's comments above as a hypothesis, the critical question is historical: how did this *search for formal structures with universal value*—typified by the concept of the "perennial philosophy"[2] characteristic of the work of many Integral thinkers—come to be the ideology *par excellance* of the dominant social order, if it is such? Foucault makes an observation here that will have elaborate consequences for this paper: critique that shows everyday realities to be contingent and potentially *nonsense* is potentially transgressive (p. 45) in its recontextualization, a surprise that transforms what comes before it in the way the punchline of a joke fulfills or redeems the set-up that comes before it.

This inquiry suggests that Integral theorists should take Zizek's critique to heart. First, I examine the genealogy of the imperative *to integrate*, demonstrating the implicit ideological investments of Integral theory's foundational theorist, Aurobindo Ghose.[3] Zizek's critique is shown to be a plausible interpretation of Integral theory's ideological pedigree and foundational logic. Second, I propose two criteria that a theory should meet for it to be considered authentically Integral and critical—that is, to be able not only to hold up to an ideological or cultural critique, but to also function *as* an ideological critique and a means of praxis. In short, a critical Integral theory finds ground for the transformations in subjectivity utopian critical theorists such as Gilles Deleuze and Felix Guattari map out and prescribe, which are none other than the outcome of transformational practices Integral theory prescribes, while embracing the surprises arising from an ongoing act of compassion—genuine critique.

---

[2] The concept of a "perennial philosophy" is a foundational assumption of much Integral thought; it informs Wilber's discussion of spirituality, for example, from *No Boundary* (1979) beyond *The Eye of the Spirit* (2001a). This concept gained some intellectual currency at the pitch of the Enlightenment with the work of Leibnitz, named by Ziporyn as a thinker still capable of maintaining his credibility as such while making ostentatious universalistic truth-claims about his work, and his claims about the man producing such work (that is, himself as one who is up to the task). The "perennial philosophy" as a concept, then, coincides historically with a moment of uncritical self-fashioning. The relatively early vintage also suggests that the logic of integration as "East-West synthesis" may have circulated among intellectuals long before Aurobindo—and not in the sense of forcing all antiquities into a scheme of Biblical teleology (an ideological "return to roots") as parodied in the paranoid figure of Casaubon. Thus, while it performs a significant function in Theosophy and synthetic Integral theory—functions of popular culture, not philosophy of theory strictly defined—it may also have had some kind of credibility in intellectual culture. Had they the resources, would early holist Edmund Spenser have produced an early Integralism?

[3] The influence of Aurobindo's idea of integration-as-synthesis cannot be overestimated in Integral studies or for cultural production generally, which is one reason why it seems Zizek is not overstating his case, and why his critique deserves a fair hearing. Beyond the direct reception of Aurobindo's writings by an undifferentiated readership and the specialized reading communities in the academy and the professional world, Aurobindo's synthetic gesture has lies behind the foundation of educational institutions such as CIIS, by Aurobindo's disciple Haridas Chaudhuri; and Esalen Institute, co-founded by Michael Murphy, who himself spent a significant period of time at Aurobindo's ashram and popularized Aurobindo's ideas, leading to what became known as the human potential movement and helping invigorate the profitable "Self Help" and "New Age" marketing niches in publishing. Integral theory, arguably a reification or clarification of Integral pedagogy, remains Aurobindian from tip to toe inclusive of thinkers as diverse as Wilber and Thompson. Outside the gestalt of Integral studies, D.P.

The Imperative to Integrate

Brook Ziporyn (2004) opens his book *Being and Ambiguity* with a parody of the project he has undertaken, evoking Foucault's dismissal of a *search for formal structures with universal value*:

> All other books are included in and superseded by this book, which finally reveals the absolute truth about the universe and its application to all possible facets of human experience. The crucial paradigm shift has been discovered which reduces to irrelevance all the bitter struggles of past and present philosophers and theorists in all fields; this discovery has been made by me and explicated in the work you are now holding […] integrated […] so that it is revealed that all were about each other, and resolved into a far richer set of possibilities and vistas of new experience than you had dared hope for (p. xiii).

Ziporyn's riff reads like a send-up of claims not infrequently made in Integral theory. Compare it to a representative selection from a prominent Integral theorist: "Out of this bewildering diversity of views, I have attempted a synthesis, an overall perspective […] To my knowledge, no other book offers this type of overview."[4] In case the reader had any doubt of his parodic

---

Chattopodhyaya, arguably the most prominent professional philosopher living in India, has spent much of his career explicating Aurobindo's social thought. Unfortuantely, much of his work is not easily accessible to non-specialists outside South Asia. To adapt a meme attributed to Whitehead: if European philosophy amounts to a footnoting of Plato, Integral theory may very well amount to a conversation about Aurobindo. This bit of context foregrounds Aurobindo's achievement: while philosophers such as Schopenhauer and Nietzsche responded to Asian ideas in European terms, the notion of an "East-West *synthesis*" traces its genealogy to Aurobindo Ghose. Blavatsky, who crystallized this meme and circulated it heartily among the bourgeois of *fin de siecle* Europe in the form of Theosophy, can be credited with (or held responsible for) inventing the cultural phenomenon of "East-West synthesis." This is why a response to Zizek's critique of Integral *theory* (as distinguished from Integral *culture* per se) must begin with Aurobindo, and a cultural analysis should begin with Blavatsky. Approaching Aurobindo's position in the Integral canon from another way, in his Forward to *A Greater Psychology*, Wilber (2001b) credits Aurobindo with synthesizing the Hegelian view of evolution as Spirit-in-action with "ancient wisdom" (p. vi)—a fair judgment—and for this reason, suggests that "[a]ll subsequent attempts at such integrative efforts must […] at least acknowledge Aurobindo's enduring genius and in many ways still unsurpassed efforts" (p. vii).

[4] This is from the second (unnumbered) page of the Preface to Ken Wilber's early popularization, *No Boundary* (1979). Wilber's (2000b) popularization *A Theory of Everything: An Integral Vision for Business, Politics, Science, and Spirituality* is clearly *not* intended for a readership sensitive to the

intention, Ziporyn offers the reassurance that “such claims are nowadays immediately taken as irrefutable signs of crankdom, found only in fanatical and naïve street-corner tracts or deliberately obscurantist New Age self-help manuals” (p. xiii)—and, implicitly, the monolithic Big Books that have provided inspiration for Integral theorists, such as Helena Blavatsky’s *The Secret Doctrine,*[5] Aurobindo’s *The Life Divine*, Alfred Korzybski’s *Science and Sanity,*[6] and, arguably, certain of Wilber’s longer studies.[7]

Ziporyn then makes an unexpected move that transforms what he has written so far: he suggests in the pages immediately following this set-up that *his book may very well present the answer to all questions in a systematic manner*, the seemingly Quixotic “key to all mythologies” satirized in the figure of Casaubon in George Eliot’s 1871 novel *Middlemarch* (the late Victorian vintage of this example as well as its author’s interventions in German idealistic thought are suggestive of the themes that are to follow). By affirming the “punchline” to his own set-up, Ziporyn becomes an authentic Integral thinker,[8] just as writers such as Aurobindo and Ken Wilber, and institutions such as the California Institute of Integral Studies, are dedicated to the project CIIS president Joseph Subbiondo calls making “meaningful wholes.”[9] The first definition listed in the *Oxford English Dictionary* for “integral” cites precisely this holism, while the second designates the method by which wholes are manufactured—synthesizing component parts in order to produce a constitutive unity (note the use of the word “synthesis” in the Integral quotation above). The method of integration-as-synthesis, promoted by Aurobindo and used by many Integral theorists such as Wilber, is a point at which Zizek’s ideological critique strikes home.

If Ziporyn supports holistic thinking and Integral means, why does he parody this tendency toward the synthetic and the systematic in the first place—put another way, why does our current intellectual culture generally tend to be suspicious of Big Syntheses such as those proposed in

---

“inevitable signs of crankdom” (per Ziporyn) that the title itself evokes. As a cultural phenomenon, however, Wilber’s title clearly owes a generic or formal debt to Blavatsky’s *The Secret Doctrine: The Synthesis of Science, Religion, and Philosophy*.

[5] Volume II of this text is more preoccupied with a mythology of race than anything in Aurobindo’s oeuvre, to anticipate the rhetorical trajectory of this paper. The same could be said for Tolkien’s fantasy worlds, prepared in the decades following, which is suggestive of the cultural tenacity and pervasiveness of racial typography.

[6] A productive line of inquiry apropos of Korzybski and the project at hand will be to “open up” the “anti-Aristotelianism” of General Semantics by recourse to the directly anti-Aristotelian performance theory of Augusto Boal (1985). Where Korzybski finds the potential for coercion in the dualistic thought patterns he calls Aristotelian (criticized as a straw man argument, but more likely simply a category of convenience), Boal identifies ways in which Aristotle’s model of tragic production is in fact coercive.

[7] That this parody speaks directly to the frustratingly ambivalent position of Integral theory *vis a vis* the academy which, in my opinion, makes it all the more relevant to the conditions of working in this still-emerging discipline.

[8] Ziporyn’s method, while Integral, is not synthetic in the way Aurobindo’s is, and therefore has real potential for the development of a critical Integral theory.

[9] The full text of Subbiondo’s comments regarding the purpose and direction of the Institute from which this quotation is taken is available at http://www.ciis.edu/catalog/presidentsmessage.html. Wilber (2001a) defines Integral practice in similar terms in *The Eye of the Spirit*: “one of the aims of an integral approach (and what we call integral studies in general) is to honor and incorporate each of these extraordinary domains—intentional, behavioral, cultural, and social” (p. 11), corresponding to the four quadrants of his own “key to all mythologies,” itself intended to be a meaningful whole.

the Integral Studies gestalt? One answer explored at length in this paper is that Ziporyn is an Integral thinker but not a synthetic one; a second, more immediately relevant answer is suggested in Ziporyn's self-parody, in the figure of the nineteenth-century idealist, or rather ideologist. "For ethical as well as intellectual reasons," Ziporyn writes, "this kind of self-mythologization, still possible, say, for Spinoza and Leibnitz, and also, more complicatedly but nonetheless unmistakably, for Hegel or Schopenhauer, has been thoroughly discredited, and appears ludicrous to us now" (p. xiii). What has ideology to do with the self-fashioning of intellectuals?[10]

Everything. *Ideology is that which fashions selves,*[11] directly or indirectly, and theorists are not excepted—particularly not when they attempt truth claims on the "perennial philosophy." In *Tarrying with the Negative*, Zizek (1993) gives the example of a nation finding its roots—a phenomenon explored below in the example of Matthew Arnold—as a manifestation of ideology in a moment of political crisis, "*the (national) thing returns to itself*" (p. 148). This return to imaginary roots is actually an alienation from present realities that serves a political (ideological) end. According to Zizek, one aspect of an ideological critique is to "designate the elements within an existing social order which—in the guise of 'fiction,' i.e., of the utopian narratives of possible but failed alternative histories—point toward the system's antagonistic character and thus 'estrange' us from the self-evidence of its established identity" (p. 231). An expedient example: the self-evident identity of the United States is a history of legal or de facto slavery, and of aggressive landgrabbing at the expense of the marginalized—the alternative history suggests that the U.S. has always stood for freedom in the abstract, and that all have always been free to participate in a system of private property and free enterprise. In short, *ideology is a return to imaginary roots, a fantasy mistaken for a perennially-valid reality*.

What motivates the Emperor[12] to lie[13] about his new suit—in fact to insist that this new one is his *traditional* costume, the one he's always worn? The Nietzschean answer is the most plausible, the will-to-power, or will-to-stay-in-power. Wilber might call this phenomenon a "pathological holon." The narrative elements Zizek speaks of, ideological memes, bear with them hierarchies or strata, at minimum the binary offered by most gestalt theories of perception: I see *this* because it is distinguished from *that*. While this and that need each other to exist as such, *this* is privileged as the object and *that* is merely stage dressing. One's ideological investments or will-to-power can be quantified by what-is-seen in this sense. *Theories claiming to answer all questions and enclose all matters ideologically push something or someone aside*—the typical examples being women, workers, the poor, racial minorities, animal life, or any other marginalized stratum.[14]

---

[10] Wilber labels this phenomenon of self-fashioning narcissistic, asserting in the perhaps hubristically titled *A Theory of Everything* that the prevalent "Culture of Narcissism is antithetical to an integral culture" (2000b, p. 4).

[11] The view of subjectivity as a product of ideological and hegemonic forces (per Althusser, much of Foucault) dominates this essay, but it does not preclude the idea that subjectivity is actually a precise kind of performance (per Judith Butler). An examination of this issue lies at the heart of a critical Integral theory, but flies outside the trajectory of this paper.

[12] Empire is to be understood here in the sense Hardt and Negri (2001) assign to it in *Empire*, a groundbreaking study that has useful resonances to William Irwin Thompson's concept of noetic polities.

[13] Zizek's reminder that ideology is not always false—that a statement can be objectively true and ideological at once—bears repeating in this context.

[14] In *A Brief History of Everything*, Wilber (2000a) writes, "When any holon in a natural holarchy"—itself a concept I have reason to be skeptical of—"usurps its position and attempts to dominate the whole,

Is it possible that the synthetic method of Integral theory has done this from the start?[15] A genealogy of integration-as-synthesis suggests that it *is* possible, and that this possibility demands critical attention. Aurobindo's adaptation of integration from nineteenth-century English criticism and the cultural impact of Theosophy is the foundational gesture of Integral theory.[16] This synthetic model of integration seeks unities and abstractions that are synthesized on post-Hegelian grounds and with proto-Hegelian assumptions,[17] which leads to hierarchies that

---

then you get a pathological or dominator hierarchy—a cancerous cell dominates the body, or a fascist dictator dominates the social system" (p. 25). By contrast, I suggest that all stratified systems are pathological hierarchies by their nature, and that critical Integral theory must aspire to a radical democratic process model, in which the socius (per Deleuze and Guattari, 1987) as a holon is vertically undifferentiated and horizontally specialized, yielding anarchism without anarchy, in a sense. In this way, a position that is anti-heirarchy and pro-holarchy is possible, provided that one is willing to part ways with the distinction between natural and pathological holarchies. Assuming any one given social order is natural or inevitable is, of course, an ideological gesture and is therefore pathological in Wilberian terms. Wilber asserts that "the cure for these pathological holarchies is not getting rid of holarchy per se—which isn't possible anyway—but rather in arresting the arrogant holon and integrating it back into the natural holarchy" (p. 25). The ideological use to which this concept can be put by a "pathological" holarchy, such as the current regime, are legion. The "proper place" Wilber speaks of as the site into which the arrogant holon is to be integrated may very well be Camp X-Ray at Guantanamo, if the "cancer" persists in prescribing its own therapy. The critical question: How does a given holarchy police itself, and police the policing?

[15] Wilber observes that "where we locate Spirit always translates into political agendas" (*The Eye of the Spirit*, 2001a, p. xxii), specifically the agendas of those doing the locating. Where does Integral theory locate Spirit? In "timeless, ever-present awareness, which is said" (by Wilber in this case) "to be nothing less than the actual location of Spirit itself'" (p. 253). Is it possible that speculations such as this on nonduality and subjectivity, regardless of their truth value, can function ideologically?

[16] As a historical matter, Aurobindo's early political practice differed sharply from the ideological investments he exhibits in the criticism and religious writing he produced later in life. The man was a revolutionary. For many years, he wrote extensively against Imperial rule, and was imprisoned for his actions. This was hardly a synthetic conciliation of East and West—this was guerilla war, and another subtext for why a critical Integral theory can begin with Aurobindo. Peter Heeh's (2003) *Sri Aurobindo: A Brief Biography* gives a detailed analysis of this early period of Aurobindo's life, as well as a survey of his role in the political life of modern India. Aurobindo can be presented as a terrorist by right-leaning critics, or a freedom-fighter by those on the left; praised as a Blakean prophet-against-Empire or dismissed as a water-boy for Victoria's footmen. The latter view is perhaps a caricature of the critique presented here because it is from that pattern of Aurobindo's gestures that the synthetic-Integral method arose. Whether Aurobindo became more conservative as he aged, or as he deepened his yoga practice, or if his politics began ambivalently and remained so to the end, are still open questions. Heehs suggests that Aurobindo's political interventions were after 1908 in fact the practice of karma yoga, as was his retirement from politics. Regardless, Heehs reports that "Sri Aurobindo's life after 1920 had little outward incident. A narrator of documented events is left with almost none to relate" (p. 130).

[17] "Hegelian" here does not necessarily reflect the work produced by G.F.W. Hegel in Prussia in the nineteenth century, but does designate the dialectical, idealistic, and conservative thinking implied by his name. In practice, Hegel was clearly a more ambitious, ambivalent, and incomplete thinker than the meme "Hegelian" might allow him to be. In short "Hegelian" should be read culturally and not strictly speaking critically here. Similarly, this position does not reject Michael Basseches's view that dialectical thinking may represent "adult intellectual *development*" (2005, p. 48). While I do not accept the dialectic generally as a means of achieving final and conclusive truths, I do recognize the value of dialectical

prove to be ideological in nature in the scheme of human history Aurobindo[18] presents, in which all of animated Nature is evolving in the sense of making *divinely-sanctioned progress*, suggesting that the status quo is also divinely sanctioned, as is any future order—a position any Empire, that of Victoria or of global capitalism, will find congenial.[19]

Aurobindo's literary criticism is historical in nature; as Peter Heehs (2003) observes, Aurobindo's *The Future Poetry* is effectively an elaboration of Matthew Arnold's 1880 *Study of Poetry* (p. 122). From Arnold and the generation of critics that followed him, the notion of synthesis as an evolutionary process comes into Aurobindo's thinking, and with it the Victorian ideology of race, of "bloods." The details of this ideology yield much insight into the history of the *how* and *why* of integral theory—the means and ends of Meaningful Wholes. Specifically, integration-as-synthesis can be regarded as a product of *fin de siecle* culture,[20] including a specific debt to its race theory and other ideological impulses, and also as a response to said culture.

The Future Poetry is at once a primer on the history of English literature for an Anglophone Indian readership, and a prescription for a spiritualized aesthesis, positing the possibility of a future spiritual and aesthetic renaissance legitimized by an idealistic and ideological reading of this history. The speculations on English poetry included in this volume arose from a matrix of influences Aurobindo could not have avoided in his private tutorship in England or at King's College, Cambridge. Among the most significant of these must have been the literary criticism of Matthew Arnold, England's poet laureate and dominant man-of-letters during much of Aurobindo's formative stay. In Arnold, the reader sees writ large the "return to roots" Zizek identifies as a symptom of ideology at work.

---

thinking as a means of learning, specifically learning how to read carefully and think clearly (as Basseches suggests).

[18] The thrust of this genealogy seems to contradict Wilber's view that "Aurobindo was ridiculing and condemning those who think" in a racist fashion ("Forward," 2001b, p. ix), but the question of whether Aurobindo definitively was or was not a racist *personally* is in the main irrelevant to my point. The question at hand addresses Aurobindo's ideological alignment, which is concomitant in this instance with a racist agenda, which can readily be seen outside *The Human Cycle*, the text Wilber cites as anti-racist. Is Aurobindian Integralism ideologically productive of repression? This analysis suggests it may be.

[19] This critique is *not* intended to discourage anyone from taking up the Integral Yoga of Sri Aurobindo as a transformative practice, if one pleases to do so—on the contrary. The workings of Shakti as Sri Aurobindo described them are hardly systematic, synthetic, or oppressive, and the task of the Integral yogin is to open up to this force for the sake of all beings without exception, or in Sri Aurobindo's words "not for the sake of the individual but with an eye to the universal evolutionary process" (*Synthesis*, p. 339). To reject synthesis in favor of surprises is one imperative of this paper; it is also the significance of Aurobindo the poet's writing practice. My use of the name Aurobindo in the main text of this paper, sans *Sri*, is intended to underscore the distinction between Aurobindo the critic, poet, and thinker from Sri Aurobindo the guru and spiritual technologist, a distinction not easily maintained given that Aurobindo's poetry is shot through with Sri's spiritual vision, like teasing Milton-the-Puritan and Milton-the-Poet apart.

[20] English popular culture was rife with anxiety about heredity, demonstrable change over time, and social order, as evidenced by the social impact of Darwinian theory. Arnold's thinking clearly arose in the same cultural matrix that produced Sir Francis Galton's proto-Eugenics, where one's personal characteristics are determined by one's heredity. The pop-science of the period featured phrenology prominently, by which one's personality traits (even spiritual state) could be "read" from one's physical features, which are also determined by heredity.

In “On the Study of Celtic Literature,” Arnold (1962) interprets Humboldtian historical linguistics—demonstrable change over time—reductively, conflating races with language groups, in order to discuss “the pregnant and striking ideas of the ethnologists about the true natural grouping of the human race” (p. 301). “Natural” in this case already anticipates certain characteristic Integral gestures, specifically the assumption that the findings of one field of inquiry will be relevant to another. As languages and species evolve, so do cultures and races by this logic. For Arnold, Arya (denoting an ancient ethnicity) and Indo-European (an ancient language) are interchangeable terms. Arnold sketches out a taxonomy of English literature’s racial heritage qualitatively, taking arbitrarily assigned abstractions with no quantifiable basis as a means of putatively scientific classification. According to Arnold, the

> English spirit, the English genius [can be] characterized […] by *energy with honesty*. Take away some of the energy which comes to us, as I believe, in part from Celtic and Roman sources; instead of energy, say rather *steadiness*; and you have the Germanic genius: *steadiness with honesty* (1962, p. 341).

By contrast,

> [t]he Celtic genius [has] sentiment as its main basis, with love of beauty, charm, and spirituality for its excellence, ineffectualness and self-will for its defect. The Norman genius, talent for affairs as its main basis, with strenuousness and clear rapidity for its excellence, hardness and insolence for its defect (p. 351).[21]

These arise in a composite, according to Arnold, in the English—a lamentable composite. “Our want of sureness of taste, our eccentricity, come in great measure, no doubt, from our not being all of a piece, from our having no fixed, fatal, spiritual center of gravity” (pp. 381-382). And for Arnold, this is not a problem that can ever be addressed through applied inquiry or transformational practice,[22] because this is a linguistic and therefore racial defect of the English, per his Humboldtian speculations.

Aurobindo accepts this racist theory of cultural history that, with one significant exception, matches Arnold’s precisely. In both the exception and the rule, Aurobindo is a product of his ideological environment—an interpretation no more surprising than Aurobindo’s demonstrated incorporation of Victorian translations of Plato in his masterpiece, *Savitri*. The critical culture that embraced the “white man’s burden” of Rudyard Kipling produced the systematically Hegelian idealisms of A.C. Bradley’s 1909 *Oxford Lectures on Poetry*, in which tragic conflict is taken to be a dialectical movement leading to Universal Justice, in which all things without exception have a place, synthesized in a meaningful totality—a presumptive and belligerent culture, willing to speculate authoritatively on the Nature of Reality, Cosmic Morality, and the self-justification of Empire. It is the critical culture that Bradley promoted which gave Aurobindo the most rigorous intellectual training of his life, leaving him with the skill that would make his career as a nationalist and a guru: his ability to write. Along with the Theosophical memes of occult unity of religions then circulating in Europe, Bradleyan criticism offered Aurobindo a reasonable solution to the assumed problem of disunity and disharmony in the English blood-soul: synthesize it, universalize it—in the proto-Darwinian language of the day, it must evolve and progress. Integral theory is born at this moment as a way to resolve the ideological insecurities of the English Empire.

---

[21] One may speculate on the similarity of characteristics assigned to the Irish here, and those projected onto “the mystical East” chronotopically—and Cousins’s (1919) comments on Aurobindo’s functional Irishness.

[22] The archetypal lament of Integral theorists—that modern consciousness is fragmented, and a spiritual center of gravity is needed—is of a piece rhetorically with Arnold’s critique of the English ethnic pedigree.

"This peculiar distribution of national capacities finds its root in certain racial characteristics," Aurobindo writes in *The Future Poetry* (p. 47). "We have first the dominant Anglo-Saxon strain quickened, lightened, and given force, power, and initiative by the Scandinavian and Celtic elements. This mixture has made the national mind remarkably dynamic and practical" (p. 47). Arnold had attributed this assumed English practicality to the Normal racial type. This is the only significant way in which Aurobindo differs from Arnold—significant in that it allows Aurobindo a properly dialectical movement, and therefore a means of integration. His position on the Teutonic blood he takes as his thesis; his antithesis is the Celtic stock, "the submerged, half-insistent Celtic, gifted with precisely the opposite qualities"—opposite, as befits a proper antithesis—"inherent spirituality, the gift of the word, the rapid and brilliant imagination […] left to it from an old forgotten culture in its blood which contained an ancient mystical tradition" (p. 48). Of these antitheses, a synthesis arises that directly evokes Arnold's distress over the presumably motley English race: "vehement but embarrassed power, like an imprisoned spirit let out for a holiday" (p. 48).

Further, Aurobindo's dialectical working-out of Spirit through forms, in this case the forms of races, is of a piece with the neo-Hegelianism of Bradley's positions on tragedy, by which characters on stage are figures in the movements of an inevitable, all-consuming, and absolute Universal Justice from which there is no escape. These idealized gestures need not concern themselves with ethnographic reality. As abstractions in a working ideological system, they are formulated to wind around a much more significant and politically viable Ultimate Reality, the most radical "return to roots" possible—and they remain functionally static throughout much of the corpus of Aurobindo's voluminous writings. For example, Aurobindo identifies the spiritual inertia inherent in the Celtic "strain" with the modern Irish. In "Lines on Ireland" (1908), the poet laments the weakness of Irish polity but asserts, "her weak estate/Could not conceal the goddess in her gait" (pp. 7-8)—which functions as "a power within/Directed, like effective spirit unseen/Behind the mask forms, a source/And fund of tranquil and collected force" (pp. 40-42). And in Canto Four of the heroic poem "Urvasie," the poet attributes the "Vedic litanies" to the ancient "Aryan race," a gesture Arnold would have approved.[23]

Aurobindo's inspiration for writing *The Future Poetry* gives some insight into how this return-to-roots functioned *vis a vis* Aurobindo's self-fashioning as a poet and critic. J.H. Cousins's 1918 study *New Ways in English Poetry*, published in India, is a short and idiosyncratic guide to contemporary poetry in English for an Indian readership. In a sense, the Theosophist Cousins sought to celebrate the potential for a kind of "East-West" spiritual synthesis through poetic inspiration in this text. Aurobindo, deeply impressed by it, writes, "the book on every page attracts and satisfies by its living force of style, its almost perfect measure, its delicacy of touch, its fineness and depth of observation and insight, its just sympathy and appreciation" (p. 1). Aurobindo typically reserves this vintage of hyperbole for poets such as John Milton and Percy Bysshe Shelley—poets he believed to be divinely inspired.

---

[23] This should not be taken as a sign that Aurobindo sympathized with the rhetoric or practice of the Third Reich, but it is fair to state the obvious, that the double meaning of Arya as "noble" and as a designation for a particular racial group has historically been of great use to the Fascist cause, and that the meme had been in circulation in Europe for a hundred years before 1933.

Cousins (1919) opens his book with a consideration of time and his own moment, opining that the first World War "has produced no poetry," at least none of the sort that bears "any epoch-making prophetic impulse" (p. 2). Even so, "it is not quite true that the war marks, if it does not create, a passing over from one phase of poetical activity to another"—that is, Cousins sees "a new spirit and method animating the poets of England" (p. 3). Cousins is not concerned with, or apparently aware of, the disillusionment with ideology and idealism prevalent in poets who experienced the war, such as Siegfried Sassoon—although he does find opportunity to praise Rupert Brooke, now notorious for treating his very brief war experience with naive sentimentality and rote nationalism. Cousins is not without hope, however; he sees the makings of an Aquarian age of revelatory abstraction in the first attempts of certain poets of the war era: "The minor poet reproduces his or her time; the major poet reveals through himself and his time the true spiritual nature and destiny of the universe. And this is just what these poets have not yet ventured to do" (p. 9). Cousins is working from the same assumptions Aurobindo learned from critics such as Bradley—opening functional common ground between Bradleyan idealism and Theosophical millenarianism—but with sentiments favoring Romantic zeal; for Cousins, the poet is a prophet, an unacknowledged legislator—"The protean creative energy is forever advancing the borders of 'reality.' The great poets anticipate the advance" (p. 15). Cousins seeks to anticipate this anticipation, a task presumably the work of a very great poet, declaring that "the new ways in English literature are breaking through the obstructions of ignorance, and all that hangs thereon, into the broad highway of literary evolution" (p. 15). Cousins takes prophecy as his purpose—he seeks to explain to the groundlings how the Spirit of the Language *moves*. This is pedagogy. Cousins hopes to give

> some temporary indication, however inadequate, of the direction of English literature at the present time and in the immediate past. This necessity has arisen out of a special movement to make education in India both national and rational [—Bradley's imperatives—] by putting it in contact with the vital spirit of literature, instead of starving it on half a dozen stale fragments of the literature of the past that have no interest for Indian youth, and that make the cultivation of good modern English speech impossible (1919, p. xii).

Cousins summarizes the imperatives of popular Theosophy here: the "West" is prepared with technical means, and precise and modern language, while the "East" offers *timeless* or perennial spiritual inspiration.

Cousins's brief chapter on Aurobindo provides some clues into which poet he feels could be up to the task of revealing the ways of God in this new age of poetry he envisions:

> The poetry of Aurobindo Ghose is a meeting-place of Asiatic universalism and European classicalism. It is inspired by the philosophy of the Vedas; but it is shaped and atmosphered like Greece, or the Greece that is dimly incarnate in English poetry (p. 27).

Here is integralism in its form as "East-West" synthesis—Esalen Institute in embryo. Further, according to Cousins, Aurobindo's "eyes perpetually go behind the thing visible to the thing essential, so that symbol and significance are always in a state of interfusion" (p. 28). This is the dialectical working of "perennial philosophy" and inspired language synthesized into one gesture—a synthetic integralism that is a *cosmic* "return to roots." Finally, Cousins relies on the same racial typing Arnold and Aurobindo do, while making it quite personal:

> For a companion to Mr. Ghose's double-sightedness, the simultaneous glimpsing of norm and form, we have to pass beyond the confines of Europe, and listen to the spiritual songs of AE. The Irish poet has not the patience and expansiveness of his Aryan brother, but in heart and vision they are kindred (p. 29).

Cousins identifies Aurobindo Ghose, essentially, as a Celt, in that he bears "the idealistic strain that is one of the most characteristic features of the Irish race" (p. 32)—an assumption that is not illogical, given the preoccupations of both men on "Irishness." Cousins identifies Aurobindo as a first-order teacher and prophet of the modern world on the basis of this theory of racial typing, *a poet capable of revealing, justifying, the reality of the universe to all beings*. On these grounds, Cousins gives Aurobindo credibility in the "East" and "West," synthesized into one *spiritual center of gravity*, to recall Arnold's lament. Aurobindo accepts the views of Cousins that offer him this position of authority. According to Aurobindo, Cousins raises the "possibility" of

> the discovery of a closer approximation to what we might call the *mantra* in poetry, that rhythmic speech which, as the Veda puts it, rises at once from the heart of the seer and from the distant home of the Truth (p. 8).

Aurobindo would spend the rest of his writing career fashioning himself as that seer, and producing some first-rate verse in the process.[24]

The birth of Integral from the spirit of synthesis, to summarize, can be understood in three stages. In the first synthesis, Aurobindo resolves the fragmentation Arnold found in the English soul by means of Bradleyan idealism. The imperative: integrate yourself by recourse to what is highest (read: most abstract) in yourself. Blavatsky had accomplished and popularized the second synthesis: that of the unitary spiritual vision of the "East" and the fragmentary materialism of the "West," including good modern English. The "perennial philosophy" promoted in Theosophy becomes a useful conceptual tool in the third synthesis, which Aurobindo accomplishes in accepting Cousins's criticism (effectively synthesizing the first two syntheses): the Integration of self as an evolution bearing an analogous relationship to that of the cosmos, both as expressions of some supreme being (proto-holism beyond that of Plato's *Timaeus* or *The Faerie Queene* of Edmund Spenser). This is a cosmic subjectivity, and a global "return to roots," to what absolutely underlies the subjectivity of every person and to the putatively universal, always-has-been significance of all religions. *This is the most radical*[25] *ideology imaginable*—no surprise it has popular appeal under Empire.

To illustrate the direct functions of this ideology by example: the nineteenth-century racial theory that Aurobindo uses to speculate on the future development of English literature—and, through Cousins, his place in it—is, as one might predict, integrated into his yogic program as well, and in starker terms. In *The Synthesis of Yoga*, Aurobindo (1971) explains that one

---

[24] The conventional Byronic Orientalism of Aurobindo's early fragment, "Khaled of the Sea: An Arabic Romance," suggests that at one point in his life, Aurobindo either uncritically accepted the assumptions about "the mystical East" he absorbed in England, or was at least willing to reproduce them.

[25] Radical, of course, is to be taken exclusively in its etymological sense here.

> may come to the conclusion that mental life, far from being a recent appearance in man, is the swift repetition in him of a previous achievement from which the Energy in the race had undergone one of her deplorable recoils (p. 9).

The spirit behind the culture, like Bradley's Universal Justice, is really *the* Absolute Spirit; this is Cousins's thesis and Aurobindo's. Because the significance of cultural production is synthesized with cosmic significance, the stakes extend beyond the racial heritage of *Hamlet* and *Paradise Lost* toward a global ideological crisis (recalling Zizek), appropriate to the conditions of the British Empire:

> For if the actuality of intellectual achievement is unevenly distributed, the capacity is spread everywhere. It has been seen that in individual cases even the racial type considered by us the lowest, the negro fresh from the perennial barbarism of Central Africa, is capable, without admixture of blood […], of the intellectual culture, if not yet of the intellectual accomplishments of the dominant European (pp. 9-10).

For Aurobindo, *the subaltern may be able to read*—a prospect aided, perhaps, by two authoritative primers on what to read, and how, one each by Cousins and Ghose—*but the subaltern may not write*. Not yet.

This is the kind of bald racism that justifies Empires—abstractions, eternals, and ideals that are mistaken for in-the-moment realities—"mistaken" for a reason. Aurobindo's sole criticism of Cousins's primer echoes the lament of the colonial agent or the outsourced management team: "a finger-post by the way is not enough for the Indian reader, you will have to carry him some miles on the road if you would have him follow it" (*Future Poetry*, p. 2). In fairness, Aurobindo discusses in the next paragraph of the *Synthesis* the possibility for "the advance of backward races" as a general function of spiritual evolution, which again arises as a species of Victorian optimism about technological Progress, inclusive of "the multiplication of labour-saving appliances" (p. 10)—a view that comes under scrutiny in the criteria for a critical Integral theory below. A global, totalizing ideology developed under the global, totalizing conditions of British colonial rule, today, circulates as the meme *par excellance* of total subjective and objective reality in the popular writings of today's Integral theorists, among others.

The broad strokes of this tentative genealogy of *integral*, an *integration* and their concomitant ideological function, while not yet conclusive, are firm enough to suggest that some new directions should be explored in order to understand in an Integral way how subjectivity functions (or is made to function), without simply replicating the hegemonic ideology of Empire. I submit one such direction: the potential for a critical Integral theory.

Toward a Critical Integral Theory

If Integral theory's reliance on synthesis as an evolutionary, cosmic force is to be reconsidered, even revised out of a critical Integral theory[26]—what is available to do the work demanded of that vacated concept? The *OED* gives a subdefinition for "Integral" as *immaterial* (the first use of the word in this sense is recorded in 1651). When explicated, *immaterial* yields two criteria for a theory to be considered both critical and Integral. In place of synthesis, a (critical) Integral theory should aim for a precise kind of praxis, *becoming*, which arises from productive relationships and multiplicities—what Ziporyn calls *transformative recontextualizations*, which amount to surprises.[27] And in place of evolution and concomitant stratification, a critical (Integral) theory calls for revolution—itself nothing short of a miracle, as Zizek observes. The following pages are intended to sketch out how these criteria work in enough detail to open up further, forthcoming inquiry.

The first criterion is the most literal reading of the word "immaterial"—*not strictly or only material*, which also means not precisely "immaterial," since an *idea* of the immaterial is itself a matter, thought-stuff. By no means should Integral theory limit itself exclusively to material questions, bracketing away the transhistorical as inappropriate for inquiry; and by no means should a retreat into the archetypal alternative to strict materialism, the "specifically European disease" of Transcendence (Deleuze and Guattari, 1987, p. 18) into an idea of a Divine, Absolute, Universal Being replace it. Rather, I propose an inquiry into the *intermezzo* between the meat world of perception, of form (*Schein*) and spiritual reality (*Sein*)—a third space Nietzsche connoted with the neologism *untergehn*, which can be suggestively rendered as *to go under* or *to undergo.*[28] *This is a theory of becoming rather than Being, of time and space rather than Structure.* Given the prevailing world order, the business of an immaterial theory is the active, ongoing work of unplugging subjectivity from the complex of late capitalism's desiring-machines.

As the purpose of this criterion is to ensure the Integrality of a given theory, an explication of it will begin with Aurobindo. While he did not reject the more-than-Miltonic role Cousins assigned to him as a potential world-teacher, Aurobindo used his writing of *Savitri* primarily as a means of transformation, of becoming, for himself.[29] Deleuze and Guattari[30] give a precise mapping of this process, according to which a multiplicity or collective "brings a becoming-molecular that undermines the great molar powers of family, career, and conjugality" (p. 233)—the social forms held in place by the strange songs of ideology, such as the fictional "traditional" family or fictional "traditional" marriage, to give two live contemporary examples of instances of ideology as Zizek defines them. To generalize, becoming is transformative in nature, therefore potentially destructive, and potentially liberating.[31] The challenge Deleuze and Guattari describe is to become something other than a belligerent bullet-brained fantasy-enforcing *machine*. Deleuze and Guattari give a series of negations that help explicate what becoming is not. First, it is not a "correspondence of relations," nor a "resemblance, an imitation, or at the limit, an identification" (p. 237). "To become is not to progress or regress along a series. Above all, becoming does not occur in the imagination" (p. 238). In other words, this is a horizontal rather than a vertical, transcendental process, although its significance lies in its vertical (destratifying) potential. "Becoming produces nothing other than itself […] a becoming lacks a subject distinct from itself" (p. 238). Thinking of animal mimicry: the animal one becomes is not a real animal, but the process of becoming-animal has a reality to it. In Aurobindo's case, the question is not whether he did or did not in *reality* become the prophet of the divine Mother, but rather the point is that he experienced (recontextualized) himself as such, became it, by the mediation of his writing practice. In this sense, critical Integral theorists should become prophets against Empire.

---

[26] Specifically, neither the key-to-all-mythologies, God-is-on-our-side implications of "the perennial philosophy" as articulated in Aurobindian or post-Aurobindian theory, nor the valence of paranoia (or at minimum neurosis) implicit in the synthetic model of integration according to which *every detail* (all quadrants, all lines) must be accounted for, gridded, and hung on the proper peg of the spectrum of consciousness or its functional equivalent, will ever survive a vigorous ideological analysis.

[27] Ziporyn's punchline can be profitably juxtaposed against the "absurd laughter" Thompson identifies with "mysticism" in *Evil and World Order*. "Laughter then involves detachment, and detachment is a fundamental form of freedom" (p. 56). Thompson's assertions on tragedy, by contrast—"Individuation is the tragic error"—are best elaborated by Boal's (1985) rendering of Aristotelian tragic theory as a mechanism of subjectification, an ideological device.

[28] This amounts to a break with forms of Integral pedagogy that assume a hierarchic or "pyramidal" movement upward that proceeds in predictable stages that has a significant historical precedent in Nietzsche's break with Wagner: "The same human type that raved about Hegel, today raves about Wagner; n his school they even *write* Hegelian.—Above all, German youths understood him. The two words 'infinite' and 'meaning' were really sufficient: they induced a state of incomparable well-being in young men" (p. 634). Nietzsche's polemic points to the role critique must play in any pedagogy, especially an Integral one.

The positive definitions Deleuze and Guattari offer for becoming are equally evocative: "Becoming concerns alliance" rather than filiation (p. 238)—like symbiosis between heterogeneous species, or the relationship between a teacher and collection of students. "Becoming is involutionary, involution is creative" (p. 238), where involution is understood to be something other than evolution. "Becoming is a rhizome, not a classificatory or genealogical tree" (p. 239). These *koans* can be solved by looking at how becoming works, through the example of becoming-writer. According to Deleuze and Guattari, "becoming-animal always involves a pack […], a multiplicity" (p. 239)—in short, a culture. Aurobindo was without doubt among the more cultured Anglophone writers of a generation that included James Joyce and T.S. Eliot32—he *contained* a multiplicity—but more significantly, he had built a culture around himself, through correspondence and the ashram that grew around him in Pondicherry that made becoming possible for all connected with it. Becoming-animal, one of the more conspicuous versions of becoming Deleuze and Guattari present, has little to do with literal animals in this context, except by analogy; in one sense, it is a cipher for becoming-writer. Deleuze and Guattari's examples are strictly literary, inclusive of Kleist (Penthesilea's becoming-dog), Melville (Ahab's becoming-whale), Kafka (Gregor's becoming-insect). In Aurobindo's case, the transformation is not simply narrated in a text, but by his own account a lived experience verifiable by a knowledgeable reading of his writings, which makes his case qualitatively unique. For this reason, he is the picture of the writer-sorcerer in Deleuze-Guattarian diction: "[I]f the writer is a sorcerer, it is because writing is a becoming" (p. 240).

---

[29] Some regard reading the poem as a transformational practice as well.

[30] When fully elaborated, Deleuze and Guattari's theory of becoming has many advantages to a critical Integral project beyond those touched upon here. The dynamic they describe between the "sorcerer" and the multiplicity offers a precise tool for explicating guru-disciple and guru-group phenomena, and is also relevant to critical Integral pedagogy and the concerns of Integral leadership models such as Jonathan Reams' (2005) regarding "the level of development necessary to perceive and act from an integral place" (p. 128). Further, the Deleuze-Guattarian insistence that their work is a project, itself a process, is in itself a model for how a critical Integral theory (to use the counterintuitive language I have adopted here) can remain productively irrelevant, and can be a step toward a vertically destratified social holon, the socius—radical democracy.

[31] Erik Thornquist (2006, personal communication) has suggested that the Chaos Theory promises to offer some valuable critical tools for elaborating this theory of becoming in an Integral context.

[32] The reception history of Aurobindo's poems in the Commonwealth and in the United States should be a productive point of study for postcolonialists. How is it that this most English of writers, more English perhaps than the English, still has an ambivalent position in the canon of literature in English?

Becoming defined in this way gives space for the transformational practices valued by Integral theorists without the counterproductive ideological baggage integration-as-synthesis carries, and is therefore a valuable tool for a critical Integral theory. As Dorothea Olkowski (1999) observes, efforts to construct objective narrative models of reality—unified field theories—are doomed to failure as a condition of language, and this may very well be a blessing as well as a challenge. It means learning is possible, if not inevitable, and that the miserable contingencies much of the world endures under neoliberalism and patriarchy are not necessarily inevitable, ideal, or here to stay. It also means that the status quo is constantly inventing new "roots" to return to, making new material to manage the situation at hand. The moment-by-moment work of a critical Integral theory is to keep the edge of critique ahead of the limit of the machinery of Empire's manufacture of saccharine consolation and team spirit.

Becoming is a way to refrain from participating in the subjectivity-games of the status quo, and to pursue a critical agenda, the consideration that beats through the heart of the second criterion, which is a colloquial reading of the word "immaterial"—as *irrelevant*, specifically irrelevant to the imperatives of the regime at hand, and non-profitable or even *unprofitable* as a business venture.[33] This returns us to Zizek's critique of Integral praxis as the hegemonic ideology *par excellance* of neo-liberalism, according to which "the 'Western Buddhist' meditative stance is arguably the most efficient way, for us, to fully participate in the capitalist dynamic while retaining the appearance of mental sanity" (2001, p. 13). John Morrow (1975) anticipated this critique while working for Chogyam Trungpa Rinpoche in 1974, at the inaugural summer session of Naropa Institute: "Macbeth with mindfulness? Buddhist propaganda under the disguise of far-out space awareness techniques, so we can go back to our old reactionary selves, and really enjoy them this time with the new costumes?" (p. 41). Morrow concludes that while this outcome, precisely the one Zizek identifies as reactionary and performative, is precisely *not* what happened at Naropa. Trungpa devised means of keeping his *immaterially* Integral project critical: "There is a particular philosophy of Naropa which is not so much trying to bring" traditions or practices "together, like a spoon of sugar in your lemonade so that it becomes more drinkable, but the point is more like a firework […], there is a meeting point which takes place in a spark!" (p. 18). In short, Trungpa wants to blow the fuses of his students' mental machinery, not to help them appear sane at their office jobs. While it was Integral, this curriculum was not a *synthesis* of Hindu, Buddhist, and psychological skillful means as they were presented at Naropa; nothing was produced, no superstructure, only an immanence, a surprise. Zizek is thinking of Western Buddhist meditation practice as a very relevant and profitable kind of sugar in the sour lemonade of cubicle life; Trungpa, a foundational figure in the history of Western Buddhism, rejects this kind of supplement as another form of spiritual materialism.

---

[33] Returning to the "writerly" examples of becoming, in *Moby-Dick* Ahab's hunt for the Whale is a miserable business model—much of his produce is squandered, the slaughter consumed by the sharks that swarm the *Pequod*,—but his project is to "pierce the veil," not to bring intact whale blubber back to Nantucket by the strength of his rhetorical appeal to becoming. Gregor had been supporting his family in "The Metamorphosis" single-handedly until he becomes a dung beetle, leaving the others to fend for themselves and, in fact, metamorphose. Antony squanders a political life, a share in Empire, in order to pursue his masochistic practice with Cleopatra—to borrow a Shakespearean example favored by a true poet of becoming, Helene Cixous. Parenthetically, *The Newly Born Woman*, co-authored by Cixous and Catherine Clement (1986), is an extended meditation on the business of becoming as it relates to issues of gender and language, and features a poetic analysis of Kleist and Kafka as well—authors favored in Deleuze and Guattari's theses on becoming. The explicitly literary nature of these examples is intended to illustrate my point that working toward a critical Integral theory must be taken as an intrinsically valuable project, as a creative endeavor and an act of kindness, rather than a neologism-coining gimmick for selling books and tchotchkes, or filling seminars. There can be no Critical Integral Theory™; this is not a proprietary scheme. Neil Young's 1974 recording "For the Turnstiles" renders this critique in more soulful and more biting terms.

Following this, I suggest that practices functioning as a palliatives to make neo-liberalism taste better, be it a warm feeling of wholeness, a teleology, a totalization, or even in some contexts a therapy—may be of benefit to some in some contexts, but may not have a place in a critical Integral theory. To see how a critical theory might be productively irrelevant to the contingencies of Empire's imperatives, one can use Zizek's prescription for a "Leninist" intervention, a trauma-of-benefit. Consider two examples from Buddhist hagiography: Tilopa cured Naropa by throwing things at his head, and Marpa transformed Milarepa by making a slave of him.

This functions in the same way as Gurdjieff's (1999) stated purpose in the front matter of his novel, *Beelzebub's Tales to his Grandson*: "To destroy, mercilessly, without any compromise whatsoever, in the mentation and feelings of the reader, the beliefs and views, by centuries rooted in him, about everything existing in the world." *By centuries*—time is not necessarily offering an aquarian unfolding of spiritual development in the souls of men; in fact, Gurdjieff's view of history more closely corresponds to Walter Benjamin's than that of Aurobindo. Consider Benjamin's famous image of the "angel of history:"

> His face is turned toward the past. Where we perceive a chain of events, he sees one single catastrophe which keeps piling wreckage upon wreckage and hurls it in front of his feet. The angel would like to stay, awaken the dead, and make whole what has been smashed. But a storm is blowing from Paradise […] This storm irresistibly propels him into the future to which his back is turned, while the pile of debris before him grows skyward. This storm is what we call progress (1968, pp. 257-258).

Rather than imagining in what would be regarded as bad faith that history represents material progress, Gurdjieff recommends cutting away the mental and emotive accumulations of time's industry as they have stratified and territorialized one's subjectivity, and discarding them. He gives 1,238 pages of very difficult and very amusing prose read three times in a particular way[34] as a means of lightening the work of the angel of history, to speak metaphorically. The use of masochistic language—breaking, cutting, dying—in this context is deliberate. Deleuze and Guattari use masochism specifically as an example of a risky home remedy that achieves an end cognate to Gurdjieff's merciless destruction "without any compromise" of the manufactured subjectivity of the reader. They call this end the Body without Organs (BwO).[35] One can make a BwO of oneself intentionally, but the practices Deleuze and Guattari observe—masochism, addiction, anorexia—lead them to caution, "you can botch it" (p. 149). Multiple means for accomplishing the BwO safely and sanely exist within the gestalt of Integral Studies; the Giant Body Exercises that Tarthang Tulku (1977) presents in *Time, Space, and Knowledge* (TSK) is a particularly delightful example, given the resonance in language and methodology. One experiences oneself first as a stratified body, then sees the strata as the nature of space, which reveals their boundaries to be in a sense arbitrary, until finally one experiences oneself as a deterritorialized *body* of space, a BwO. *Surprise*—things are not what they seem, nor does the order of things need to remain as it is.

---

[34] Perhaps the most significant aspect of the three readings Gurdjieff recommends to readers of *Beelzebub's Tales* is the motivation to undertake the practice of reading each time through: the wish to be of benefit to others first. This attitude and concrete methods for attaining it, are available in Chagdud Tulku's practical guide, *Change of Heart* (2003). Critical intervention or revolution must be undertaken with this kind motivation.

Conclusion

While the surprise of critical intervention is a break and a local disintegration, it is neither a discontinuity nor a global disintegration. I promote Ziporyn's technique of transformative recontextualization as an *immaterial* alternative to evolution as presented in synthetic Integral theories—a practice that pursues "second-tier" thinking to its logical conclusion.[36] The doctrine of the *Lotus Sutra*, according to Ziporyn, "is not some specific teaching about what the real is"—as is Wilber's attempt in *Sex, Ecology, and Spirituality*[37] to map all knowables objectively, an ambitious and Aurobindian project—"but just the act of opening up and revealing, of bringing teachings together so they are revealed to be versions of one another, one may say of *teaching per se*, that is, the ultimate teaching" (p. 91). As in Trungpa's curriculum at Naropa, the teachings Ziporyn speaks of are assembled in such a way, newly contextualized, as to yield a particular affective result. "Provisional is to ultimate as setup is to punchline. Enlightenment is here equal to humorousness, delusion to seriousness" (p. 97). This is another way of describing the net result of the critical inquiry Foucault (1984) calls for: "an *undoing* of this chronic previous habitual focus or mental grip, or seeing its groundlessness, arbitrariness, in other words, that another set of equally obvious facts, if attended to, change the significance, meaning, *identity* of the token in question" (p. 99).

---

[35] A productive line of future inquiry will compare the functions of the BwO relative to transformational practice and concepts such as holons and holarchy as Integral theorists such as Wilber have developed from Arthur Koestler's initial mapping of them.

[36] One may speculate at this point that an upcoming generation of integral thinkers may need to read Aurobindo, for example, in a manner analogous to approaches to Spinoza taken by theorists such as Deleuze, Antonio Negri, and Etienne Balibar—which is to say a recontextualization of the immanent or "immaterial" impulses that saturate the best of Wilber's thought into the interface between subjectivity and the machinery of late capitalism. This is not to suggest that Deleuze, Negri, or Balibar have necessarily revealed the final word on Spinoza, but to illustrate Ziporyn's point that "just the same content, when 'opened up' […], suddenly reads differently without having changed in the least" (2004, p. 93).

[37] A comparative study of Wilber's use of the Buddhist doctrine of relative and absolute truths and Ziporyn's—beyond the scope of this paper—will open up in detail the distinction I am mapping out here in abstract.

To draw this multiplicity of threads together: the BwO is the "punchline" moment to the tedious, territorialized stream of subjective time *that made the punchline possible*. In a sense, this critical intervention is the *Aha!* of the boy as he recognizes that the Emperor, the Empire, really is naked; for this reason it is wholly *irrelevant* to the aims and imperatives of Empire. Significantly, Benjamin's (1968) view of history[38] can be understood as an *immaterially* Integral one, where the despair of the angel witnessing the accumulation of infected detritus we experience prosaically as a lifetime of trips to Wal-Mart is potentially liberated *at any moment* by "a Messianic cessation of happening, or put differently, a revolutionary chance in the fight for the oppressed past" (p. 263). Notice that Benjamin is able to think in terms inherited from Marxism and Lurianic Kabbalah without reducing either to a synthetic whole, or one to the other. This kind of recontextualization is an *immaterial* Integral relationship that is, in a sense, laughed into being as one *undergoes* the surprise. And with it, Deleuze and Guattari's insistence that becoming is *not* an evolution is no longer a potentially anti-Integral gesture, meaning that it is possible for a theory to be both functionally Integral and irrelevant in a critical sense.

To conclude, synthetic Integral theory may very well be what Zizek suggests it is—part of a complex of ideologies that amount to a justification and a means of maintaining and regulating the pathologies of Empire. It need not be this way, however. This theory can emphasize becoming and immanent critique, a microintegrality, rejecting the teleologies of synthesis and evolution and the assumption that anyone's theory can speak to a "perennial philosophy." This may be the best way to understand how transformations in subjectivity can make substantive changes in the socioeconomic machines that themselves make subjects, and how a sane social order can support that practice of transformation. In shorthand: do not posit a coming New Age, an Ultimate Reality, or a "key to all mythologies." Do find the means of making a new age happen, make it happen, and keep it happening.

Measuring an Approximate g in Animals and People

Michael Lamport Commons

Abstract: A science of comparative cognition ultimately needs a measurement theory, allowing the comparison of performance in different species of animals, including humans. Current theories are often based on human performance only, and may not easily apply to other species. It is proposed that such a theory include a number of indexes: an index of the stage of development based on the order of hierarchical complexity of the tasks the species can perform; an index of horizontal complexity; and measures of g (for general intelligence) and related indexes. This article is an early-stage proposal of ways to conceive of g in animals and people. It responds to Geary's argument that domain-general mechanisms are essential for evolutionary psychologists. Existing research is used to enumerate domains, such as problem solving behavior in pursuit of food, or behaviors in pursuit of mates and/or reproduction, and itemize identifiable human social domains. How to construct g, across domains and within domains, is described.

Keywords: comparative cognition, domains, evolutionary psychology, hierarchical complexity, g, intelligence, IQ, measurement theory

Introduction

This article introduces a cross-species, cross-domain measurement theory of cognitive performance. Its proposal responds to the current lack of such a theory for the science of comparative cognition, and to evolutionary psychologists' needs for domain-general mechanisms (Geary, 2004). Even though current theories have generally not included this broader scope of intelligence, some of the very first studies of intelligence did address the issue as to whether or not animals could think (Romanes, 1988). Supporting the continuity of animal and human faculties, Darwin (1871) wrote, in concluding the fourth chapter of *Descent of Man*,

> Nevertheless the difference in mind between man and the higher animals, great as it is, certainly is one of degree and not of kind. We have seen that the senses and intuitions, the various emotions and faculties, such as love, memory, attention, curiosity, imitation, reason, etc., of which man boasts, may be found in an incipient, or even sometimes in a well-developed condition, in the lower animals. They are also capable of some inherited improvement as we see in the domestic dog compared with the wolf or jackal. If it could be proved that certain high mental powers, such as the formation of general concepts, self-consciousness, etc., were absolutely peculiar to man, which seems extremely doubtful, it is not improbable that these qualities are merely the incidental results of other highly-advanced intellectual faculties; and these again mainly the result of the continued use of a perfect language. At what age does the new-born infant possess the power of abstraction, or become self-conscious and reflect on its own existence?

Over the last century, part of this inquiry has developed into the field of evolutionary psychology. The concern in this field is for the adaptiveness of a wide variety of behaviors in

SOME RIGHTS RESERVED

multiple domains. In trying to address this issue, there has been an ongoing debate between modularity of intelligence (Cosmides & Tooby, 1994) versus general intelligence, mostly fought in the realm of human intelligence. In cognitive science, the modularity of mind refers to the idea that the mind is composed of independent, closed, domain-specific processing modules. Sperber (2002) states that Modularity is not just of the mind but of any biological mechanism. It can be envisaged at five levels:

1. At a morphological or architectural level, what is investigated is the structure and function of specific modules, and, more generally, the extent to which, and the manner in which the organism and its sub-parts, in particular the mind/brain, are an articulation of autonomous mechanisms.
2. At the developmental level, modules are approached as phenotypic expressions of genes in an environment. Cognitive modules in particular are hypothesized to explain why and how children develop competencies in specific domains in ways that could not be predicted on the basis of environmental inputs and general learning mechanisms alone.
3. At the neurological level, modules are typically seen as dedicated brain devices that subserve domain-specific cognitive functions and that can be selectively activated, or impaired.
4. At the genetic level, what is at stake are the pleiotropic effects among genes such that relatively autonomous “gene nets” (Bonner 1988) get expressed as distinct phenotypic modules. Genetic modularity is more and more seen as crucial to explaining on the one hand phenotypic modularity and on the other the evolution of specific modules (Wagner 1995, 1996; Wagner & Altenberg, 1996).
5. At the evolutionary level, hypotheses are being developed about the causes of the evolution of specific modules, and of genetic modularity in general. Understanding the causes of the evolution of modules helps explain the known features of known modules and also search for yet to be discovered features and modules.

In humans, the simplest operational definition proposed is that intelligence is whatever intelligence tests measure. In animal intelligence, the modularity view has generally dominated because most animals show no large degree of general intelligence (Locurto, 2004).

I will suggest that there should be some measure of general intelligence (g) (Jensen, 1998; Kanazawa, 2004) for animals. I will also present an alternative process and corresponding indexes that may be used along with traditional measures in humans such as IQ (Intelligence Quotient). This suggests another approach to human intelligence that more closely parallels the assessment of animal intelligence.

This approach will respect modularity and suggest that breadth of intelligence is a better way to summarize the generality of intelligence than the factorial approach of g so popular in academic approaches to human intelligence. Breadth will offer continuity with other animals and incorporate what has become known as the multiple intelligences of Gardner (1983/1993) and of Sternberg (1985). Breadth, which much of this paper leads to defining, will be carefully defined below and distinguished from traditional views of g.

Background of General Intelligence versus Modularity Studies

The concept of intelligence was the brain child of Sir Francis Galton (1869/1892/1962). Intelligence testing has been an empirically driven enterprise, with item selection based on very limited understanding of the domains of human endeavor. Charles Spearman (1904) found that grades of children in different subjects were positively correlated. These correlations seemed to be influenced by a dominant factor, g for "general" intelligence. He developed a model to account for the variation in intelligence test scores consisting of two factors. The first was g, a general factor that governs performance on all cognitive tasks. The second was the factor specific to an individual mental task: the individual abilities that would make a person more skilled at one cognitive task than another. Spearman's theory was too narrow. It did not consider other aspects of intelligence, for example, those corresponding to broad abilities such as spatial visualization, memory and verbal ability usually found through factor analysis.

In 1903-1905, Alfred Binet and Thophile Simon (Binet, 1903; Binet & Simon, 1905) worked on creating a practical way of assessing which children would not benefit from regular instruction for the French Ministry of Education. This was the Binet battery of tests. They did not suggest that that battery measured precisely any single faculty. This was because the battery was aimed at evaluating the child’s general mental development with a heterogeneous group of tasks. Binet had noted that children who had difficulty in school were very often late in developing skills in other fields easily acquired by most students of the same age.[1] In 1917, Robert Yerkes, who was President of American Psychological Association then, developed the Army Alpha and Beta Tests to measure intelligence in a group format. The tests were given to all new recruits in the U.S. military in 1918 onward.

At that time, there was almost no notion of animal intelligence. An exception was E. L. Thorndike, who did a great deal of work in both areas, coming up with the basic laws of learning. Thorndike's (1898, 1911) early studies with animal behavior produced his Law of Effect. That law states that responses to a situation that are followed by satisfying events are strengthened and responses that are followed by unpleasant ones are weakened.

Thorndike and his students began measuring intelligence as early as 1903 (Thorndike, 1904). When the United States entered World War I, Thorndike developed methods for measuring a wide variety of abilities and achievements. During the 1920's, Thorndike (1920, 1927) developed an intelligence test consisting of completion, arithmetic, vocabulary, and directions: the CAVD. This instrument was intended to measure intellectual level on an absolute scale. The logic underlying the test predicted elements of test design that eventually became the foundation of modern intelligence tests.

Thorndike distinguished three broad classes of intellectual functioning. Standard intelligence tests measured only abstract intelligence. The second class was mechanical intelligence: how well one visualizes relationships among objects and understands how the physical world worked. The third class was social intelligence: the ability to function successfully in interpersonal situations.

---

[1] Bergin and Cizek (2001) suggest that Binet’s work on measuring intelligence may have influenced Jean Piaget, (he worked for a time in the Alfred Binet Institute in Paris (Gruber & Vonèche, 1977), who later studied with Binet's collaborator Theodore Simon in 1920. But Piaget was more interested in the ways in which errors were made than the scores, leading his inquiry in other directions.

Thorndike proposed that there were four general dimensions of abstract intelligence:

- Altitude: the complexity or difficulty of tasks one can perform (most important).
- Width: the variety of tasks of a give difficulty.
- Area: a function of width and altitude.
- Speed: the number of tasks one can complete in a given time.

Factor Analysis

Factor analysis, a term introduced by Thurstone (1931), is a statistical procedure used to measure relationships among many variables. It allows numerous intercorrelated variables to be reduced to fewer dimensions, called factors. Factor analytic techniques are used to (a) reduce the number of variables and (b) detect structure in the relationships between variables, that is, to classify variables.

Thurstone administered 56 measures (15 hours' worth of tests) to 240 college students to try and determine the basic factors of intelligence. Without computers, it took him six months to compute the results. Thurstone found 12 factors to intelligence but only seven of these were clear enough to name. The one that persists today is g, the first factor.

Not too much has changed since Thorndike's and Thurstone's work. The determination of g from factor analysis takes only seconds now, and that determination is in most statistics programs. The same factors are found over and over, the main one being g, with many secondary factors also occurring. One can now do a Rasch Analysis on items from various intelligence measures, checking to see if they fall on a single dimension. But the scoring of item difficulty is such that items from very different domains will usually fall on a single dimension of difficulty in Rasch, without indicating the domain differences. A Rasch Analysis shows the degree of difficulty (Dattilio, Commons, Adams, Gutheil, & Sadoff, in press). It is a model that produces an objective, additive scale that is independent of the particular items used and of the particular participants tested (Wright & Linacre, 2001). Through the use of probabilistic equations, this model converts raw ratings of items into scales that have equal intervals. The Rasch Model was originally developed for large-scale achievement testing. Its use has since exploded in a variety of disciplines and for a wide range of topics, and it can be used to analyze a large variety of human sciences data (Linacre, 2003).

A scale is produced, on which each item (which is coded for and entered as a raw data point) is placed according to its Rasch "rating," or scaled score. Such a scale can then be used as a type of objective ruler against which to measure the data on items as to difficulty as well as on respondents-ratings. The ruler-like properties of the scaled numbers or Rasch scores that are produced provide some advantages over other scaling techniques. For example, the scale is made up of equally spaced, continuous intervals, that is, it provides a linear, interval measure against which items can be compared. As a result, a change of difficulty of 1 carries the same weight from 0 to 1 as it does from 2 to 3 in the same way that, on a ruler, a change in length of 1 inch, either from 0 inches to 1 inch, or 2 to 3 is the same. Furthermore, doubling on the Rasch scale means the same change in difficulty anywhere along its linear axis. Again, using the figurative ruler example, doubling the distance from 1 to 2 results in an equivalent *magnitude* of change as doubling the distance from 2" to 4." In the case of difficulty, a value of 2.3 is half as severe as a difficulty of 4.6.

The accumulation of "cognitive" testing data and improvements in analytical techniques have preserved g's central role and led to the modern conception of g (Carroll 1993). A hierarchy of factors, with g at its apex and group factors at successively lower levels, is presently the most widely accepted model of cognitive ability. Other models have also been proposed, and significant controversy attends g and its alternatives.

Toward a More Expansive Measure of g

But there have always been problems with these models. Somehow the animal intelligences and the human intelligences have not been systematically connected. Also, there was no known way of determining, without giving people independent items to do, how difficult the items were on an absolute scale.

There is also the problem in comparative psychology with the lack of a good way to compare "how smart" different animals are, and this is also true for people. A science of comparative cognition ultimately needs a measurement theory of how to compare the performances of different species of animals and different groups of people. Current theories are often based on human performances and human norms and may not easily apply to other species. Furthermore, there is also controversy about whether such theories and tests apply to other cultures or if they do, can group comparisons be made. I propose that a theory of comparative cognition needs to include multiple indices. This application is derived from my application of measurement theory to the problem of how smart something is (Commons, Trudeau, Stein, Richards, & Krause, 1998). An index would consist of a numerical scale used to compare variables with one another or with some reference number. In this article, I propose a way to conceive of g in animals and people.

There is controversy within the field of evolutionary psychology as to whether or not g is domain specific or domain general. One of the perspectives on modularity come from evolutionary psychology, particularly from the work of Leda Cosmides and John Tooby (1994). This perspective suggests that modules are units of mental processing that evolved in response to selection pressures. With this view, much modern human psychological activity is rooted in adaptations that occurred earlier in human evolution, when natural selection was forming the modern human species. In contrast to modular mental structure, some theories posit domain-general processing, in which mental activity is distributed across the brain and cannot be decomposed, even abstractly, into independent units. A staunch defender of this view is William Uttal, who argues in *The New Phrenology* (2003) that there are serious philosophical, theoretical, and methodological problems with the entire enterprise of trying to localize cognitive processes in the brain. Part of this argument is that a successful taxonomy of mental processes has yet to be developed. Skottke (March, 2006) argues that general intelligence, g, can be described as the ability of an individual to acquire and apply knowledge. Many studies have shown that g is at least 50 percent heritable and thus, can be passed down from generation to generation (DiLalla, 2000).

Evidence is overwhelmingly against generality. Such evidence is usually expressed in terms of the concept of modularity (e.g., Bonner, 1988). Miller (2000) argues that one of evolutionary psychology's most distinctive ideas is the expectation that the control of human activity is massively modular. The brain evolved so that it is composed of hundreds of distinct psychological adaptations that evolved to solve distinct ancestral problems of survival and reproduction. Cosmides & Tooby go on to state that the rationale for massive modularity has been the supposed trade-off between generality and efficiency:

> As a rule, when two adaptive problems have solutions that are incompatible or simply different, a single general solution will be inferior to two specialized solutions. In such cases, a jack of all trades is necessarily master of none, because generality can be achieved only by sacrificing effectiveness (1994, p. 89).

Modularity is obvious for morphology: animals have distinct limbs, senses, and organs to do different things. Psychological and behavioral control modularity has been less obvious to psychologists, but evolutionary considerations of functional efficiency suggest the brain and behavioral control should be at least as modular as the body.

Geary (2004) has argued that domain-general mechanisms are essential for evolutionary psychologists. Geary proposes that human motivational, affective, behavioral, and cognitive systems have evolved to process social and ecological information (e.g., facial expressions) that covaried with survival or reproductive options during human evolution. Further, he argues that the ultimate focus of all of these systems is to support our attempts to gain access to and control of resources—more specifically, the social (e.g., mates), biological (e.g., food), and physical (e.g., territory) resources that supported successful survival and reproduction over time. In this view, Darwin's conceptualization of natural selection as a "struggle for existence" becomes, for us, a struggle with other human beings for control of the available resources. This struggle provides a means of integrating modular brain and cognitive systems such as language with those brain and cognitive systems that support general intelligence. To support his arguments, Geary draws upon an impressive array of recent findings in cognitive science and neuroscience, as well as primatology, anthropology, and sociology. In addition, Chiappe & MacDonald (2005) argue the need for such a notion to understand human evolution. Note, this paper will *not* address current issues on the psychometric view of intelligence and only review part of the historical context.

Charles Locurto (2004) has been studying the structure of early acquisition of behavior and of stimulus control. He has focused on the structure of individual differences in mouse “cognition.” There are specific mechanisms that are carried across at least some animals such as the structure of the eye and the nature of neural networks, but that does not equate to general intelligence. His findings with mice do not show a robust general factor (i.e., first principal component) that is typically found in human testing. Instead, he observed a more modular structure. The tasks he used in his batteries require a number of sessions to complete. Locurto cites a literature that says that clearer evidence of a general factor may be found if each task is run for only a few trials, thereby capturing early acquisition performance instead of performance following extended training. In response to this literature, Locurto developed a battery in which each task was designed to provide evidence of learning within a few trials. Moreover, each task was distinct in terms of motivation, sensory modality and/or behavior measured, thereby providing a strong test of the presence of a general factor. His results still did not indicate much of a general factor. This work led directly to what is presented here.

Modularity and Domains

Despite the theoretical debates, it is not an all or none proposition. Because values of g may have increased over evolutionary time as new organisms developed, there is a great need for defining g in a way that captures the issue of modularity versus generality in a systematic way.

Modules are similar to the notion of domains. These modules are thought to be related to brain function that is specialized for tasks in a given domain.

Although there are currently no standard ways to define domains, I take the strategy of relying upon existing research to enumerate domains. For example, many animals exhibit certain problem solving behaviors in pursuit of food, and different behaviors in pursuit of mates and/or reproduction. Animals also have different kinds of interaction behaviors with others of their own species. Some animals pair bond, some live in social groups, and some are loners, coming together only to mate.

Domains

In trying to measure g, or a general factor for animals, it would be good to have a list of domains and tasks within those domains that various animals can do. Domains are presently not on any scale. They are nominal. From the animal literature, the domains for most animals are discrete. The major ones I know are:

- Mate selection
- Attachment and caring
- Pecking order
- Prey defense
- Predator action
- Way finding
- Food sharing
- Migration
- Communication
- Social cohesion
- Recognition
- Food selection
- Choice in foraging

Hierarchical Complexity and Stage

The Model of Hierarchical Complexity (MHC) posits that tasks can be ordered as to their hierarchical complexity (Commons, Trudeau et al 1998). It belongs to the branch of mathematics called measurement theory. It formulates a measure of one major kind of task difficulty called *hierarchical complexity*. This measure is different from current measurement procedures in four major ways. First, hierarchical complexity of tasks forms an absolute scale rather than one based on norms, or content. Second, it is formulated in a manner similar to other measures from measurement theory (e.g., Krantz, Luce, Suppes, & Tversky, 1971). Third, it separates the empirical stage of *performance* from the largely analytic hierarchical complexity of tasks. Fourth, rather than basing stage on some inferred mental or logical operations; stage becomes the performances on tasks of a specified hierarchical complexity that are accomplished.

The Model of Hierarchical Complexity (Commons & Miller, 1998; Commons & Richards, 1984a, 1984b; Commons, Trudeau, et al., 1998) defines stage of performance on a task in terms of the order of the hierarchical complexity of the tasks that the performance successfully addresses. Formally, for a task to be more hierarchically complex than another, the new task must meet three requirements. First, a more hierarchically complex task and its required action is *defined* in terms of two or more less hierarchically complex tasks and their required task actions. Second, the more hierarchically complex task *organizes* or coordinates two or more less complex actions; that is, the more complex action specifies the way in which the less complex actions combine. Third, the coordination of actions that occurs has to be *non-arbitrary*; it cannot be just any chain of actions. Each new, task-required action in the hierarchy is one order more complex than the task-required actions upon which it is built (Commons, Trudeau, et al., 1998).

The MHC also may be used to measure the stages of animal or human behavior on this scale. It does so by taking the actions that animals and humans engage in, and ordering the hierarchical complexity of the tasks that those actions successfully address. Stage of performance has the same number and name as the corresponding order of hierarchical complexity of the task it correctly completes. The table below indicates how the MHC describes the orders or stages.

Table 1. Stages described in the Model of Hierarchical Complexity

Order or Stage	**Name**	**What they do**	**How they do it**	**End result**
0	calculatory	Exact–no generalization	Human made program manipulate 0, 1	None
1	sensory & motor	Discriminate in a rote fashion, stimuli generalization, move	Move limbs, lips, eyes, head View objects and movement	Discriminative and conditioned stimuli
2	circular sensory-motor	Form open-ended classes	Reach, touch, grab, shake objects, babble	Open ended classes
3	sensory-motor	Form concepts	Respond to stimuli in a class successfully	Concepts
4	nominal	Find relations among concepts Use designated concepts	Use names and other words as successful commands	Sequences of concepts, designated concepts
5	sentential	Imitate and acquire sequences Follows short sequential acts	Generalize match-dependent task actions. Chained designated concepts	Sequences of designated concepts
6	preoperational	Make simple deductions Follows lists of sequential acts Tell stories	Count random events and objects Combine numbers and simple propositions	Connectives: as, when, then, why, before; products of simple operations
7	primary	Simple logical deduction and empirical rules involving time sequence Simple arithmetic	Adds, subtracts, multiplies, divides, counts, proves, does series of tasks on own	Times, places, counts acts, actors, arithmetic outcome from calculation
8	concrete	Carry out full arithmetic, form cliques, plan deals	Does long division, follows complex social rules, takes and coordinates perspective of other and self	Interrelations, social events, what happened among others, reasonable deals,
9	abstract	Discriminate variables such as Stereotypes; logical quantification; (none, some, all)	Form variables out of finite classes Make and quantify propositions	Variable time, place, act, actor, state, type; quantifiers (all, none, some)

Order or Stage	**Name**	**What they do**	**How they do it**	**End result**
10	formal	Argue using empirical or logical evidence Logic is linear, 1 dimensional	Solve problems with one unknown using algebra, logic and empiricism	Relationships formed out of variables; words: linear, logical, one dimensional, if then, thus, therefore, because; correct scientific solutions
11	systematic	Construct multivariate systems and matrices	Coordinates more than one variable as input Consider relationships in contexts	Events and concepts situated in a multivariate context; systems are formed out of relations; systems: legal, societal, corporate, economic, national
12	metasystematic	Construct multi-systems and metasystems out of disparate systems	Create supersystems out of systems Compare systems and perspectives Name properties of systems: e.g. homomorphic, isomorphic, complete, consistent, commensurable	Supersystems and metasystems are formed out of systems of relationships
13	paradigmatic	Fit metasystems together to form new paradigms	Synthesize metasystems of	Paradigms are formed out of multiple metasystems
14	cross-paradigmatic	Fit paradigms together to form new fields	Form new fields by crossing paradigms	New fields are formed out of multiple paradigms

Measuring an Approximate g

Indexes to Measure g and Variants

Starting with the standard tasks within the standard domains, one can construct an analogue of g. There will be three types of measures: (a) the highest stage of performance attained in each domain (HS) including the highest stage in any domain (HHS); (b) a form of g that is somewhat akin to human g; (c) a derived measure of generality of performance, g breadth (gB).

Highest Stage of Performance Attained in Any Domain

An animal species may be characterized by the highest stage of performance observed with any amount of training on its best task series (HHS). Animals can perform up to the concrete stage, about what eight to ten year old children do. (Examples presented below show how the MHC can be used to compare how smart different animals are).

This first index requires some information as to what the domains are and what the tasks are within each domain. This is the most difficult part of the enterprise because we really do not know the domains well. We know what the tasks accomplish, but we do not have a systematic way to classify domains. Each task has a hierarchical complexity. The highest stage of performance (HS) is just the highest hierarchical complexity of the task that the organism in the species correctly addresses. Then one finds the domain and task in which the highest stage of performance (as determined by hierarchical complexity) occurs (HHS). Note that this falls on the stage scale that runs from 0 to 14. It is one such number.

The Index g

The second index, g, is the average of the highest stage numbers of performance in each domain (HS). This is somewhat akin to human g, but g would separate the highest stage from how broad g would be. The average has advantages of the total g, because the average is less sensitive to failing to include a domain or misidentifying a domain. Note that this average of highest stage falls on the stage scale that runs from 0 to 14.

The Index g-Breadth

The third index called g breadth (gB), measures how broad an organisms’ capability is by using a scheme that uses a renormed g that removes the effects of the highest stage. This renorming does not refer to a sample but to the process of dividing the average of highest stage in each domain (g) by the top stage of the animal (HHS). This renorming takes away the effect of highest stage. Then we have three numbers, the highest stage (HS); the average stage across domains (g); and g breadth (gB).

Within Domain Smarts

Another form of “being smart” is within domains. This within-domain form is like the subtasks within the verbal IQ tasks. The within-domain form shows flexibility of stage of performance (fS) within each domain. One chooses the domain and task in which one wants to measure flexibility, then finds the highest stage of performance (HSdomain) on a wide variety of tasks that occur within that domain (as determined by hierarchical complexity). One then averages the stage numbers of the task performances within the domain. That is g-domain. That is divided by the Hsdomain. Again, this scale will consist of the rational numbers between 0 and 14. That gives gdomain Breadth.

Examples of Comparative Complexity in Selected Domains and Species

As an example of how this works, we can first compare human way-finding to pigeon way-finding, and then include fish, horses and rats. There is a great deal of variability in human way-finding. It may be that this is also true for other primates. Some people seem to always be getting lost, whereas others can go anywhere with the most minimal directions. Such people also may use the sun to find their way. Some orienteers even think they have a sense of north in their head. Pigeons are particularly good at way-finding. They follow features (as many people do) and seem to have a magnetic portion of their brain.

But most way-finding in animals is not as flexible as in humans or pigeons. While we do not understand migration very well in birds and fish, we do know that fish swim to and up the stream where they were born. But they are not particularly good perhaps at finding other places. Birds migrate pretty much along the same routes year after year. They can find their way back to their nests. But as humans, we can make and read maps. We can find our way in any weather. We do it differently and in a more hierarchically complex manner. Humans use maps that may show contours and features such as trails, roads, cliffs, junctions, etc. The differences in complexity of each of these tasks across species could be compared with this model, given some further work in specific areas.

Jay R. Feierman (personal communication) knows horses very well. He says that they are “absolutely dumb” at figuring out problems that were not present in their ancestral environment. The fact that on the open spaces they have a good sense for direction and can always find their way home is an example of a reasonably high stage of functioning in way-finding.[2] But on new problems, they are “terrible.” Feierman says a similar condition exists for rats, whose inborn abilities allow them to be so good at mazes. Maze-like problems were part of the ancestral world of rats. But horses do better across domains than rats. They acquire a much broader amount of information, and can be trained to do a wider variety of tasks.

A second set of examples is about comparing spiders and 11 year old humans. Spiders can build webs and they can wrap their prey, but that is about it. An 11 year old can also make a spider web with a syringe filled with a protein like that in a spider web. However, they can also do all sorts of tasks beyond that. Even though they both can build spider webs, and probably the spider’s is more elegant, the fact is that the human can do so many things spiders cannot.

A third set of examples compares African Grey Parrots, Crows, and other birds. Crows perform at the sentential stage 5 (see Table 1). They sequence nominal stage actions by planning to bend a wire to reach around a corner in a plastic tube to get food. Also at the sentential stage 5, African Grey Parrots sequence words and understand word sequences, distinguishing the difference between the passive voice and active voice. But the African Grey Parrots solve all sorts of problems beyond what Crows do at the sentential stage, such as saying letters and numbers in order, and counting small sets of objects systematically. At the nominal stage 4, pigeons can switch which key they use when a few examples from a class are switched. They form a large number of arbitrary concepts even including such abstract examples as inside and outside. Hence, at the concrete stage 3, their performances are quite broad. They are trained repletely to name classes such as fish (respond quickly) to non-fish (respond slowly). When a few examples are switched so that the class name has been switched from respond quickly to respond slowly, they switch their rate for all members of the class. Sparrows cannot do such things.

The foregoing examples indicate why it is useful to distinguish domains within species, and by describing tasks that are domain specific, they illustrate that similar task domains exist across species. They suggest that animals for the most part do not vary much in their stage of performance within species. This is not true within humans. It is easy to find adults ranging from primary to metasystematic stages. There are also great differences from person to person as to their relative stage of performance on tasks in different domains.

Human Domains

There are a number of issues in examining domains in the context of humans. For example, in the postformal stages (i.e., stages 11 through 14 in Table 1) that develop only in advanced adolescents and adults, there have been very few studies of domain (but see Demetriou, 1998;

---

[2] Some primates, especially humans, have huge ranges. Other animals like elephants also have large ranges, and ranges are not linear as compared to migrations.

Demetriou & Kazi, 2001; Kail, 2004). There are at least two studies that measured postformal stages in a few different domains (Commons, Armon, Richards, & Schrader, 1989; King, Kitchener, Wood, & Davison, 1990). In both cases, the first factor was stage, with all the assessments but the Loevinger (1976) loading on it. It was more related to IQ. In each of these studies, a variety of tasks were administered. The Multisystems tasks asked people to compare four stories to each other that differed only in the way preferences or weights were ordered. In some stories, the ordering was transitive and in others that had identical structures, they were not. Table 2 indicates results from a factor analysis of how much each of the following measures loaded on the first "stage" domain.

Table 2. Factor loading on first "stage" factor of a multi-instrument study

Study	Factor Loading
Good-Life (Armon, 1984)	.85
Multisystems (Commons, Richards & Kuhn, 1982)	.75
Moral Judgment (Kohlberg, 1984)	.64
Ego (Loevinger, 1976)	.26

At one time, Piaget and Kohlberg did not think that there were domain specific developmental lags. But almost all the neo-Piagetians do. In developmental political psychology, one might consider the wide range of social domains. There has been a great deal of controversy about the nature of the social domain within the field of human development. Some researchers (e.g., Kegan, 1982; Kohlberg, 1984) held that development occurred roughly simultaneously in all domains and surely within the social domain. Fischer (1980) and many other neo-Piagetians did not think so. Armon (1984) proposed using Aristotle's classification of domains as follows: The True – Logical, Mathematical and Empirical, The Just – Fairness, The Good – Evaluative and Valuing, Beneficence – Caring, and The Beautiful. Here, Caring, Valuation and Justice are treated as all belonging to the social domain.

Social Domains and Subdomains

Each one of the subdomains of the Social Domain can be differentiated by finding people who can perform well in some of them but not others, even single others. What follows is a rough outline of the social subdomains and tasks within them.

Self

There are many bench marks in the development of the self. First, around 18 months, there is reflection on self, differentiation from others, and finally self recognition in a mirror (Bertenthal & Fischer, 1978). There are many disorders of the self, all having a different character. For example, with respect to self image, schizophrenics may think they lack a body. They may perceive the loudness of outside stimuli less than the inside voices. Anorexics may have a distorted body image and deficiency in detecting body aberrations. Narcissists perceive that what is important to them is almost always important to others. With attention deficit disorders, there is inattention to others.

Dyads

Intimacy has all the social perspective taking stages of Selman (1980) as modified by Commons and Rodriguez (1990). At the primary stage seven, one can take the perspective of oneself and one can take the perspective of others but not at the same time and not coordinated. At the concrete stage, decision making leads to agreement between two people based on each person understanding the perspective of the self and other at the same time. Intimacy develops finally at the metasystematic stage to the extent where people can become interdependent without giving up their own identity or dominating another.

Alliance and mutuality has a stage sequence also, paralleling the development of social perspective-taking. For example there is turn-taking in infancy at the beginning of the circular-sensory motor stage two. It has been observed that communicative interaction, as shown by eye glances that begin to take place from the first week, gradually develops into an interaction with sounds where the adult talks and the child is cooing and beginning to play peek-a-boo (Commons, 1973; Lobel, Miller, & Commons, 1981).

Lamb (1991) has show that the development of empathic responses at the beginning of the nominal stage 4 around 18 months is a precursor of moral development.

Triads

During the primary stage, one sees games involving groups of children. These can be small teams as in kick ball, dodge ball or jacks. This becomes the basis for small working groups or small committees. Decision making becomes an issue. Sometimes there is a consensus and the group stays together. Sometimes there is not and the group might split. At the concrete stage, the use of power becomes more apparent.

Committees

At the abstract stage 9, committees come into being. They consist of three or more people but not so large as to be an organization. There are social norms that play a significant role here.

Small Organizations

These can also be formed at the abstract stage 9. They may consist of single purpose large ad-hoc committees and simple non-differentiated organizations without departments. Roles are somewhat differentiated but also quite interchangeable. Such groups are governed by social norms and do not have to be face-to-face.

Small Markets

Small markets are an example of this level of social subdomain. For instance, in developing countries, there are usually open air markets with lots of vendors selling products. Many of the vendors sell the same products. There may be price, quality, and freshness competition. Flea markets are also of this sort.

Organizations

An organization is a group of persons organized for a particular purpose such as a political association or a business. Within organizations there are rules for cooperation as well as for competition among subunits of the organization as is the case with sports teams and candidates.

Public

This is a different kind of activity in which people have an imaginary audience or at least one they cannot see. This first happens at the formal stage 10. This is the lowest stage of performance for politicians, actors, musicians and writers among others who have a special sensitivity as to what works with the public. They are successful at communicating with the "everyman." We say they are successful if they are elected and if they are there more than one term or have more than one movie or album success. This is a domain unto its own. Think of higher stage purveyors like Ronald Reagan, William Clinton, Tom Hanks and the Beatles as exemplars.

Governments and Large Markets

See Sonnert and Commons (1994) for a discussion of the higher stages in the political process. Sara Ross (personal communication, January 2006) suggests one might look at the list of the often-used socio-political domains as shown above. One could relate them to socio-political structures at different stages of development. Then one could come up with stages of performance necessary in those domains to function well within those structures. One could design a semi-structured interview-scenario that included elements we think of as belonging in those domains (moral, interpersonal, etc.). We could use that to probe people's experience, attitudes, etc., in relation to how they think, react, function in regard to certain institutions and also other people who have roles in those institutions. Then one could come up with a score for each domain included in the interview's scenario. One might be able to predict where they could have problems and where they could benefit from further development.

One could conduct an experiment designed to improve performance in socio-political domains, by using Sara Ross's public issues process for example, and do the interview again, and score them. One could see if that intervention broadened them by increasing g, finding out which domains the intervention impacted, person by person. People could benefit personally and collectively, and the intervention could be revised and improved to target certain domains more specifically for more beneficial results.

Societies and Cultures

Some people, such as artists and scientists, have a great understanding of societies. They not only produce original works, but often understand how to market them to the society as a whole. For example of cultures as a whole, we speak of Western culture or Eastern culture.

Other Domains

There are other kinds of domains of knowledge in humans. People seem to vary in how well they do in them, so there might be some modularity associated with them also. A list of such domains includes:

- *Physical Science domains:* These include Physics, Chemistry, Organic Chemistry, Astronomy, Geology.
- *Biological Domains:* These include Biology, Biochemistry, Zoology, Botany, and their subdomains.
- *Analytical Domains:* These include Philosophy (which includes Epistemology, Morality and Ethics, Aesthetic, Logic, Metaphysics) and Mathematics (which includes such areas as Mathematics, Probability and Statistics, and Chaos Theory).
- *Experiential Domains:* There are two major experiential domains; Religion and Spirituality, and Art, Music, Performance, Communication and Persuasion.
- *Physical Skills:* These include sports, dance, military activity, equipment operation, playing instruments among other things.

Conclusion

The issues of modularity and generality in intelligence are not going to go away. This paper has presented one way to address the controversy, to keep modularity but measure general development across domains. Using such measures will help us understand the evolution of animals. It will also make clear that many of the problems people suffer from are not due to “bad’ will, but due to deficits of development in given domains. Such unevenness in development seems to be associated with problems such as criminal activity, substance abuse, etc.

This theory of g may enhance the Model of Hierarchical Complexity’s utility, as a formal theory now supports its development (Commons & Pekker, in press). It may also iterate a few of its key potential areas of value. There are clearly a number of challenges in fleshing out this theory in detail. One way to validate such a system of measurement could be to systematically compare a number of animals using the methods briefly described in this paper. However, it takes a great deal of time to test individual animals or humans on a large set of tasks. Therefore, at least with animals, it is probably best to analyze the tasks they do and how they do them. By determining the hierarchical complexity of the tasks, one can determine the stage of performance, which requires only scoring.

The Centrality of Human Development in International Development Programs: An Interview with Courtney Nelson

Russ Volckmann

For over forty years Courtney Nelson was engaged in projects in Africa, Asia and the Middle East that were focused on trying to make a positive difference in the lives, work, and organizations of people confronting rapid change, new demands on themselves and their families, and worldwide economic and political forces that few understood. Courtney's integral perspective is evident here as he forges a clear presentation of the relationships among variables in development.

Human development tends to be an afterthought in the design of most development projects. The focus of interventions is likely to be economic development, institutional development, infrastructure development, etc., but the impact of the activities on the level of consciousness of the participants is a secondary concern.

Education is the high road to human development, but even education projects can fail to achieve significant advances in human development. Rote learning, for example, or training narrowly focused on work skills, can miss many potential developmental benefits.

My contention is that if economic, infrastructural, institutional, and educational interventions were designed with the human development of participants as a primary objective, the projects would be more effective and their benefits more lasting. To achieve harmony among the level of human development, complexity of technology, and management style, one would necessarily begin with the developmental stage of the intended workers. One would then select technology that was at the same level or one step above that level and design a management system consistent with the technology and the workers.

Once the three elements are in harmony it would become possible to manipulate policies (incentives), technologies (capital intensity) and human development (through training) to achieve sustainable development one step at a time. This, essentially, is what Singapore has done to create an advanced society with a highly advanced population in the course of a mere two generations.

Courtney Nelson

Q: Your work history has been quite extraordinary in terms of just the years you've spent involved in development activities in Africa, the Middle East and Southeast Asia in particular. What experiences have helped shaped your perceptions about development?

A: First of all, I am a generalist. Working in a discipline allows one to delve deeply, while being a generalist helps one have a broader view. The hard part is finding employment because organizations are generally looking for people in a disciplinary framework. I have been fortunate in finding a broad range of employment opportunities, but there were times I wished I had a definable, disciplined skill.

Looking back, I find that in one way or another I have had experience with the three main facets of the development process: organization, technology, and human development. Over time, through prolonged exposure, I felt these facets began to fit together.

At the beginning, I was working with a man named Lothar Metzel who was an East European immigrant analyzing Chinese communist pronouncements. At the same time, he was grounding me in Marxist and Leninist literature. The most influential book for me was Karl Wittfogel's ***Oriental Despotism***. Wittfogel was once the number two German in the Comintern in Moscow. After rejecting the Party he used Marxian analysis to study the ways in which the need to control water, either for irrigation or flood control, shaped a number of Asian societies. If a society needs to control water, it forms the kind of relationship between the state and people that can be leveraged for other activities. Only societies where you have such water control can you build massive monuments such as the Great Wall of China or the pyramids. Those achievements required the virtual enslavement of a lot of people.

Such despotic control over society was possible only because water control demands arbitrary organization. Decisions concerning water control measures must be made firmly by an authoritarian entity, they cannot be subject to discussion or debate. This is an extreme case of technology determining organization which, in turn, determines the level at which people must function. Once the mechanisms were in place for managing the technology, rulers could use their complete control over their subjects for building massive projects. Such projects could not be built in the West because, being well watered, outlying vassals could and did break from a kingdom and join the other side if the kingdom made repressive demands.

I found similarities between Wittfogel's theory of hydraulic society and Soviet ways of controlling their people. They used ideology rather than water control. They used the party line to control people at all levels of society. In a hydraulic society, the technology needed for water control enabled, and practically forced, a highly centralized political system, whereas the communist system was based on no such imperative and had to eventually fail.

Later, I spent a year working with state advisory committees to the U.S. Commission on Civil Rights. It was fascinating to see the different means chosen by these voluntary committees to deal with the specific civil rights problems of their own states. I met a great number of admirable people all over the country. Still, it wasn't international and I yearned to be back in the field.

I was fortunate to get an interview at the Ford Foundation. Frank Sutton, a sociologist on the Foundation's staff, was about to open an office of the Foundation in East Africa and needed an assistant in that endeavor. The interview lasted a full day and I was dazzled by the people I met and their sense of mission in developing countries. At the end of the day I met with the personnel director to discuss terms of employment. I said I would go for the fringe benefits; I was so eager for the assignment.

Q: *So you went to Kenya?*

A: Yes, I had a two-year appointment, which became four years. It was a terrific learning experience because I was working for Sutton. Like Metzel, he was an able reference librarian on virtually every topic I took an interest in.

Q: *What most interested you in Kenya?*

A: East Africa has many fascinations. I got very interested in ecological research on wildlife and developed grants in all three countries: Tanzania, Uganda and Kenya. I even learned to fly so I could visit the research stations without devoting a week to each visit. This is when I began to get interested in human development. The Foundation necessarily worked with the elites of these countries. We were engaged in supporting economic planning, Africanization of the civil service, higher education, etc. We had one small project improving the school science curriculum, but our resources did not extend to the point where we could be productively involved in primary or secondary education.

Many of the people we worked with were outstanding. Tom Mboya and Julius Nyerere would have been leaders in any society. They had generally been educated, first at an elite high school, such as Alliance in Kenya, and then sent to Makerere University College for higher education. Many proceeded from there to study overseas. The gap between these people and the man on the street or in the field was enormous. One had the feeling that we were working on the surface of African society, while in the villages and countryside another generation was growing up with the same limitations as their ancestors for centuries past. Moreover, independence and democratization meant it became impossible to support the elite school system, so there was little chance to continue producing the admirable elite such as we knew.

Without much hope of doing anything about it, I tried to discover what made the great disconnect between the "been-to's" (e.g., been to England, been to the U.S.) and the others in their society. I became acquainted with John and Bea Whiting and Bob Levine, all social psychologists from Harvard who were undertaking field studies on child rearing in up-country locations.

A change occurred in the "been-to's" that was more profound than the knowledge that they gleaned from their studies. You would not recognize them as the people from whom you would draw your servant class, for example. They were very different people. One wonders how that can happen from the same population. I started reading child development books with guidance from Sutton, the Whitings, and Bob Levine.

Q: *Human development, not economic or political development?*

A: Yes. Their work fascinated me.

The Foundation decided to send me to Harvard after four years in East Africa. I went to what is now the Kennedy School, but was then the Littauer School of Public Administration. I was able to pick my program. While it was a degree program, the degree was less important than filling in the gaps of my knowledge, because my educational background had been very feeble. At Harvard I took a lot of development courses, economic and others.

I wrote a paper about Julius Nyerere's policy. Nyerere was the philosopher king of Tanzania. He was very personable and well intended—a very fine man without a corrupt bone in his body. At one point he took leave of his presidency and went into the countryside and visited small villages and towns. Then he paused in Arusha and wrote guiding principles for the government, which spelled out education policy, agricultural policy, rules governing the civil service, etc. An example of these principles is that farmers should not get help with their harvesting or planting, because that would constitute exploitation of the laborer. I wrote about his ideas on education, organization of government and things like that. They were well meaning, but many were unworkable.

There were only 100 college graduates and 1,000 high school graduates in the whole country when Tanzania became independent. Yet, Nyerere tried to set up a state-run system. The state machinery was pretty crude. As a result, it led to a lot of corruption and failure.

Somehow, David McClelland heard about my Arusha paper. He invited me to address a seminar he was running at MIT.

Q: *Were you studying with developmental psychologists?*

A: No, I was not working with psychologists at all. I was working with economic development people. I was, however, reading some psychology books, such ***as Stability and Change in Human Characteristics*** by Benjamin Bloom. It showed that the traits that differentiate among people can often be recognized in children as young as three. By age three the path ahead is already visible. That book was influential on me, because the Foundation and other development programs didn't pay any attention to people from zero to three. This was an area that nobody knew how to get to. It seemed to me that while we were working with the advanced, the elite, in countries like Kenya there was another generation of people—like those who we hired as servants—we weren't touching at all.

At that time I also read some work by Israelis who were concerned about child development in Kibbutzim. They were particularly concerned about the different cultural levels that seemed to be produced out of their European and Sephardic populations. The Jews from the Arab countries lagged behind the Jews from Europe.

They were trying to close that gap and so they did a lot of things with different kinds of interventions at a very young age. I think their focus was around age three. They had different control groups involving the Ashkenazi or German/Northern European Jews and the Sephardim, Jews of Spanish or Portuguese descent. There were some comparisons between Ashkenazi experimental and Ashkenazi control groups, as well as Sephardim/Sephardim, Ashkenazi/Sephardim experimental groups, etc. So they tried to figure out what was causing the difference. They found that by intervening and producing an enriched environment for the children, all of them advanced greatly, but the gap between the experimental groups widened. That had a big impression on me because it appeared that so many human traits were established by age three.

Q: *Do you mean that the Ashkenazi still accelerated their learning or their development faster than the Sephardim?*

A: Yes, the Ashkenazi were even further ahead of the Sephardim, although both were way ahead of the control groups that had not had special interventions. That's a very puzzling thing because both of are Jewish populations. That doesn't mean their genetic code was the same, yet it was startling to see that even with extra attention, if everybody got it, the Ashkenazim progressed even further than the Sephardim. This seemed to imply that the book on stability and change in human characteristics was right—that people's potential was set by age three, the time they started on this Israeli program.

Q: *It seems like so many of our developmental programs and theories are built around the idea that anyone can be developed as much as they want to be. What you are suggesting is either the genetic or the environmental factors that we encounter are basically determinants of or set boundaries on that development. Clare Graves makes this point, as well as a colleague of mine, Mike Jay, who says, "Everybody can't be anything they want to be, but they can be everything they can be."*

A: The environment of the first two or three years of life is critically important. I think we often overlook those kids of very young age. In the Kibbutizim they were separated from their parents at a very young age.

Q: *Because they were raised communally, right?*

A: Yes. That's what puzzled them. They had the kids at a very young age, but still there were these differences and the differences would only grow. I still don't know the answer to that one.

Q: *I know you continued to have conversations about human development particularly among children when you were in Beirut and probably elsewhere. What I'm getting so far is that when you are talking about human development as it is among children. I read in one of your papers that this shifted to an interest in adult development.*

A: Yes. When I was in Beirut, I was convinced that the really important development occurs between ages zero and three. As I say, development agencies just were not having an impact on that level at all. Most of my budget was going into agricultural research, agricultural economics, and education. I was able to put little bits of discretionary money into a couple of projects that related to this idea.

One was a study in Oman of mothers' beliefs and practices. We got four Arabic speaking young women to go to Niswah, which was an interior village, spend four months and then move to Sofar, a village on the coast, for another four months. An anthropologist, a psychologist or sociologist from the University of Beirut, guided their methodology. A fairly massive study was produced out of that.

The reason that the intervention happened in the first place was that the infant mortality rate of the kids in Oman was 150 per 1,000. A UNICEF staff member, a Palestinian named Ali Othman, observed that the surviving children had little amulets hung on them in various places and he reasoned that the mothers probably thought those amulets were protecting their children from evil spirits. He came to me and suggested a study of this phenomenon. I funded it through UNICEF. It turned out later that UNICEF can't take that kind of money, but they took it then and used it to fund these young people.

The results were really quite extraordinary, because they demonstrated what the women believed. The child rearing beliefs and practices were just bizarre. They were doing everything they could think of to protect their children against the evil eye and the jinn, but they had no idea or concept of disease, the origins of disease or the importance of keeping a level of sanitation around the child. They were letting kids pick up stuff off the dirt floor and put them in their mouths. They didn't bother brushing the flies from the kids' eyes. In the schools there were about a third of the kids with obvious eye damage. What the mothers were doing was trying to protect the kids against the evil eye and jinn and not against the sources of disease.

It seemed pretty clear evidence that when one is going to intervene in a society at whatever level, one ought to know where they are. You start with the people you are trying to help and where they are in terms of their attitudes, beliefs and practices. Then start figuring out how to change it from there.

The government of Oman at that time—just after the new sultan Qaboos had overturned his uncle—developed the country just as fast as possible. But the projects did not involve the people. They would have big construction projects—airports and roads—but import all the labor from Pakistan and India, because there wasn't any trained labor in Oman. Teachers in their expanded school system were usually Palestinians who used European history books because that's what they had been taught. Even the agriculture research station was producing vegetables that only the foreigners would eat because the locals didn't have them as part of their diet.

The Omani officials said that they learned a great deal from this study about the children, but they would not let it be published because they found it too embarrassing for Oman that these primitive beliefs were so common. UNICEF was there to use the information in crafting their efforts in dealing with children, child development, and child mortality. When I went there 10 or 15 years later, the infant mortality rate had come down to about the level that it was in other Gulf states.

Q: *How big of a drop was that?*

A: It was from 150 per 1,000 down to around 40 per 1,000.

Q: *That's very significant! This was done primarily as a result of this study through a shift in educational systems?*

A: No. I don't know what UNICEF did with the study, but they knew that what they were dealing with was a set of very primitive beliefs. They needed to attack those beliefs and educate the mothers to the importance of disease if they were going to make any real dent in it. Indian doctors staffed the hospitals; many of them couldn't even talk to the people who brought their sick in. Mothers had gone through all of the culturally sanctioned ways of dealing with the disease before they brought them to the hospital. Of course the mortality rate in the hospital was huge, because the children were already pretty far near the end when they arrived. UNICEF probably used this information. I'm not sure. They had it so they could start introducing basic concepts of disease causation.

> ***After forty years in the field of international development, I have concluded that most development strategies are misguided. Human development should be the primary goal of the development process because advances of living standards, health, and knowledge can only be sustained when people progress up the scale of increased consciousness. At present, human development, when it occurs, is a by-product of efforts designed to achieve other objectives, such as income generation, health, environmental protection, institutional development, etc. These are all worthy objectives, but they should be pursued with the primary goal of human development uppermost in mind.***
>
> ***Courtney Nelson***

Q: *How does this link to your interest in adult development?*

A: After this study, Ali Othman's wife, Saniyah, and I were talking. She had a year or so of college level psychology and said that she could produce a book for the mothers of the Levant: Palestine, Lebanon, Syria and Jordan. Women in these countries had a higher literacy rate than those in Oman. They were much more cosmopolitan than the Omanis, who had been shut off from the rest of the world for a very long time. Saniyah produced a book called, ***Your Child Zero To Five***, again with a small grant from me to UNICEF. It became a best seller and went through at least four printings before I lost track of it.

Saniyah emphasized the importance of what happens to the child in the first years of life. The traditional beliefs were that you treated a child like a goat; you kept it healthy, but you didn't try to teach it anything. She was making the point that you need to be consistent in your behavior toward the young. You shouldn't use fear for behavioral control. You shouldn't lie to them. A doctor would say, "This won't hurt" and then stick a needle in the kid and he would jump through the roof. That had a predictable impact on the child's faith in what older people said.

Saniyah also included illustrations of where the baby grows in the womb. I was told that that was one of the most popular features of the book, because many women didn't understand that. For the women of the Levant this was pitched at the right level, because it was done by a woman from that surrounding.

Q: *What were your next steps?*

A: After Beirut, I did an evaluation of Foundation economic planning and management projects in Eastern Africa. Economic planning projects were usually a big success. The relative failures of management projects led me to realize that the institutions left by the British in East Africa were very often not compatible with the beliefs of the people who were running those institutions after independence. For example, in Parliament a tribesman from the Luo tribe would get up and denounce some Kikuyu in the government for giving a fellow Luo a bad performance rating. They had the performance rating system, but it didn't take into account tribal identity, which was more important to them. Tribal morality was more important than the idea of public morality that the British had left. Economic planning, on the other hand, had less of a cultural flavor. In a sense, it was more impersonal than management that deals with interpersonal relationships.

So you have these dual moralities in the same system. This was one of the reasons the British institutions hardly ever took hold and lasted, except in India. India still has a parliamentary system and it's a real democracy. But in other places, British institutions came apart in various ways because they did not take into account personal morality. It was very different from public morality.

Before I left the Foundation, an economist from Harvard, who was running a study at Brookings on development and foreign assistance, tapped me to help President Carter, who was a new president at that time, do a better job of foreign assistance by understanding the problems. My part of the study became an appendix to his work. I was dealing with science and technology.

My assignment was technology transfer, but that was a little limiting. I came out of it with a proposal that a new assistance institution be set up which would work with scientists in developing countries who were at a fairly advanced stage. USAID at that time abandoned a country once it reached a certain level of income, except for Israel. Most of the intellectuals of many middle-income countries were trained in the United States. Then suddenly, boom, they were cut off from their U.S. institutions and were very unhappy about that.

It didn't seem to me to be in America's interest to just lose track of these third world scientists and technologists. The approach I recommended would cater to the middle-income people. It would be organized by field of expertise and would connect American institutions with overseas institutions. We went through a couple of years of planning that. Congress approved of the idea and then didn't fund it, so it died. That was the time when I focused more on the importance of technology in the development process because a lot of people were talking about appropriate technology at that time. It is a very important concept.

Q: *The issue of technology was something Gandhi talked about in India. That's where the whole anti-Videshi movement (resistance to foreign manufactured goods) under Gandhi's leadership emerged. He sought to promote simpler technologies through the Swadeshi movement.*

A: That's right. Gandhi's plan was to introduce simple technology that could be afforded and understood by the people who use it, for example the spinning wheel and weaving of cloth on traditional looms.

Q: *Yes, the spinning wheel is the symbol of it all. It's even on the Indian flag.*

A: That's a very important concept and I don't know that it made much of an impact in or out of India. I don't know how much people changed their development activities.

Q: *At least from a foreign USAID point of view, Americans continued to focus on bringing advanced technology to the third world. Is that a fair assessment?*

A: Yes, I think so. Considering the importance of technology, the notion arose that the technology needs to conform to the level of the people and needs to be appropriate to the level of the people.

Q: *When you say "level" of the people, what do you mean exactly?*

A: I think the concept of levels or stages as in Piaget's work. It is useful in considering, not only human development, but also stages of technology and organization. I can't define these stages precisely, but in defining interventions in a society it is useful to be aware that workers need to understand their technology and that management systems need to be consistent with the stage of the workers. Societies are also at various levels of development, as demonstrated in Michael Barnes' ***Stages of Thought*** (2000). This idea is based on the notion that people in all cultures go through the same pattern of human development. It is not cultural relativism. Japan and the Asian Tigers demonstrate that societies go through roughly the same stages of development, as do their workers. It is even possible for the successful Asian countries to borrow technology, management techniques, and training methods from the West, and vice versa.

In the Gezira, the colonial government of the Sudan of the 1930s took some nomads from the area around the conjunction of the two Niles and put them on a million acre irrigation scheme. They gave these nomads tenancies in the scheme. This was a great boon to them because they also provided education and health services. But after two generations these tenants were doing everything they could to get their children not to be part of the scheme, because it was drudgery. So at the beginning, it was a step up from semi-Nomadism. Then irrigation is commonly recognized as dehumanizing in the fact that you bump your head on the ceiling very early, because there is no room for individual decisions in the application of water. It has to be there when it's needed. The opportunity for individuality to be expressed is zero. That is one level to another, transformation from semi-Nomadism to irrigation. Incidentally, the Gezira Scheme has been recognized as a great success in many evaluations, but I have not seen the human development successes of the project mentioned. I think human development is the principle lesson of the Scheme.

Q: *When you're talking about development in this sense, you're talking about their orientation to modes of production or to education or what? How would you characterize that?*

A: The most persuasive example of the step by step development of a society and its people is Singapore. In Singapore, multinational corporations were invited in at Independence because of the cheap labor and the technology used was quite simple. But then Lee Kuan Yew, the president, put a lot of emphasis on education and training. He forced the multinationals to do a lot of training of their staff and gradually raised the minimum wage. This had the effect of raising the level of technology used because you had to have higher productivity of labor in order to afford to pay the higher wages. That means the laborer had to be more skilled and more educated in order to use the more advanced technology and the wages had to be commensurate with the level of technology that was employed. I don't know what scale one would use to measure this process, whether there were stages or just a gradual change in the abilities of the workers. But after two generations, the Singaporeans topped the world in academic test scores and it enjoys a very high standard of living.

> ***An important element in…human development …is the parallels between levels of human development, levels of organizational development, and governmental organization. That is another way of saying that as the modal level of individuals participating in organizations or societies increases, decision-making devolves downward in the case of organizations, and societies become more democratic, or at least they should for optimal effectiveness. The notion of a parallel structure ideally existing between modal human development and organization is not commonly found in social science literature, although authors like Ken Wilber, Dalmar Fisher and William Torbert have dealt with it to some extent. The implications of this…are that we should not be quick to apply our own standards of democracy and rights to other societies and cultures without understanding their circumstances.***
>
> **Courtney Nelson**

Q: *Are you familiar with Spiral Dynamics?*

A: I'm familiar with the concept, yes.

Q: *Are you really talking about a worldview shift as a sign of development, those worldviews based on one's orientation to self and to other, as well as the standards that one goes by? Standard may not be the right term. For example, we find in lower or earlier stages of development an orientation to personal power and that shifts into an orientation to community standards, rules, ideologies, religious beliefs and so on. This is a complex scheme, but part of what you are talking about is worldview.*

I remember in terms of development in India back in the early 60's, reportedly one of the first things young Indians would get when they started earning a little money was a pair of sunglasses. This of course, shifted their worldview. They saw the world differently through sunglasses. The next thing they would get is a bicycle or a portable radio. I can't remember the sequence of those two, but those were the three new technologies for personal use that they tended to acquire. Each of them, of course, altered their worldview, because with the radio you got music and news and information from a much wider area of the world while the bicycle gave you extraordinary mobility. So that is the kind of shift that I think of in early stages of development for individuals. Does that resonate for you at all?

A: Yes it does. That is very much what is going on. What is hard to do is to relate that to stages of human development and to prescribe what technologies fit what stage.

Q: *Maybe what we're talking about is a shift from pre-modern to modern.*

A: Yes, I think so.

Q: *Can we focus this more on the question of what became your view of the relationship between adult development and organizational and technology development in the third world?*

A: It was a gradual shift. In the mid-1980s I was sent to Indonesia by Harvard to work on a project for selecting and preparing Indonesians for graduate study in the United States. They were to study mostly management and economics. That led indirectly to my going back to Indonesia later to work for the official I had worked for initially. He had been promoted to Minister of the Cabinet. He ran the Secretariat of the President. He observed that the quality of personnel in the Secretariat was much lower than in the planning ministry where he had served before. He wanted me to think with him about what to do about that.

I talked to the department heads in order to find out what their units were doing, whether they made any regular written reports, and what they thought their units should be doing. After we did this investigative process, we decided that modern management is mainly about communications. Therefore, the communication skills of the staff were going to be increasingly important.

According to Presidential pronouncements the first 25 years after independence were devoted to internal development of the country and holding it together. The next 25 years would require that Indonesia be more international. Thus, foreign languages were important. A program was devised to teach English and computer use to 20 young staff members. After they successfully completed the English part, they were sent to Australia where they were given an opportunity to observe how the Australians do the same kind of functions that they were doing in the Secretariat. Then they were asked to write papers making proposals for improving the functioning of the Secretariat.

When those young people came back, the change in them was absolutely extraordinary. In the Indonesian culture, subordinates are not supposed to give advice or recommendations to superiors. These people came back with firm recommendations. They were articulate. They were just extraordinarily able people. They stayed together after that experience and, as far as I know, they are still meeting together. There was certainly adult development involved in this. I didn't expect changes to that extent would occur. It was very surprising to me that they were able to speak right up and weren't forelock-tugging, "I'll do whatever the father tells me to do" characters. They were people with their own ideas and not afraid to say them.

Q: *So that does imply a kind of shift in self-concept and a shift in worldview, as well as learning about cultures and systems other than the ones that they had traditionally been associated with.*

A: Yes—and giving them new tools.

Q: *And the new tools in this case were?*

A: Language and computers.

Q: This in turn affects worldview. Good. As a result of this, when you were thinking about adult development, it sounds like you were thinking about the existing culture, the technology or tools and the individual experience and capacity for learning; does that summarize that?

A: That's right. We weren't creating a revolution with these people, but we were giving them new opportunities and new learning so that they were able to put behind them the kinds of cultural limits that they had had before and to express their ideas. I'm sure they had ideas before, but were not encouraged or permitted to express them in most offices.

Q: Did this lead to a significant shift or effort on your part in trying to expand the way we were thinking about development to include human development?

A: Very much so. This experience was really very successful in my eyes and in the eyes of this Minister. He wanted to see if we couldn't spread this experience throughout the government so that people would get a new kind of retraining.

My ability to work with them was cut off shortly thereafter when Suharto was thrown out of office. The Minister went with him, so nothing happened after that. But these ideas about development and change also permeated a set of consulting assignments that I had from the United Nations Development Program. They had the task of sending out diagnostic teams to figure out what needed to be done to improve the civil service in various countries. They sent me to six countries, starting with Iraq, which was a real hoot.

Q: Why did you say that?

A: We were told when we went there that they didn't want our ideas on economic policy. We were there just to advise them on how to make their civil service more efficient.

Q: Was this under Saddam?

A: Yes. It was right after the Iran/Iraq War and before the Kuwait invasion. They had even abolished their extension service to the farmers. They cut off upward flow of information, so they didn't know what the farmers were thinking, what their possibilities were or anything else. It was "top down everything".

The people we talked to, except for the Ministers, were just scared to death. They saw no possible advantage and a lot of possible disadvantages in talking to us. It was clear that what they really needed was some way to express and to apply themselves more broadly.

People in the universities stayed in the universities and government stayed in government. We recommended things like having consultants to government from the universities and a year off for reflection for senior officials and stuff like that. We suggested better utilization of manpower and a different incentive system so that they weren't rewarded primarily for their loyalty, but they were rewarded for their accomplishments. We were able to say that kind of thing because we were from the U.N.

Most people would hesitate to say things like that. But we couched it well and one of the Ministers told us that he found our report very useful. But then they invaded Kuwait and forget about the rest of it.

In the quest of many of these assignments, it became clear that the transfer of skills and opportunities in the civil service was important, as was the notion that administration is a profession and not just a position. For example, Oman was going through the process of getting rid of the Indians, Pakistanis, and Brits in administration roles and replacing them with Omanis. But the Omanis didn't always understand that that meant they had to know something—not just have the power, but also have skills. Development administration was a skill that could be learned and taught.

Q: *This professionalization of the civil service that you're talking about is exactly the heart of what India was able to sustain from the British colonization—the Indian Administrative Service. That professionalism of the civil service was at the heart of much of India's economic and human development in terms of education and other programs related to social issues that they've had in India.*

A: Yes. They had a highly developed professional class at the top in the administrative service. They had patterns of communicating with one another. The idea of putting a minute or update on the file to capture and maintain information was deeply engrained. That wasn't deeply ingrained in countries that didn't have Britain as their colonial master. Many had oral cultures. That's what was in the President's office in Indonesia—an oral culture. They produced practically no paper.

In an oral culture people can change what they said before, so you have to be tuned in to what they are thinking now, not what they said before. There are a lot of reasons why a written culture is more efficacious, but getting that shift is a big challenge.

The other shift is from being loyal to an individual to being loyal to the service. In most of the non-British former colonies that I visited, the ministers were the heads of their departments in a personal sense. The people working for them were loyal to that minister. The idea of transferring from one ministry to another was not popular, because that would mean shifting one's loyalties. Even communication between ministries was a problem. It would get you nowhere, because the only communication that mattered was upward to the minister.

One of the things that I did in Indonesia and other countries where I was consulting was to try to open lines of communication between ministries, mostly through using computers, budgets and stuff like that. Thereby, the habit of communicating with other ministries became engrained and the loyalty of the person was to the service and not to the minister, whoever he happened to be. That communication thing is worth dwelling on for a few minutes because in Indonesia, they had the Dutch as colonial masters. The Dutch allowed very few people to get a higher education. When they got higher education, they didn't want them back in Indonesia.

Three professional groups emerged from different kinds of training. One group was the military. They were very important in Indonesia and even had economic roles. During the war against the Dutch, Ministries had to run economic activities in order to fund their own functions. The military group is probably the most powerful because they learned to do this well. The second group is the economists. They are also a clique, a very well educated bunch. Most of them had advanced degrees from prestigious American universities. The third group was the technologists. There was an airplane engineer named Habibi who believed you could leapfrog in the development process and go right to the most advanced. Habibi was raised by Suharto, so he had special access to him.

Q: *You're talking about leapfrog in terms of technology development?*

A: Yes, in all senses: technology, education and what not.

Q: *I don't understand the idea of leapfrogging in education development. Can you clarify that a bit?*

A: Have a select group going to the advance levels of education such as Ph.D.'s, and engineering degrees. In other words, they said, "We are just as good as anybody else, so we'll take the leap and get them trained to the highest point and they will come back and work in our modern industry sectors," which was airplane building and ship building.

Q: *So you mean developing a class of technologists and managers to accelerate economic and technology development?*

A: Exactly. They were trying to apply the most modern technology to airplane development and shipbuilding. This was contrary to what economists were saying, because it was creating an island of plenty in terms of technology and money in a sea of people that has otherwise not changed much.

Q: *It was still essentially an agricultural economy?*

A: Agriculture and also the civil service, the merchant class and stuff like that.

Habibi got the money to start these really modern industries. They developed an airplane of their own design. The only customers were the military of their own country. They were customers because the president told them they had to buy from Habibi's industry. It was a huge waste of money, but it was also a distortion of the development process. You got these people who didn't think at all like the common Indonesians, they were modern men, transported into this elite environment. Modernity was the watchword.

Those three cliques communicated mainly internally. In each group, communication was easy because they knew the same terminology and they could trust each other. So there was an economics group that talked in terms that were understandable by any economist. The technologists had their own circle of communication related to technology. The military people had their own style of communications. There were barriers around each of these three groups.

Q: *By barrier, you mean they would not communicate across the boundaries of these groups?*

A: Yes.

Q: *So the barrier could have been a social barrier or the various educational backgrounds these people had?*

A: Yes.

Q: *Were any of the barriers ethnic? Were all of these Indonesians as opposed to Chinese and that sort of thing?*

A: No Chinese, but in some sense they were ethnic in that the Javanese ran everything.

Q: *So all three groups were Javanese?*

A: They were mostly Javanese, yes. The man I worked for happened to be from Borneo. He was of the economist group. When he got his promotion to be a Minister in the Secretariat, the chief economist told him, "Don't do anything for two years." He said, "You're the first non-Javanese and non-military person to hold that position." He was known as a good administrator.

Q: *The barriers were essentially cultural and social?*

A: They were professional. They talked the same language; they had the same value structure. The technologists couldn't understand why these dumb economists didn't want them to have the best aircraft industry and ship building industry that was possible. It didn't make any sense in economic terms, but the technologists didn't speak in economic terms. That is an extreme case where developing means of communication among ministries and among groups was an important step in the development of the whole civil service. You had these isolated blocks and you had to figure out ways in which information routinely circulated among the ministries to break down the barriers between them. That same kind of thing was apparent in Iraq, Oman, all of those developing Arab countries where they had the same deal: being loyal to the individual and not being loyal to the service.

Q: *You're trying to show the link between the organizational, technological and human development processes?*

A: Yes, that's right. It is clear that in designing projects foreign USAID agencies tend to be concerned with outcomes that may be economic, educational or technological. They may introduce new technology for cattle raising or something like that. They tend to be concerned with specific outcomes while letting human development come along behind. They would train the people needed for their particular project, but they didn't start with where the people are and design projects based on their needs. They didn't design technology within the understanding of the people they were assisting.

Q: *It seems to me that in the history of developmental activity, at least on the academic side, if not on the practice side in the field, there has long been attention to questions of educational development, culture change, system development, technology, growth,* *economic and political development. These have all been fields of study, fields of theory development. Presumably each has had some influence on practice in the field. What is the added idea that you are presenting in terms of the relationship between human development, technology development, and organization development in systems?*

A: Designers of development projects should start with human development as a primary objective and then get into the technological, organizational and managerial implications of that.

Q: What would "starting with human development" look like? Would it be a focus on education such as the Indonesian example that you gave? Would it start with early childhood development or maybe all of the above? Is there a whole array of interventions that you have in mind?

A: It is all of the above.

Q: What are the kinds of human development interventions that you think are important for other aspects of development? Where would you start?

A: The human development objective needs to be primary in virtually all projects. When everybody became excited about environmental and ecological values, means were devised for project evaluation to include those values. The same thing could be done with human development. You would just evaluate what is happening to the people in the process of any project, and build human growth into the benefit side of the cost/benefit analysis.

Q: You've given examples where it seemed like human development was part of the evaluation in terms of changes in child mortality rates, the role of the newly educated people in Indonesia and that sort of thing. Recently in the ***Integral Leadership Review****, I published an article about a UNDP leadership program in Africa, Cambodia and five countries in the Caribbean. They found that as they introduced these programs among women in Cambodia, the incidents of AIDS went down. I would think that would be another example of the idea that human development really is an essential part of any kind of development activity.*

A: The message is that you have to start with where the people are, which is what we did in Oman. We started by finding out what the people thought and what they did. Too often, we would go in with the technology to improve health, but we don't get into whether the people understand what we're doing, whether they have any concept at all even of the nature of disease.

Q: Excellent. So this might apply no matter whether the projects were economic, technology or even a political development projects. You gave the example in Africa of the importance of the tribe, that starting there is essential and that too many of the U.S. programs and maybe the U.N. programs as well, have failed to start with an understanding of those beginning conditions?

A: That's right.

> ***The Society for Research in Adult Development (SRAD) is exploring ways to promote its field. If a foundation of virtually any size could be convinced of the importance of making human development concepts better understood, the evolution of the field could be planned.***
>
> ***-Courtney Nelson***

Q: How do you think the adult developmental psychologists can support the development of effective projects?

A: The best way is by starting with interdisciplinary projects. In other words, the psychological development community ought to be looking for other fields of endeavor where their concepts would make a difference. What I see now is people from other fields of endeavor occasionally tapping into stage theories of the psychologists, but they do it without participation of the psychologists. Bill Torbert is a wonderful example of somebody who has really gotten into the stage theory in his work on management. There are other people who have tried to use stage theory, but not very successfully.

Q: Another person who has been applying ideas of stage development is Don Beck. Examples include his work in South Africa at the time of the ending of Apartheid, more recently his work dealing with the issue of the Muslims in the Netherlands and working with both Palestinians and Israelis in trying to make a shift there. The reports I've heard from the Netherlands, as well as the history of what happened in South Africa, suggest that bringing that developmental psychology perspective—at least in the case of spiral dynamics, the Graves concepts—has been a very important piece in development. What you are saying is that in addition to understanding the economic, technology, political, organizational development things, we have to make sure human development is an integral part of any kind of change program in the third world.

A: That's right. I'm not familiar with what Beck is doing, but it sounds as if he's right on what I would think is the right path.

Q: I hope so because any initiative that can make a positive difference in the Middle East is welcome, right?

A: Yes it is, but that's a tough one. Another example of not understanding human development is Bush's notion that you can introduce Democracy everywhere. That's just stupid because it doesn't take into account how people think.

Q: So there are profound policy implications for the things that you are suggesting.

A: Yes.

Q: *What is your path for trying to communicate this to people who have influence on policy? Do you have any plans in that regard?*

A: I don't have plans. I'm not sure how one would do that. Introducing the concepts of stage change to different fields through research projects seems to be one way, but that's kind of a puny way to go about it. I don't know what the best way would be in other fields. It is so clear that introducing democracy in a place where people are going to vote by their sectarian identity and not on the basis of policies or personalities is just stupid. It's going to lead to the predominant ethnic group running everything.

Q: *Yes, or the predominant religious group as in American politics recently.*

A: Yes, we've taken a long time to get over—we may not be over it yet—but there were a lot of wards where if you weren't Italian, don't bother. The race card is still pretty important.

Q: *There are academic studies and studies that can be done by foundations in development projects and things like that. Is there anything else that we should be doing?*

A: Some work in retrospect is one way to go. You'd look at an intervention for whatever its purpose was and then try to figure out what its human development spin-off was. You might be able to evaluate or to rank projects on the extent they had left the participants and people around them better off in terms of worldview and stage of development. Even though that wasn't their main purpose, often you could figure out ways in which to design the project to achieve the same material objectives and also have a human development payoff.

Q: *Courtney, it's clear you've got just a wealth of experience that you've accumulated in your lifetime. Yours is a very important message on development and policy. I hope this interview will help promote that.*

A: I hope so too. I enjoyed talking with you.

A Process Model of Integral Theory

Bonnitta Roy

Abstract: In this article I introduce a Process Model of integral theory, combining Dzogchen ideas and Western works on process philosophy. I make a distinction between Wilber's notion of perspective and the Dzogchen notion of view. I make the further distinction between Wilber's use of process in his writings from what I consider to be a process view. I distinguish epistemological categories of knowing from ontological ways of understanding and propose ways to integrate the epistemological field with the ontological dimension by contextualizing both the ways they are related, and the characteristics that distinguish them. This article outlines the conditions of structural enfoldment and shows how they can help contextualize the limits of structural frameworks. I introduce how process models of cognition, conceptualization and value can be integrated into the Process Model.

Keywords: Dzogchen, epistemological field, Guenther, integral theory, microgenesis, ontological dimension, perspective, process model, states of consciousness, structural enfoldment, structure-stages, view.

Introduction

In a recent talk on Integral Spirituality in New York City,[1] Ken Wilber highlighted Dzogchen[2] philosophy as one of the world's greatest contemplative systems. He mentioned this at the end of a day focused on talking about the structure-stages he has mapped in his AQAL ("all quadrants, all levels, all lines") framework. Wilber's AQAL model does not contradict Dzogchen thought per se; but, as this article argues, Dzogchen cannot be fitted into its framework. Dzogchen therefore presents a certain challenge to the goal of making the AQAL model a "Theory of Everything." The challenge Dzogchen presents has to do with the notion of *fundamental view*. In *Integral Spirituality* Wilber (2006) writes:

> This **Integral Post-Metaphysics** replaces perceptions with perspectives, and thus redefines the manifest realm as the realm of perspectives, not things nor events nor structures nor processes nor systems nor vasanas nor archetypes nor dharmas, because all of those are perspectives before they are anything else, and cannot be adopted or even stated without first assuming a perspective (p. 58, emphasis in the original).

View is closely related to Wilber's understanding of perspectives, but unlike Wilber's perspectives, *this notion of view* cannot be coded by such things as integral math.[3] We can say, for example, that the *view* through which Wilber's notion of perspectives arises is a *structural view*, since it arises through the structural approach that is the AQAL framework.[4] A structural *view* crosses all perspectival lines; for example, talking about structural levels of consciousness when approaching consciousness as a subject in dialogue (Wilber's example of '*1p x 1-p x 2p*'); or writing about cultural structure stages from a third person point of view (*3p x 3-p x 2p*). Nevertheless, the structural view itself governs what kinds of "things" arise, what kinds of "things" the theory has the capacity to see—beyond which the theory cannot think. Is the structural approach itself a perspective? Or are the perspectives structures? If the former is true, then what kind of perspective *is* a structural approach? How would we do that math? If the latter is true, then perspectives cannot be primary. What is the relationship between the primary perspectives and the approach from which they are derived?[5]

---

[1] Ken Wilber and Traleg Rinpoche in dialogue on September 9, 2006 at the Society for Ethical Culture, New York City—sponsored by EVAM Institute.

[2] The term "Dzogchen" is a shortened version of "rDzogs-chen" pronounced so that the initial 'D' is almost silent, and the 'g' makes a softer, almost 'k' sound, and with emphasis on the second syllable. Dzogchen refers to the philosophy and practice of Tibetan Buddhist lineages originating from Tibetan Bon (pre-Buddhist) traditions.

[3] Wilber introduces the notion of integral math in an appendix to Excerpt C (Appendix B. An Integral Mathematics of Primordial Perspectives) which is available online at http://wilber.shambhala.com/html/books/kosmos/excerptC/appendix-B.cfm

[4] None of this is to suggest that Wilber's thought is static. On the contrary, much of what underlies his AQAL model and his theories of structural relations are the kinds of processes that give rise to them. On the other hand, I am making a strong distinction between starting with such a structural view, and working process terms into it, versus reasoning from a process view. The very term "process" has one meaning from a structural viewpoint, and another meaning from a process viewpoint. I believe that the fundamental basis from which Wilber assigns meaning to the term "process" comes from his quadratic orientation, and the taxonomic (structural) relations that describe them holonically. Further on, the article will discern these as *conditions of structural enfoldment*, hence arising from a structural approach. For an example of how these two views on process compare and contrast, see Appendix C: The Process Model "In Conversation" with Ken Wilber on the Mind-Body Problem.

View refers to something more basic and more nuanced. Newton, Einstein and Bohr argued from a common *perspective: third person, objective*. But Classical Physics, Special Relativity, and Quantum Mechanics each have a different *view* of reality. Likewise, just as a structural approach can cross over into different perspectives, so too can a process approach: there can be process-based dialogue on interior experiences as well as scientific observations (*1p x 1-p x 2p*; *1p x 3-p x 2p)* as well as process-based third-person points of view on interior consciousness, cultural values and the like. Structural approaches and process approaches can cover the same territory, through all the various perspectives, yet a process approach will have a completely different *view of reality*.

At the same event in New York City, Traleg Rinpoche suggested, "be mindful of what is your *view*." One of the goals of this article is to help us be more mindful. To help us understand our *view*. My approach is to present an alternative to the structural view in the form of a process view, so we can be more aware not only of the benefits of a process view, but also of the limitations and constraints of a structural view. I will propose a *process view of integral theory*—not *only* to compare and contrast views, but also with the belief that a process view captures more of the Dzogchen intention of *being mindful of our view*.

Language Issues

This article is an introduction to a Process Model of Integral Theory.[6] It is written from a *view* integrating Dzogchen and Western process thought. Like Guenther, I hope to tease you, the reader, into a pure process orientation. This requires adopting a certain attitude—allowing one's mental framework to release its grip on thinking in terms of things, and following me into a world of process or flow in a field of dynamic forces. It requires you to suspend structurally based perceptions to allow for new ways of orienting perceptions.[7]

The challenge a process view presents is not only in the way our thought tends to be, but also in the way our language tends to limit how we *can* think. The English language is a major obstacle in any presentation of process thought—Dzogchen and otherwise. David Bohm (1980) noted:

---

[5] According to Wilber's model, the *discipline of structuralism* is a zone 2 (3p x …) investigation of reality "which can be approached with methodologies such as developmental structuralism …. cultural anthropology, neostructuralism, archaeology, genealogy" (Excerpt D, p. 1). I am trying to point to something more fundamental than the self-referential loop of "a zone 2 approach deriving itself." I am referring to something else—the view that originally drives the approach that derives the perspectives; to distinguish that view, for example, from the view that would drive one approach over the other, in this case a process approach, to derive the perspectives. This notion of view, and its relationship to perspectives, is treated again and again in this article, in an attempt to clarify the distinction.

[6] I have included two appendices with this article that focus on illustrating specific points about the Process Model and its relation to Wilber's thought. They are intended to address issues relevant to those readers who want to go deeper into matters that are tangential to the main text, but important to gain a more refined understanding of some of the finer distinctions being made. There is also an appendix with extensive quotes from Herbert Guenther that more fully illustrate some of the distinctions related to his understanding and approach to a process view.

[7] See Appendix B: Guenther Notes.

> . . . every language form carries a kind of dominant or prevailing world view, which tends to function in our thinking and in our perception whenever it is used, so that to give a clear expression of a world view contrary to the one implied in the primary structure of a language is usually very difficult (p. 46).

English is primarily a noun-based one that leads almost exclusively to subject-verb-object constructions—constructions which in turn implicitly lead to a world view in which subjects and objects are separate "things" that require conjoining. In verb-based languages, subject and object are wholly implicit in the verb which is itself sufficient to convey meaning.

Reader and writer therefore share this challenge—not only to suspend our usual ways of interpreting text, but to experiment with new ways of writing it.[8] Both reader and writer need to stretch.

Presentation Issues

An introductory article such as this one hopes to stretch and bridge—new territories and familiar ones. The first step will take up the already familiar structure-stages in integral theory, and show how they can be derived from something deeper; namely, the dynamic fields or processes that generate them. The second step will be to show how and where *states*, as opposed to the structures, map onto the Process Model. The third step will be to give a brief preview of how the Process Model can be used as an orienting map to integrate process-based theories of development, in much the same way that Wilber has used his structure-based map to integrate structure-based theories of development. Each Appendix offers material to support deeper understandings in selected areas without interfering with the flow of the main text. This preview involves incorporating Jason Brown's process-based theories of cognition and value into the Process Model.

This article is written from a view that carries many idiosyncratic connotations within the language I use. It may be helpful for readers to go through the entire article once to simply get a picture of the whole view being presented, and then re-read it with this view in mind to better understand how it informs the language being used. Ultimately, I hope to show you that a process approach to thinking about integral theory—a process *view*—can help expand our understanding of consciousness and the nature of reality beyond what is possible within a structural view. It is a way of thinking that creates extraordinary new potential for understanding development and evolution in relation to consciousness, and can be applied in the designing of new types of transformative practices—all of which constitutes the topics of future articles concerning a process approach to integral theory.

---

[8] Experimenting, as Guenther did, with entirely new kinds of language would be a detriment, given the scope an introductory article such as this one. However, Bohm has already done some experimenting with language that might more easily lend itself to a pure process view. Bohm (1980) experimented with a verb based language he called a "rheomode," noting that "in the ordinary mode of language, truth is taken as a noun, which thus stands for something that can be grasped at once and for all or which can at least be approached, step by step" (p. 41). Developing the beginnings of a verb based language allowed him to point to ways in which language could be used to imply and coherently reveal a world view based in the kind of wholeness and process he perceived at the heart of reality.

Process Views

Buddhist/Dzogchen

Buddhist scholastic thought includes an enormous number of structural systems. Generations upon generations of scholars, east and West, have studied them and added to them. As Herbert Guenther (1989) says:

> The earliest Buddhists prided themselves on having reduced the whole of reality to discrete entities and their transitory relations. This made it impossible for them to account for the unity of the human individual and even more impossible to account for the unity of the multifarious programs of his brain/mind. Clearly, there must be something wrong with the initial premises; when they are pursued to their logical conclusions as was done by the Madhyamika thinkers, they are found to be self-destructive. A change in perspective not only was called for but actually took place, ushering in, if not part of, a Zeitgeist that made Buddhism move in a new direction (pp. 23-24).

According to Guenther, Tibetan Dzogchen thinkers made a critical distinction between a reductionistic, self-limiting view, and an open *dynamic* approach. They considered the earlier view as a strictly Indian view that "was structure-oriented and tended toward reduction of reality to a model that could not but rigidify what is better left flexible and alive" (p. 23).[9]

Herbert Guenther is perhaps the only Western philosopher to attempt maintaining the essential Dzogchen view—which is a pure process view—in a Western translation. In order to do this, Guenther had to invent an entirely new language; one that could convey some of the content of Dzogchen ideas on spirituality and reality to the Western mind, without compromising Dzogchen's pure-process view.[10] Guenther combined the deeply intuitive and rigorously hermeneutic language of Heidegger with the mental framework of systems science. Guenther found the language of systems science useful to describe a reality not made of particles, but of deeply dynamic interactions in a field of forces and relations. In Heidegger's work, he saw an opportunity to convey the thoroughly dynamic character of Dzogchen in Western terms in the ways in which Heidegger had endeavored to get beyond the ontic or thing-centered interpretation of reality, to explore a deeper ontological reality.[11] Not surprisingly, Guenther's writing is complex, and despite his extraordinary effort, his work draws a very small audience—although in some circles he is revered for it. This is unfortunate, since his expositions of Dzogchen thought are revelatory.

[11] See Appendix B: Guenther Notes.

Western

Western philosophy also has a rich tradition of processed-based thought. Modern process thought primarily traces back to Alfred North Whitehead's (1978) seminal work *Process and Reality*. Wilber himself has incorporated some of Whitehead's ideas in his notions of prehension,[12] dominant monad,[13] and the like.[14] Across fields of interest, philosophers and researchers—thinkers and tinkerers alike—have benefited from the way Whitehead's process philosophy helps to expand the field of inquiry and thereby deepen our understanding. In this paper, Jason Brown (1991, 1996, 1997, 1998, 2000, 2002, 2005), whose process theories on cognition and value make a significant contribution to the Process Model,[15] can be considered one of the most important new thinkers in the post-Whiteheadian tradition.

Not all process thought stems from Whitehead's work. A process approach can also be seen in works over a wide range of ideas—in Otto Scharmer's (www.ottoscharmer.com) U-Process, Eugene Gendlin's (www.focusing.org) Philosophy of the Implicit, Christopher Alexander's (www.natureoforder.com) Nature of Order, Amy and Arnie Mindell's (www.processwork.org) Process-Oriented Psychology, just to name a few. Recently, Nicholas Rescher (1996) has written excellent primers on the history, characteristics and evolution of process-based thought (see especially *Process Metaphysics*).

On the website for The Center for Process Studies—which hosts current articles exploring the nature of cognition, consciousness and spirituality—process thought is introduced as follows:

> With a foundation in the metaphysical system of Alfred North Whitehead (among others), and a methodology that integrates both speculation and empirical verification, process thought brings its unique metaphysical perspective to bear on many fields of reflection and action. Ultimately, process thought seeks to integrate and reconcile the diverse facets of human experience (i.e., ethical, religious, aesthetic, and scientific intuitions) into one coherent explanatory scheme.
>
> Process metaphysics, in general, seeks to elucidate the developmental nature of reality, emphasizing becoming rather than static existence or being. It also stresses the inter-

---

[12] "But the *interior* of the cell contains no proteins, molecules, or organelles at all—it contains sensations, prehensions, proto-experiences, rudimentary feelings, and so forth (a la Whitehead)." http://wilber.shambhala.com/html/books/kosmos/excerptC/intro-3.cfm

[13] "in one sense, an individual organism is a system, because "system" in general simply means "a functional whole;" but this individual system has a center of prehension, whereas a collective system does not—as Whitehead put it, the individual has a "dominant monad." http://wilber.shambhala.com/html/books/kosmos/excerptC/part2-2.cfm

[14] Wilber's more recent writings not only incorporate much of Whitehead's important ideas, but he has also raised several important issues concerning the limitations of Whitehead's process philosophy, especially with respect to the postmodern concern over the intersubjective component of the subjective. Wilber refers us to the intersubjective structures of the LL quadrant which pre-constitute the actual (occasioning) subject. For a discussion on how the Process Model relates to this issue, see Appendix D: Wilber, Whitehead and the Postmodern Condition.

[15] Since this is only an introduction to a process approach to integral theory, I have named the overall approach "the Process Model," in order to "tag" its essential ideas to that title, and to be able to refer back to those ideas, to refer back to its fundamental *view,* as *the Process Model.*

> relatedness of all entities. Process describes reality as ultimately made up of experiential events rather than enduring inert substances. The particular character of every event, and consequently the world, is the result of a selective process where the relevant past is creatively brought together to become that new event. Reality is conceived as a process of creative advance in which many past events are integrated in the events of the present, and in turn are taken up by future events. The universe proceeds as "the many become one, and are increased by one" in a sequence of integrations at every level and moment of existence. Process thought thus replaces the traditional Western "substance metaphysic" with an "event metaphysic" (Center for Process Studies, 2006).

From this description, we can see that process thought is in many ways *inherently integral*, in that it "seeks to integrate and reconcile the diverse facets of human experience into one coherent explanatory scheme;" and in that "it also stresses the inter-relatedness of all entities." From a process point-of-view, substantialist "things" are not only defined by their discreteness, but it is precisely their capacity *to be delimited*, that keeps them as separate—*separated entities*. In the words of Nicholas Rescher (1996):

> An adequate substance metaphysics cannot make do without processes. And at this point one is well en route to joining the process philosopher by acknowledging that the integrity of *things* consists in a unity of *process*—that things are being integrated and consolidated as such by acting in a unitary way in relation to others. Unity is as unity does: The unity of things is a unity of process (p. 57).

Wilber's structural approach to integral theory may not stem from a pure process view, but neither is it a *substantialist theory.* Early on in his writings, Wilber (2000a) makes this very clear: "Likewise, reality might be composed of processes, and not things, but all processes are only processes within other processes—that is, they are first and foremost holons" (p. 42). He underscores this in the first of his twenty tenets governing holons: "*Reality as a whole is not composed of things or processes, but of holons"* (p. 43).

It also seems to be the case that as one begins to work in a more sophisticated way with Wilber's AQAL matrix, there is a natural progression[16]—one aspect of which is moving from a static interpretation of the structures and categories in the model, to a more fluid and dynamic orientation which probes for the underlying processes constituting the basis of the structural interpretation. As Wilber's own ideas evolved, he began to emphasize the primacy of perspectives over holons, as in the quote cited above. Our concern here is not whether or not perspectives are "things" or "processes"—that is merely a reductive argument. Our interest is to identify the overall *basis or view*, the structural territory his map of perspectives is being drawn from, and then to distinguish this from new territory—the territory disclosed through a process based *view*.

---

[16] Keith Bellamy describes an "Integral Awareness Developmental Line" that outlines the progression of understanding and utilization of integral theory. He describes phases of; emergence, associating, proselytizing, discerning, and benefiting, ending in a trans-rational relationship with integral theory. (Bellamy, 2006).

Structures and States

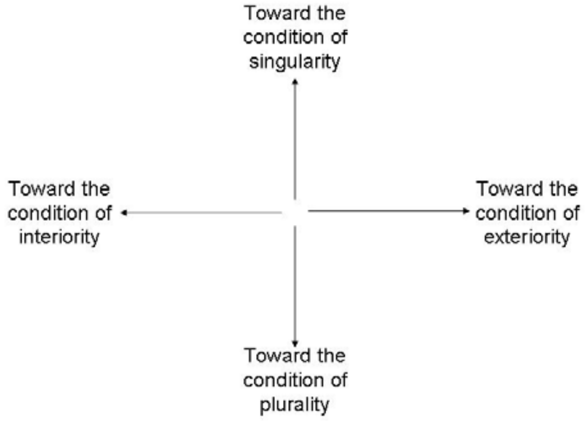
Structures in the Epistemological Field

Interior Single	Exterior Single
Interior Plural	Exterior Plural

Figure 1. The Four Quadrants

The basis of all of Wilber's recent work is the 4-Quadrant model. In its simplest form it conveys 4 domains: the interior-single, the exterior-single, the interior-plural, the exterior-plural. It is easy to see that the model is a matrix created across two primary conditions: (1) the condition of being interior or exterior; and (2) the condition of being singular or plural. Thus, as we can see from Figure 1, what contrasts both left-hand quadrants from both right-hand ones, is the condition of being interior or exterior; and what contrasts both upper quadrants from both lower ones, is the condition of being singular or plural.

If we relax the box-like structure and reframe the axes from static, either-or language to more process oriented language, it opens toward a more dynamic representation. From this, we come up with the illustration in Figure 2, in which the arrows depict a kind of tendency, drive, pull, or *movement in the direction of those certain conditions.*



Toward the condition of singularity
Toward the condition of interiority
Toward the condition of exteriority
Toward the condition of plurality

Figure 2. Process View

Figure 2 already suggests that there is something deeper underneath the structural quadrant perspective. It shows that each quadrant is a kind of structure[17] composed of at least *two* tendencies—a tendency toward being interior (or exterior) *and* a tendency toward being singular (or plural).

A process view takes just this kind of approach. Where a structural view "sees," or directs our attention and perception to notice discrete quadrants, a process view "sees" complex relations in a dynamic field. Figure 3 illustrates the field that generates the quadrants. It suggests that there are forces (labeled "interior," "exterior," "one," "many") operating in a field to create an interplay of relations. We

---

[17] Of quadrants and structures, Wilber says (in Excerpt D): a structure is a " *holistic, dynamic pattern of self-organizing processes* that maintain themselves as stable configurations through their ongoing reproduction" (p. 2); and quadrants are prior to and somehow occupied by them ("structure" is commonly used in a very broad sense to mean any form, pattern, or agency in any of the quadrants—interior or exterior, individual). The process shows that the quadrants are generated through a dynamic process, and therefore, to the extent that they are considered stable configurations, they can be considered as primary structures.

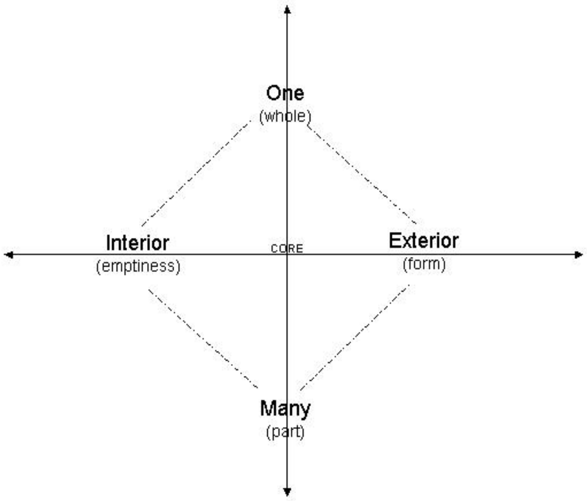


Figure 3. The Epistemological Field

will see that this interplay of relations generates self-world-other—what is known about reality—and therefore it is called the Epistemological Field.

In process language, Figure 3 is described as having two intersecting axes which can be thought of as the two primary valences. Each valence is comprised of a pair of vectors (or forces) acting in opposite directions. The horizontal valence is comprised of the vector pair interior/exterior. The vertical valence is comprised of the vector pair one/many. The vector pairs are considered to be complementary forces, in the sense that they are apparently opposite, but are coupled in such a way that they, in fact, mutually define. Complementary vectors are related in a characteristic way – the more you have of one, the less you have of the other. In the empirical domain, we run into complementarity with such matters like the wave-particle duality, and the relativistic equations between energy and matter. It can be seen that the characteristic of complementarity underlies all dualistic thought. David Loy (1997) writes: [Dualistic thought is] “thinking which differentiates that-which-is-thought-about into two opposed categories: being and nonbeing, success and failure, life and death, enlightenment and delusion, and so on” (p. 18).

The Process Model suggests that *everything* that arises through the dynamic interplay of complementary forces—everything that is generated in this dynamic field, being composed of dualistic categories, has this dualistic nature. This is a critical condition for the kinds of structures that arise there. We tend to interpret these structures—and their taxonomic organization—as somehow precisely delimited; that, for example, once a level in a structure-stage emerges, the lower levels are transcended and included in such a way that the lower can be seen by the higher *in a transparent way.* According to Wilber, this transparent seeing happens because the subject of the prior level becomes the object of the subject of the next level. The Process Model says something different. The Process Model says that since the structure-stages arise in a field of complementary valences, they are *inherently dualistic* and therefore, relations between them are also complementary and self-define—in other words, the relations which delimit the structures, relations such as lower and higher, before and after, whole and part, subject and object—are dualistic.[18]

---

[18] The Eastern notion of reality pervaded by dualistic thought closely parallels process thought on the nature of structural relations. Process philosophy considers that any given set of structures that are related, must be internal to a process that generates them (generative process). From a process point of view then, only the generative process exists at a higher order, namely, the generative order which undergoes changes of dynamic natures—changes in forces such as rate—as opposed to differences in static “properties.” Relations between structural properties in turn, are considered to be more like “Cambridge Properties”—a term coined for relations that are not real changes but rather are properties of an event only from a certain *perspective*, such as change in relative motion, all of which depend upon a situated frame of reference. While we are used to identifying perspectival conditions across the quadrants, the

The problem with dualistic thinking, Loy (1997) goes on to say, is that

> although distinctions are usually made in order to choose one or the other, we cannot take one without the other since they are interdependent; in affirming one half of the duality we maintain the other as well. . . . What kind of thinking remains? If all language seems to dualize, in distinguishing subject from predicate/attribute, how can there be such a thing as nondual, or nonconceptual, thinking? Can we get along without dualistic categories? And even if we can, is it desirable? The nature of any alternative—or is it no thinking whatsoever?—needs to be explained, and its feasibility defended (pp. 18-21).

If there is non-dualistic, non-conceptual thinking then it must arise through another kind of process—and the Process Model reveals an entirely new dimension, which will be introduced later in the article. After doing this, I will introduce a new understanding of cognition, which can address the question of the desirability of thought itself. For if we can *understand the process that is "thought,"* then we can better engage its usefulness. *If we can understand the process that is "mind,"* then we can be more *"mindful."*

In summary, the Process Model suggests that conventionally structured experience—including the experience of thinking—is constituted by these fundamental valences, with their four complementary vectors (forces, aspects). The dynamic field in which all this takes place—represented by those fundamental valences, is considered to be the Epistemological Field, because it generates the ways in which we know reality.

I have deliberately chosen the vector labels to be as simple as possible—with as little metaphysical baggage as possible, as it were. However, since they are relevant to some very important metaphysical discussions on spirituality, I have also added the labels emptiness/form and whole/part which correlate to them.[19]

Figure 4 illustrates how the 4-quadrant domains can be seen to arise through a dynamic interplay among neighboring aspects: the interplay between the force, drive, tendency towards, or aspects of interior and one ("interior x one") generates the UL or subjective quadrant; the interplay "one x exterior" generates the UR or objective quadrant; and likewise, "exterior x many" generates the inter-objective quadrant; and "many x interior" the inter-subjective quadrant.

---

process model pushes further, and identifies perspectival conditions within the structure-stage lines that occupy the same quadrant.

[19] It is relatively well known that there is a deep spiritual awakening that takes the form of realizing not only *that*, but also *just how* "form is emptiness, and emptiness is none other than form"—a realization that can be described in the process model as *collapsing* the movement along the interior-exterior valence, or, in the words of Mipham, a 16th century Dzogchen author of *The Beacon of Certainty*, *coalescence* of the aspects of interiority and exteriority. The non-dual stage after coalescence can then be described as achieving equanimity of opposites, or return to a fully open dynamic field. There is a similar, but less known phenomenon, with respect to the one-many valence—a phenomenon which on the one hand creates a holarchic (or whole-part) apperception of reality, which gives way to the collapsing or coalescence of the whole-part relations—a theme taken up early on by Plotinus, and in modern times by, among others, David Bohm.

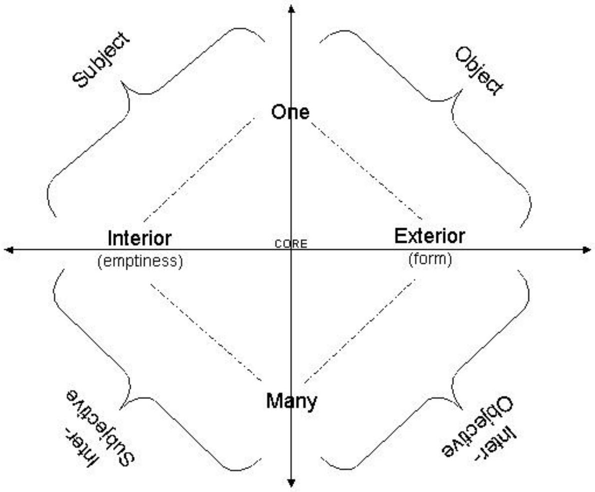

Figure 4. Four Quadrant Domains

Since they are shown to be derived from such a process, the Process Model considers the quadrants to be *structures.* We can also say the quadrants are *primary* structures, since they are derived from simple operations—merely combining two aspects. In other words, we can say that these kind of simple operations are "first-order dynamics." (It will be shown later in the article how more complex structures arise from 2nd, 3rd… nth-order dynamics). We can also add primary operations to primary structures in various ways. For example, when each of the quadrant-structures undergoes a second iteration along the interior-exterior valence, Wilber's 8 indigenous perspectives are generated, namely, the insides and outsides each of the four domains (as he describes online in Excerpt D: The Look of A Feeling[20]). Similarly, Wilber's holarchic organization, or the whole-part relations that prescribe all the various lines in each of the domains, is a second iteration along the whole-part valence. Looked at from this view, the Process Model helps explain the deep coherency in Wilber's model—both the 8 indigenous perspectives and their holarchic organization arise within a single iteration in the dynamic field.

By applying this process of moving through the fields in successive iterations, it can be shown how more complex structures like self-world-other and values/beliefs result from the interplay of these higher-order dynamics. Wilber maps these more complex structures in developmental lines as structure-stages, according to his holarchic understanding of development. The Process Model can show how *all of the structure-stages* are generated by process dynamics operating in this field of valences. A pure process view reaches even further: it has the capacity to integrate, in new ways, models of development that are not limited to structure-stage taxonomies, but arise from a process-oriented approach, such as Jason Brown's theories of Cognitive Microgenesis and his Process Theory of Value, which we will take a brief look at later in this article. In turn, the Process Model reveals new understanding of the very *nature* of development and evolution when these process-based theories are mapped as a coherent whole in the Process Model (in ways similar to how Wilber has organized structural models in his structural AQAL framework).

States in the Ontological Dimension

The previous discussion described the field of valences that generates all the structure-stages. Because here is where the Process Model describes how reality is *known*, we refer to it as the Epistemological Field. But what of the *states* of consciousness—where do they fit? In *Integral Spirituality* (2006, p. 96) Wilber identifies five primary states of consciousness:

---

[20] http://wilber.shambhala.com/html/books/kosmos/excerptD/part1.cfm/

1. gross-waking states, such as what I might experience riding a bike or reading this page; or doing bodywork;
2. subtle-dream states, such as I might experience in a vivid dream, or in a vivid “daydream;” or visualization exercise, as well as in certain types of meditation with form;
3. causal-formless states, such as deep dreamless sleep and types of formless meditation; and experiences of vast openness or emptiness;
4. witnessing states—or “the Witness”—which is a capacity to witness all of the other states; for example, the capacity for unbroken attention in the waking state and the capacity to lucid dream;
5. ever-present Nondual awareness, which is not so much a state as the ever-present ground of all states (and can be “experienced” as such).

He goes on (p. 98) to make the following distinctions between *structure-stages* and *state-stages:*

1. States by their very nature are much more amorphous and fluid than structures, this stage sequencing of states is very fluid and flowing, while *structure-stages* are fairly discrete levels or rungs in development.
2. You can peak experience higher states, but as research shows time and time again, *you cannot skip structure-stages, nor can you peak experience higher structure-stages*.

The relationship between the structure-stages and the state-stages lends it self to some fine-tuning in Wilber’s model. In his earlier writings, the state-stages were conceived as being part of a continuum related to the cognitive line in the UL quadrant. However, the notion of accessibility to states, i.e., that all people everywhere, regardless of their structure-stage of development, have access to all the *states of consciousness,* became problematic.[21] The resolution of this problem is understood to be the following:

> The point is that a person can have a profound peak, religious, spiritual, or meditative experience of, say, a subtle light or causal emptiness, but they will interpret that experience with the only equipment they have, namely, the tools of the stage of development they are at (Wilber, 2006, p. 112).

And its representation became known as the Wilber-Combs lattice, (Wilber 2006, p. 90.) in which the state-stages at the top are loosely correlated with the state-stages running in various lines below them. Looking at the Wilber-Combs lattice, we see that the structures that arise in the epistemological field constitute the lower half. What if we imagined an entirely new process plane—and entirely new dimension where the state-structures arise? What kind of dimension would this be? Contrasting the Epistemological Field where structure-stages arise and reality is *known*, the Process Model posits what it calls the Ontological Dimension, where *states of being arise* and “suchness is.”

---

[21] Of his earlier work, Wilber (2006) notes, “we early researchers tended to confuse higher states with higher structures, and then stack the higher states on top of the conventional structures. I did so in Up from Eden, where the structures are called “average mode” and the states are called “most advanced mode” (p. 284).

To represent the Ontological Dimension, we add an ontological valence labeled “anterior” and “posterior” as a third axis parallel to the two axis of the Epistemological Field. We can see from Figure 5, that this third axis prescribes a three-dimensional diagram—the two dimensions of the epistemological plane, and the third dimension which is imagined as the plane running directly out the back of the page in the anterior direction, and straight out up from the page in the posterior direction. The Process Model represents the state-stages along the anterior-posterior valence as described in Figure 6. (Figures 5 and 6 can be found in Appendix A: Figures).

Like the Wilber-Combs lattice, the Process Model recognizes that the states of consciousness are of a different sort than the stage-structures of consciousness. But whereas in the Wilber-Combs lattice they are represented as loosely affiliated, through the notion of stages, in the Process Model, the Ontological Dimension is *significantly exceptional from and operates under completely different rules of process than those in the Epistemological Field.* The Process Model suggests that these processual differences *are the significant differences that distinguish the structure-stages from the state-stages.*

The first and foremost difference is that unlike the Epistemological Field, where the forces are complementary, the anterior and posterior vectors of the Ontological Dimension are *entangled*. I use the term “entangled” to convey the characteristics of temporal simultaneity and spatial non-locality; but also to contrast it with the dualistic, trade-off characteristics of complementarity. Entanglement entails omni-directionality, coherence (unity) of event histories and the like. As discussed later in the section on The Conditions of Structural Enfoldment, the Process Model shows how movement in a field of complementary forces (in the Epistemological Field) creates both a spatial and temporal dimension, and with it an arrow of time (event history). In other words, the relations among complementary forces in the Epistemological Field create a local point of view, situated in a sense of “here and now.”

The ontological dimension provides no such spatial or temporal benchmark. The anterior is related to the posterior not as a “before” and an “after,” but as a single simultaneity; a resonant and coherent temporal unity. For example, when I experienced learning algebra as a specific event in time, there was a clear sense of “before I knew algebra” and “after I knew algebra.” This kind of event occurs in the Epistemological Field and correlates to the structure-stages having specific temporal conditions, namely that “*structure-stages* are fairly discrete levels or rungs in development” and “*you cannot skip structure-stages, nor can you peak experience higher structure-stages*” (Wilber, 2006, p. 98).

On the other hand, a peak (peek) experience of a higher *state* of consciousness is an Ontological event—when I have a glimpse of the subtle ground of reality, I experience it both as having come to that realization *in time but also as having re-remembered it as always already having been.*[22] The Ontological now is *significantly different than* the epistemological here-and-now; there is a kind of collapse in the feeling, or apperception of time in the ontological now.

---

[22] Heidegger emphasized in many different ways the recollective or remembering that accounts for the ontological difference, as David Michael Levin points out: “So we see that the Lighting of Being gives way to … [a] ‘recollection’ of that more primordial decision, the ontological difference. In such ‘recollection,’ we go down into ourselves—this is the phase of *Erinnerung*—and we attempt to retrieve, on this journey of return, that which has been forgotten. This retrieval is a W*ederholung,* a process of healing integration, of re-membering … (Levin, 1988, p. 386). And of its atemporality, Levin goes on to write: “The past is not simply past, the future not simply future; and the present, therefore, ‘is not shut up within itself but transcends itself towards a future and a past. … Understanding the sense in which the past and future are gathered into their presence, the seer, holding herself open, may accordingly say that

Wilber's finest spiritual writing eloquently captures both the feeling of the "always already" and the ontological "now-ness," as when he writes:

> It is always already undone, you see, and always already over. In the simple feeling of Being, worlds are born and die—they live and dance and sing a while and melt back into oblivion, and nothing ever really happens here in the world of One Taste. … And I-I will be there, as I-I always have been, to Witness the rise and miraculous fall of my infinite easy Worlds, happening now and forever, now and forever, now and always forever, it seems (2000b, p. 623).
>
> … in that unitary seamless sizzling Now, which is this very moment before you do anything at all, it is, quite simply, over. Which means, it has, quite simply, begun (2006, p. 346).[23]

Therefore, as Figure 6 (in Appendix A) shows, a gross state of consciousness "sees" only gross subjects and objects (the posterior view) as arising from other gross level causes (the anterior view), but a subtle level of consciousness "sees" gross *and* subtle level subjects and objects arising from subtle level causes (and so forth for the higher states, not illustrated). In other words, there is a kind of entangled relation that is disclosed between the gross and subtle levels. An ontological experience doesn't see levels stacked up uni-directionally in time. The relations in its generative processes are two-directional. The states are experienced as both *higher and more fundamental—they stack up in both directions at the same time.*

The second difference is that reasoning from the Epistemological Field is inherently dualistic, indeterminate, and unsolvable; it is a kind of reasoning that creates infinite complexity. This accounts for the quintessential characteristic of that field, which is unlimited movement. "Which came first, the chicken or the egg?" is an impossible question. *Questions are not solved* in the ontological dimension—they simply don't arise there. In the ontological dimension it is *clearly seen* that/how the chicken and the egg arise. This "clearly seeing" is not given as a reasoned account of things, it is apperceived in a "feeling of Being-such."[24] This is a simple analogy, but many of our deepest spiritual questions, questions of involution and evolution, the nature of

---

she has 'already seen' what is to come" (p. 459). Note also in this sentence, the "open aspect" of the ontological difference—discussed in the following section.

[23] "The presence of what is present is not finally and also something we *face*, rather *it comes before. Prior to all else it stands before us,* only we do not see it because we stand within it. *It is what really comes before us"* (Heidegger, 1968, p. 44).

[24] The distinctions we are making in the Process Model, between reasoning from the epistemological field and understanding Being-as-such in the Ontological Dimension—a distinction between perception and conceptualization of reality on the one hand, and apperception of reality on the other—closely parallels the Buddhist distinction between *vijnana* and *prajna.* Loy (1988) quotes D. T. Suzuki's paper on *Reason and Intuition in Buddhist Philosophy* to help distinguish between the more conventional way of knowing, vijnana, and prajna, that which goes beyond vijnana:

> Prajna goes beyond vijnana. We make use of vijnana in our world of the senses and intellect, which is characterized by dualism in the sense that there is one who sees and there is the other that is seen—the two standing in opposition. In prajna this differentiation does not take place: what is seen and the one who sees are identical [author's note: or alternately, entangled]; the seer is the seen and the seen is the seer (p. 34).

unbounded wholeness, the infinite regressions of the self, and the like, come to us in a similar fashion.

It is very difficult to capture these kinds of ontological relations from a structural view. A process view is more helpful in understanding the nuances of the Ontological Dimension. Take for example, the chicken-and-egg paradox. A structural view can only say that process P generates products (structures) A,B,C; and even if P and A are related in a holarchic way, their whole-part relations are uni-directional. I will show in the conclusion just how a pure process view can legitimately say that P generates A, *and* A actualizes P.

The Relationship between the Ontological Dimension and the Epistemological Field

According to Guenther, the process-dynamics that the Yogacara thinkers used to derive a system of mind/mentation revealed an interplay of human psychospirituality, in terms of two “movements”—one that corresponds to the processes in what we have been referring to as the Epistemological Field, and another that correlates with the ontological dimension. The first movement pertains to conventional ways of thinking; the second, ontological movement is not a kind of thinking, not a movement of mind, but a kind of *ontological encounter—a transformational, not informational, experience.*[25]

In this section of this article I discuss the relationship between the Epistemological Field and Ontological Dimension in more detail. This will help give you a context for the discussions that follow. There are some easy tests to see whether one is reasoning in an epistemological framework or understanding from an ontological view. For those of you who like to read philosophy, you can use the three questions below to test for “epistemological reductions”—i.e., those ways in which philosophers confuse ontological categories by reducing them into (reasoning from within) an epistemological framework. If answers to any of these questions are “true,” then we are reasoning in an epistemological framework (or from an epistemological view).

These tests are as follows:

1. Are the concepts (or perspectives) delimited by an implicit or explicit one/many divide, or, in other words, are they related as wholes and parts?
2. Are the concepts (or perspectives) delimited by an implicit or explicit interior/exterior relation, or, in other words, are they related as subjects and objects?[26]
3. Is there an implicit arrow of time (or fixed starting point) in a narrative perspective?

We can use these tests as guides to thinking about the relationship between the Ontological Dimension and the Epistemological Field. Since the Ontological Dimension cannot be reduced to the Epistemological Field, they must not be considered as being related in any of the above three ways. From this set of questions or tests, we can further distinguish three points that describe how they are not related, and in this manner of elimination, begin to approach how they are related.

---

[25] See Appendix B: Guenther Notes.

[26] There is a huge amount of literature exploring just this one relationship, and it reaches a much broader range than even the enormous amount of writing, both East and West, on the subject-object/mind-body “problem,” when one considers the theoretical work being done on the “problem” of observation and perspectives itself in physical science, mathematics, and AI; for a good primer, see Atmanspacher & Dalenoort (1994).

1. The ontological does not contain the epistemological, nor vice-versa; neither should it be imagined that the epistemological somehow arises from the ontological, or vice-versa. Neither can be seen as a greater whole or lesser part in relation to the other.
2. It is a common mistake to construe the ontological as being an interior state, relative to the epistemological, but the relations of interiority-exteriority are strictly epistemological relations.[27]
3. An ontological understanding cannot be elucidated in a narrative form that benchmarks or fixes a starting point. As I will discuss in more detail below, it is this kind of benchmarking that creates an arrow of time. Without an arrow of time in the ontological dimension, we experience reality as being simultaneously in this moment, and always already. An experience of ontological discovery comes simultaneously with an experience of re-remembrance. In addition, it cannot be the case that the ontological comes before (in time), nor after, the epistemological.

We experience the movement in the epistemological field as "mind." There is a Zen story that captures this:

> A monk and three students were walking past a school, where a flag was flying in the wind. The monk asked the students "what do you see?" The first student said "the flag is moving." The second student said "the wind is moving." The third student said, "the mind is moving."

Relative to the experience of "moving mind," the ontological dimension, by contrast, has the feeling/aspect of stillness. However, this "stillness" is not to be construed dualistically (that would be an epistemological reduction); rather, it is a dynamic stillness—like the axel of a cart wheel rolling down a hill. Both the axel and the wheel are moving down the hill together, at the same rate; but relative to the axel, the wheel's surface tread seems to be moving more; the latter due to its relative motions (revolutions) with respect to the "non-moving" axel. The non-dual apperception of movement and the Intellect is a familiar thread in *Mahamudra* text, as Loy (1997) quotes:

> One cometh to know that neither the "Moving" other than the "Non-Moving: nor the "Non-Moving" other than the "Moving" ….

---

[27] This distinction is critical to understanding the non-conceptual, non-dual apperception of reality. Without this understanding, one merely keeps chasing apparently deeper and deeper levels of interiority; associated with the capacity to build an infinite series of apparent interior-exterior boundaries in the epistemological field, resulting in the infinite regression of self or source, one distal, and one proximate. The Process Model can help design transformative practices by readily pointing out that the capacities that are useful ways of *knowing about* are different from the paths of *discovering or realizing being-as-suchness.* The Process Model can point us in the direction appropriate to where we want to be going, at any given moment.

> If the real nature of the "Moving" and the "Non-Moving" be not discovered by these analyses, one is to observe: —
> Whether the Intellect, which is looking on, is other than the "Moving" and the "Non-Moving;"
> Or whether it is the very self of the "Moving" and the "Non-Moving" (p. 137).

As this text illustrates, nondual thinking is paradoxically both active and passive. This again, is characteristic of ontological understanding. There is a both/and aspect to the ontological dimension, rather than an either/or, if-more-of-the-one-than-less-of-the-other aspect that conditions epistemological reasoning. From an ontological view (vs. an epistemological perspective) there is the stillness that generates the movement, as the axel supports the wheel, *and* there is the movement that actualizes the stillness, as the wheel contextualizes their *relative movement.* Epistemological reasoning frames this in terms of which comes first, movement or stillness? or which is the greater whole? or imagines a stillness that is interior to an exterior kind of movement. In ontological understanding, as Mahamudra claims, "there is movement of nondual thought, but at the same time there is an awareness of no movement" (Loy, 1997. p. 143).

In addition, nondual thinking is, relative to the dualistic arisings in the Epistemological Field, effortless. Returning to our axel and wheel metaphor, it is as if we configured the axle/wheel to drive another contraption, producing "work." Similarly, conventionally dualistic thought—the incessant mentalese of "monkey mind"—is like taking the free-wheeling state of movement/nonmovement, and attaching it to certain "gears" and getting locked into conditioned perspectives. The stillness in the ontological dimension is therefore seen to be in concert with the movement in the epistemological field—it is only when the movement of the mind is free and liberated that it simultaneously achieves ontological stillness.

> What distinguishes this free and liberated movement "is the utter freedom of the mind to dance freely from one … thing to another, from one set of concepts to a different and perhaps contradictory set. The difference is not necessarily in the concepts themselves—they may be the same—but how effortlessly the mind is able to play with them without getting stuck (Loy, 1988, p. 148).

The notion of getting stuck is applicable to the understanding of peak experiences, versus a deeper understanding of the nondual. Nondual, effortless movement implies free wheeling in the dynamic field of complementary valences, without benchmarking any vector complement, or becoming embedded in any conditioned perspective. Peak experiences, however, are extreme experiences of getting stuck entirely, at one of the extreme ranges of the Epistemological Field. For example, if I get "stuck" at the far interior pole—I can have a peak experience of radical formlessness. If I get "stuck" at the far pole of "one"-ness—I might have a profound Unity experience; or if I get "stuck" at the far exterior pole, I can experience nature mysticism. Peak experiences can be profound and deeply meaningful experiences. They can help disclose the nature of mind, how it moves through complementary poles. However, they are essentially exclusionary experiences—and therefore it is a serious error to interpret them as "the ultimate canister" of reality. For example, for so many of us in the West who are conventionally embedded in a perspective of separate selves, a peak experience of Unity Consciousness is profoundly spiritual—but for someone like Jonathan Livingston Seagull, conventionally embedded in a group morphic field, a peak experience of distinct "I am-ness" can be an equally profound experience. Likewise, for so many of us in the West who are conventionally embedded in a perspective of a "solid world-out-there" an experience of radical formlessness is profoundly spiritual—but for someone brought up in a Buddhist monastery, absorbed into radical formlessness since childhood, the living, throbbing manifest world of sensuality may be experienced as profoundly and ecstatically spiritual.[28]

This difference—the status of altered states—"is the crux of the debate between conventional and transpersonal psychology" (Wade, 1996, p. 191). The Process Model is in agreement with Wade's position in the debate. The power of "altered states," i.e., epistemic peak experiences, is in their ability to point to how the mind works, by interrupting one's habituated, therefore hidden, epistemic thought processes. What we can *correctly learn* from experiences of this sort is the way that reality is constructed through such an epistemic process. What is most commonly interpreted to be the case—incorrectly—is that such epistemic experiences disclose some ultimate, if otherworldly, reality.[29]

The atemporal nature of the Ontological Dimension is responsible for the characteristics of the ontological now-ness, the feeling of always already, and by extension, the identity of movement and non-movement. The ontological also has an a-spatial character, which is experienced as an open dimension.[30] The Process Model warns us that this "openness" is not the same as what we can imagine conceptually as emptiness or radical interiority (subject permanence).[31] This openness, rather, is also something experienced as a dynamic *opening-up-to* what is absent, what is be-coming—a kind of clearing that allows the presencing of Being. Heidegger borrowed a Greek term *aletheia* to describe the kind of ontological truth that is disclosed by an *opening-up-to*:

---

[28] There is a great movie that deals with just this situation, *Samsara* directed by Nalin Pan

[29] Wade (1996) writes:

> Plasticity of space and time, the loss of self-boundaries, hallucinations—especially unusual percepts such as light, ineffability, and sensations of infinite energy—are subjectively experienced as a non-Newtonian reality, such as another dimension or spiritual realm.... Sensitives, psychics, athlestes, religious ecstatics, recreational drug-users, survivors of near-death experiences, and many "ordinary" people typically experience altered states—if not by accident, most often for egoic reasons unrepresentative of this [Transcendent] stage. They may never progress through the discipline and noetic development beyond strong imagery and bodily sensations to realize that reality is constructed. Hence, they experience a convincingly real "other" world—and their numbers are legion compared to the small proportion of people operating at the high end of Transcendent consciousness (p. 191).

[30] Guenther (1984) points out the corollary relationship between Being's atemporality and open capacity, in characteristically obtuse ways, among them by describing "Being's dynamic character" as "exhibiting [the] atemporally abiding aspect of … Being's essentially open (that is, nonreductive) character, termed utter openness (stong-pa)" (p. 8).

[31] The Process Model maps out why this is the case, since it shows that emptiness *as* interiority is part of the complementary valences in the epistemological field. The actual exegesis of the relationship between openness, or open awareness in the ontological dimension and the notion of emptiness, is well beyond the scope of this article. Suffice it to say that the Process Model is aligned with the Dzogchen Bon texts in which open awareness is contrasted to both sunyata (emptiness) and the permanent subject that realizes it; for example:

> The tradition of *Authenticity* does not consider phenomena empty because they are unfindable; it sees all appearances as empty because they are one in essence (ngo bo gcig) with mindnature (sems nyid). This is pivotal to understanding Dzogchen's view of the authentic. Neither the merely empty nor the wisdom realizing it can be authentic in the way that, finally, our text will propose that reflexive open awareness is authentic. (Klein & Tenzin Rinpoche, 2006).

> Heidegger [redefines] aletheia: no longer understood as truth, it is now that opening which first grants the possibility of truth. ... Metaphysics asks about this Being (i.e. the ground) of beings, but "does not ask about Being as Being, that is … how there can be presence as such. There is presence only when opening is dominant. To "think this opening" is the future task for thought (Loy, 1988, p. 173).[32]

Finally, according to Guenther (1984), Dzogchen contrasts the two great realms (the Epistemological Field and the Ontological Dimension) in energetic terms. The movement in the epistemological field is imagined to dissipate the extremely high energies that are in a sense "stored" in the open and boundless ontological dimension. Therefore, training the mind to be still builds up greater and greater energies (or higher and higher energetic frequencies) which are required to create stable meditative states. According to Guenther, the two realms are coupled in a very interesting way: although the energy from the ontological is dissipated by the epistemological movement, it cannot be exhausted by the epistemological; rather, all the complexity that thereby arises in the epistemological field from that movement*, actually fuels or recharges the energies in the ontological dimension.*[33]

Well, that is a good story to think on. Let's now investigate some of those complexities that arise in the epistemological field.

The Conditions of Structural Enfoldment

The section, Structures in the Epistemological Field, discussed how primary structures arise in the Epistemological Field through simple operations between vector(aspects). In this section I will show how more complex structures can be seen to arise through 2nd order and 3rd order (and by extension on to… nth order) iterations.[34] In Figure 7 (see Appendix A: Figures) I have drawn

---

Just how far the Process Model can take us with regards to highly complex and esoteric themes as those taken up by the best Dzogchen texts, is a challenge for future process thought.

[32] In *End of Philosophy,* Heidegger (1973) writes of this openness in terms of light and its clearing:

> Light can stream into the clearing, into its openness, and let brightness play with darkness in it. But light never first creates openness. Rather, light presupposes openness.
>
> In the Greek language, one is not speaking about the action of seeing, … but about that which gleams and radiates. But it can radiate only if openness has already been granted. The beam of light does not first create the opening, openness, it only traverses it.
>
> We have already reflected upon the fact that the path of thinking … needs the opening. But in that opening rests possible radiance, that is, the possible presencing of presence itself (pp. 384-387).

[33] See Appendix B: Guenther Notes.

[34] "Iterations" simply means one complete revolution through the process field. It is important to note that such a revolution requires a directional component (imagined as either clockwise or counterclockwise

these higher order structures as layers of something like a conch shell growing in a clockwise spiral direction in the epistemological plane. If we imagine the layers growing in both breadth along the interior-exterior valence *and* depth along the one-many valence, we can imagine a conch shell-like structure that grows both wider across the page and thicker as it expands up from the page. The operations that drive the expansion(breadth) in the page-plane represent oscillations along the interior-exterior valence; and operations that drive the thickening(depth) up from the page-plane represent oscillations along the one-many valence.[35] In this way the Process Model gives a dynamic representation of how structure-stages arise—oscillations along the interior-exterior valence(increase in breadth) represent Wilber's phase dynamics wherein "the subject of the prior stage becomes the object of the subject of the later stage;" and the oscillations along the one-many valence(increase in depth) represents the holarchic (whole-part) relations of the structure-stages.

We are now ready to identify the process under which structural enfoldment occurs, namely, (1) through a directional process of iterations (2) within a field of complementary valences (3) deriving interior-exterior and whole-part relations. In Excerpt D, Wilber writes "any integral metatheory might best be guided by three heuristic principles: nonexclusion, enactment, enfoldment" (p. 1). Of enfoldment in particular, Wilber says in Excerpt B:

> Each moment unfolds a new and creative expanse that enfolds and embraces its predecessors… . The prehensive process of unfoldment/enfoldment in any stream could also be called the "natural growth principle" in any stream, and I very much agree with Whitehead that without both an unfolding-creative novelty and an enfolding-loving embrace, it is just damned difficult to account for moment-to-moment existence in any domain at all.[36]

In Figure 7, structural enfoldment is represented by movement in the clockwise direction; and so unfoldment is represented by counter-clockwise movement. Unlike Wilber, however, the

---

movement in the field); and that this directional component constrains the kinds of structures that arise. I would also like to make a point of some terminology distinctions that relate to the discussions that follow. Primary structures result from combinations that happen in the field of valences without re-iterative cycles. Quadrant-structures arise from interplay of neighboring aspects without iteration—there is no axis or direction of revolution. An iterative process may be composed of any number of operations through a single revolution, depending on how finely one slices the pie. Theoretically, there are an infinite number of gradations that can be described through any process, from "start to finish" that alternately, can be viewed as a seamless whole. The Process Model attempts to describe individual transformations for each structure that is introduced in its structural counterpart. Therefore, a structure that has been given four developmental stages will be assigned an operator between each step. A secondary structure of this sort will be described as a 2nd order structure of 4th order operations.

[35] I introduce this level of graphic complexity to give the reader a simplified re-representation of the kinds of dynamic interactions that go on in Herbert Guenther's (1984) *Matrix of Mystery*, in which "simultaneously encircling and encompassing oscillating isotropic radiations" radiate outward, creating "omni-directional outward-pushing fields;" the former, he calls "the inextricably connected dynamic nature of homogenous openness and isotropic omnidirectional lucency (stong-gsal dhyer-med), and the latter, he terms the "meaning saturated field of pristine cognitiveness (chos-dhyings ye-shes)" (pp. 49-51) —none of which can be imagined to be limited to a three-dimensional interpretation such as ours, rather, Guenther's graphics requires one to be able to imagine many more multiple levels of dimensional space.

[36] http://wilber.shambhala.com/html/books/kosmos/excerptB/part2.cfm

Process Model suggests that enfoldment, *rather than being essential to an integral view, is conditioned by only a particular view (the structural one) and therefore enfoldment itself needs to be contextualized.*

We can look how different creation stories arise from a different set of enfoldment conditions as a simplified example of how these conditions constrain our notions of reality. For example, if I start at the far end of the "one" vertices and move in a clockwise direction, I arrive at the typical Western scientific view of creation: Starting with the One Singularity, an Exterior world was created and the Many things combined and evolved until Interior consciousness evolved, giving rise to the sense of One self, namely me. Or I can start from the far end of the interior vertices and move in a counter-clockwise direction, and tell a radically different story: Starting at the far pole of Interiority (aka radical emptiness) arises One self in which arises the Exterior world of maya, in which the illusion of Many and separate Interiors (other(s)) namely me. If we "reverse" direction of movement in either of the above two stories, we can create different involutionary narratives. In the first sequence I unfold from, and am part to whole of a greater Exterior reality; in the second sequence, the world unfolds from, and is part to whole of a greater Interior reality.

These are simplistic versions of rich, complex stories shown here to illustrate how using the Process Model can generate the kinds of meta-narratives that are the foundations of our beliefs about reality. To move into a more sophisticated use of the Process Model, we begin by examining how it can support a process theory of cognition—a central issue in any integral metatheory. To do this, we will look in more detail at a modern process theory of cognition, and see how it can be mapped onto the Process Model.

Cognitive Microgenesis

Jason Brown (1991, 1996, 1997, 1998, 2000, 2002) has used the termed *Cognitive Microgenesis* to describe the process-based theory of cognition that he developed through years of clinical research on linguistic pathologies, as well as pathologies and anomalies concerning object relations. Simply stated, cognitive microgenesis says consciousness is a symphony-like process in which innumerably simultaneous "waves" advance from an unarticulated core through discrete steps (micro steps) toward a more and more fully articulated cognition, and then recede back to the core through the same steps. These micro steps are:

Core > Presence > Affect > Image > Object(body) Space > Object(world) Space

Microgenesis describes a process of *articulation*, in the sense of a further and further reaching out from a central core, so that we can say of the above sequence, presence articulates to affect, affect articulates to image, image to Object(body) Space, and that Object(world) Space is the final (or mature) articulation of the cognitive occasion. In addition, the innumerable simultaneously articulating waves do not necessarily reach the same levels of articulation, and are in different phases of advancing and receding—together which constitute the complex landscape of the cognitive occasion. In turn, each cognitive occasion is determined by a particular length or duration over which the microgenies are summed to produce it. Finally, the entire complex landscape of microgenies can be imagined to grow out in a branching structure, like an evolutionary tree, with mature forms arising and receding, with interference and resonance creating something along the lines of what Stuart Kaufmann (2000) calls "a fitness landscape"[37] that lays down both the evolutionary history and the future potentials of cognition. This and many other implications stemming from Brown's theory of Cognitive Microgenesis concern topics outside the scope of this article, but I introduce them to give the reader a summary overview.

These "steps" can be described briefly as:

Core: The unarticulated core is aspectless.

Presence: … is the spontaneous potential of a cognition—the simple feeling of being.

Affect: Cognitions that articulate to affect stage are primordial feelings, like a deep intuitive feeling that has not yet attached itself to an image or word. For example, it is common to wake up from a dream with a clear "feeling" of the dream without being able to ascribe images or words to the dream. For example, instead of being able to say that in the dream "I opened a door," one would be pressed to say "*it was as if* there were a door and I opened it." The affect level "meaning" is clear, but it is only after the fact of awakening that we are required to search for appropriate or sufficient symbolic or linguistic forms for it—and the measure of sufficiency of those attempts can be gauged against the clearly present affect. Affect-level cognitions are not to be confused with "emotions," which are more complex structures.[38] [39]

Image: Image stage cognitions are like dreams that have an image form, thinking in pictures or symbolisms or various sorts, and visual hallucinations (pathological or otherwise); images that are not yet associated with or alternately have become dissociated from, the concretizing operation of object perception.

---

[37] The concept of a fitness landscape with respect to a population of cognitive microgenies is a significant hypothesis of the Process Model, with huge implications on the nature of cognitive development and evolution. In *Investigations,* Kaufmann writes;

> [consider] a population of replicators, say viruses or bacteria, evolving on a fitness landscape with many peaks of high fitness, valleys of low fitness, and ridges. In general, if the mutation rate is low enough, a population located at one point on the landscape will have a few mutants, one or two of which are fitter. These will replicate faster than the less fit cousins, eventually replacing them, so the population as a whole will move to the new point of higher fitness on the landscape. If the process is continued, the population will climb steadfastly uphill to a local fitness peak and remain in its vicinity (2000, p. 155).

If we imagine populations of microgenies evolving on a fitness landscape, where the fitness relationships among them are complex patterns over ranges of constructive and destructive interference, we can imagine a process through which cognition advances not only further from the core, but also through novel forms.

[38] The affect level of cognition is strikingly similar to what Gene Gendlin calls "felt-meaning," meaning which is implicit, that is, prior to any explicit forms, such as symbolic or linguistic thought. Here is Gendlin (1997a) describing it:

> Consider a poet, stuck in midst of writing a poem. The poem is unfinished. How to go on? The already written lines want something more, but what? The poet rereads the written lines. The poem goes on, there, where the lines end. The poet senses what that edge there needs (wants, demands, projects, *entwirft,* implies . . .) But there are no words for *that.* It is ah, uh,. . . . The poet's hand rotates in the air. The gesture says *that.*
>
> Many good lines offer themselves; they try to say, but do not say—*that.* The blank still *hangs there*, still implying something *more precise.*
>
> The . . . seems to lack words, but no. It knows the language, since it understands and rejects—the lines that came. … It knows what must be said, and knows that these lines don't say that (p. 17).

[39] Pathologies of the affect stage are paranoias—the feeling/affective layer is not susceptible to objective or rational interpretation that otherwise would present contrary evidence.

Object(body)Space: Further articulation of the cognitive process generates the spatial dimensioning of the kinesthetic body and its perceived "dominion"—that of the will (willing my finger to move, for example).

Object(world)Space: The furthest articulation (or discharge) in Brown's theory of microgenesis. This is the point where cognition has articulated to object orientation that constitutes a world. We shall use our process model to take this articulation two steps further than Brown has proposed.

Brown describes the process of cognitive microgenesis in terms of discrete steps. To map this with the Process Model, the discrete steps of his micro-process can be seen as structures generated by moving through the Epistemological Field. We can easily map the microgenetic steps as enfolded (micro)structures onto our process model and create a model of cognition, as illustrated in Figure 8 (See Appendix A: Figures).

Brown's micro-states are represented as structures that are enfolded in a developmental series, building layers through clockwise movement.[40] Moving clockwise from the central "core," this movement progresses from the "deep interiority" of pure presence toward greater degrees of exteriority, through the steps of affect, image, object(body) space and world. As the microstructures build up like layers of a conch shell, there is a consistent dynamic associated with the progressive exteriorization of cognition. As pure presencing begins to articulate affect and images, a "self" is imputed as being "subject to" affects and images. In conventional cognition we still consider that feelings and dreams are part of our interior, and not somewhere "out there" in the world; yet there are micro-layers delimiting a deeper interior of affect, and an outer layer of image. (We are not our dreams, for example, but we have dreams, i.e., dreams are "exterior" to a deeper presence.)

Moving clockwise in the process model, we progress from "one and interior" toward "exterior and many." This is associated with a persistent dynamic—a progressive loss of agency that correlates with operations along the one-many valence (or the arising of a shared world). The affect level then "recedes" to a new interior layer, as the cognition articulates to image stage, which "emerges" into a new, yet still interior level—we still feel that feelings and dreams pertain to our sense of self and agency, more so than to the world "out there." But as cognition further articulates toward exterior and the first object cognition arises as "body," there is a sense of shared or relational agentic aspects that arises as the notion of internal *will*—the feeling of internal agency—and *intention*—the projection of will out in the world. The body represents the boundary between these two senses of agency, and is itself a combination of the two, since we feel we can will our body to act, but we do not have control over all the activities of the body.

Finally, further articulation of the microgenetic series toward the 'many' generates object(world) space. At this stage, interior agency completely withdraws, as we come to know objects in a world space that operates according to external causation and the independent laws of nature.[41]

---

[40] In other words, the conditions of its structural enfoldment are (1) clockwise direction, (2) revolution in a field of valences, (3) deriving interior-exterior and whole-part relations.

[41] This of course describes the microgenry of conventional cognitions based on Newtonian view of reality. We can use the process model to describe trans-conventional cognitions also. For example, out of body experiences can be described as cognitions in which instead of an exteriorizing object-world "outside a receding self" (central agentic node), the self is experienced as outside of the object-world that

Mapping the cognitive microgenetic series onto the Process Model reveals the dynamic operators of cognitive articulation: a) *emergence* characterizes the phase from core to presence; b) *articulation* characterizes the phase from presence to affect; c) *withdrawal* characterizes the phase to image stage; d) *will* characterizes the phase to object(body) space—the final vestige of interior agency in a progressively exteriorizing cognition; and *protraction* characterizes the cognition of object(world) space.

Here is where Brown's theory ends, with the articulation of an independent subject sharing agency with an exterior world. While Brown considers the problem of other selves a condition of object relations, we can utilize the Process Model to continue to map the cognitive process from world(space) or the domain of 'exterior and many' all the way around the Epistemological Field, toward the 'many and interior' and finally back to the 'interior and one.' Proceeding through the Epistemological Field, clockwise from object(world space) and the inter-objective domains, we then generate other selves, or the inter-subjective domain. In the Process Model, the dynamic operator from world to others is *projection*—corresponding not only to the recognition of other human selves, but also associated with the dynamics of primary projections onto non-humans, animals, dolls, amulets, idols, etc. A complete turn ends with the operations between the 'interior and one' which constitutes what Whitehead termed *subjective unification*; or a coherence among parts; namely the experience not of a series of operations, or discrete stages, but a unitary expression of the enveloped parts as one structural whole (aka "self-world-other" or Wilber's co-emergent quadrants).

With respect to a structural view of integral theory, the Process Model asks us to think in terms of micro-steps that are transformationally related through a generative process. We can describe these transformations as operators that generate self-world-other. At a meta-systemic level call it A!. The processes in transformational relation to and generated by A! are:

emergence→articulation→withdrawal(1. will 2. intention)→protraction→projection→unification

Thus A! is the generative process that creates the complex landscape where

---

arises within it. Stable out-of-body experiences verify that the conventional subject-object/interior-exterior relations are, as Guenther noted above, "*far from being normative for all experience,*" but dependent upon the conditions of structural enfoldment—the very framework through which cognitions arise. Experiences such as these also verify the notion held by process thinkers, that all relational change within a process—relations between structures, stages, "things"—are more like "Cambridge Properties" than real properties; in other words, they are not real changes, but rather are properties of an event only from a certain perspective, such as changes in relative motion, all of which depend upon a situated frame of reference. A stable out of body experience makes this very real—of numerous experiences of this kind, I have had the opportunity to note how the sounds and kinesthetic aspects of movement still point *to that moving is happening*—like the truck I can see myself driving "down there" from my vantage point of 30,000 feet above the world—but that inference *that something is moving*—is more like an intellectual assumption, since for all intents and purposes, nothing can actually be *seen moving relative to anything else.* That this is the case is consistent with the out-of-body cognition that the world and all its occurrences are happening "in me" rather than there being a "me" that is negotiating within a world "out there;" like the passenger on the train, he cannot "see" that the bag at his feet is moving at 80 miles per hour.

‘presence,’
  ‘presence-affect,’
    ‘presence-affect-image,’
      ‘presence-affect-image-object(body),’
        ‘presence-affect-image-object(body)-object(world),’
          ‘presence-affect-image-object(body)-object(world)-others,’
            ‘presence-affect-image-object(body)-object(world)-others-unity’
              (and their respective, receding counterparts).

are in continual transformational relation. It is important to note that, from a process point of view, these micro-structures are not nested sets, but a much more fluid and dynamic set of articulations in continual transformation. In Brown’s (2002) words:

> Stages in the microgenetic series are not only levels but ancestral minds given up in the growth of new form. A stage that is traversed can also be outcome depending on where the process terminates at a given moment. When a preliminary stage becomes a final one, as in a dream, the stage is part of another mental space. Intermediate levels in this transition are not traversed and abandoned in the progression to endstage, but lay down content at each ensuing segment. *The sequence is not an ascending stairway where each step is bypassed, nor is it like the passage from ice to water to vapor where physical effects on a single element impel it through a series of forms. Rather, the microgeny is like the growth of a sapling to a tree, or a child to an adult, where the form of the juvenile slowly disappears into that of the adult, but that which in the juvenile is unchanging continues long after in maturity to play a shaping role* (p. 46, emphasis added).

The various microstates don’t stack up like the single line-levels representing structure-stage development. Rather, the full landscape of the numerous microstates develops over duration, like evolutionary branching of species develops over deep bio-geologic time. When the structural-stages are represented as a line on which are arranged developmental levels, it is easy to imagine that the later levels both transcend and include the previous levels. There is simply no where to “put” what has been left out, when the paradigm is a series of neatly nested sets. From a pure process view, development does not proceed in neatly nested sets, but through a continuum of transformation that prescribes a kind of evolutionary tree, or a process of later forms branching out from common prior forms. It is a process of iterative parcellation. On any given branch (or within any single microgeny) each later form includes one or more “mutations” or maturational steps, like a root system creating an intricate network of roots, or the cauliflower-like organization of the brain’s surface—innumerable parcels stem from terminal mutations. If we trace a mature form back to the core, we map a single local narrative, along the route from which it came. If we benchmark our developmental story to this local narrative, we “see” a single series of development. Our story has no capacity to “jump” across branches to other, simultaneous events in the larger branching whole. A structure-stage approach is analogous to limiting oneself to only one of the branching routes. Hence, the single line approach used to describe developmental lines in a static, structural framework. Brown (2002) writes:

> Branching is a mode of cognition and evolutionary growth; it is how something new happens. In this way it is at the heart of the creative process. A mutation is a new idea in

> evolution. In cases in which the mutation has an evolutionary impact, it appears as a change in development at a relatively early phase in ontogeny. Although encoded in the genes, the mutation is a downstream change in the developing organism, a disruption at a *subsurface* phase in maturational growth.
>
> New ideas occur in the same way. An idea does not emanate from the play of introspection but is a deviation—a type of conceptual branching—at deeper form-building layers. The idea emerges from below, rises up, and is disclosed to consciousness. Creativity is a flight from deliberation in the service of a concept rising from below. This is also true for the deep appreciation of creative work. One can say, truly, that you discover the creative by falling into its parts and letting them discover you.
>
> Novel configurations in cognition and development are constantly being generated in this way, either to persist and gradually transform the organism or disappear, submerged, in the weight of habit and the flow. Every so often, however, the slow incremental advance of mutations and ideas gives way to a leap in evolution and thought. The mutation transforms the organism as a great idea transforms cognition (pp. 47-48).

The Microgeny of the Conceptual

In the Process Model, the Epistemological Field is imagined as a field of forces, and the microgenesis of *conventional* cognition is a generative process being "driven" in that field from interior to exterior through whole-part transformations. Each cognition discharges to a specific form (a length or breadth that defines its "duration"); its duration in turn determines the cognitive event that arises, whether it be a primordial affect, an image, or a fully exteriorized world—and then each process recedes back to the core through the reverse sequence of microstates. The sum of numerous microstates going out and receding constitutes the full spectrum of what arises as self-world-other. From a structural point of view, we can say that the seven transformational operations that generate this spectrum generate a 2nd order "structure." This 2nd-order structure, S^2, completes itself with the operation of unification. In the Process Model, S^2 itself can be imagined to be subjected to a higher-order level of iterations in the process field. We can do the math as follows:

$S^1\ 1 \rightarrow S^1\ 2 \rightarrow S^1\ 3 \rightarrow \ldots\ S^1\ 7^{\uparrow} \rightarrow S^2$ where S^2 stands in for $S^1\ (1 \rightarrow 7)$ at the next processural level.

We can try to (loosely) map the microgenetic sequence onto a developmental narrative of human cognition. It is difficult to judge just when the human body-mind articulates a presence and affect level of cognition. But it is known that human fetuses dream by the second trimester—which corresponds to S^1 3 or the image level of articulation. Does a dreaming fetus have a sense of "self that dreams?" No. A "sense of self" arises only at S^1 7—the step at which subjective unification occurs. The fetus dreams, but is not "a dreaming self." S^1 7 correlates to the level of concrete operations. This is the level in which the original cognitive drive from core to world, discharges as action or behavior.

Can we then map a process of higher orders of cognition where S^2 is the starting condition (or alternately, S^1 [1-7] is *the set of* starting conditions) which iterates in the process field to generate concepts; and then again values? Again, following Brown, we can map such generative processes. Starting with S^2 another layer of transformation is created as we move a second go-round through the process field. This requires that the cognitive drive to discharge as action or behavior is sufficiently interrupted to propel a new mutation or parcellation over the duration of the microgeny. In other words, an entirely new "family of microstates" branches out, generating the conceptual order. The impulse to discharge as action-in-the-world splits off from a single-choice field towards that actional discharge into a novel series of microstates, constituting an entire range of conceptual enfoldments. Where the bifurcation occurs determines the affect, image, and intentional content of the concept—but the concept itself completely exteriorizes in the "field of the subjective self," which we have assigned the S^2 label. We begin to think our thoughts, bringing implicit feeling "forward" in reflection, in symbolic images or conceptual ideas.

In the conceptual order, concepts themselves fully exteriorize in the way objects had exteriorized, that is, through a withdrawal of agency. As is the case of the "objective world out there," when fully exteriorized (at the rational level), concepts themselves begin to be seen as independent *things* that function by *independent laws such as rules of logic and reason*, just as the object-world is seen to function by *independent laws of nature*. At this level, the primordial temporal and spatial aspects arising in the process field—the original "here-and-now"—acquires a secondary reflective aspect, in the protraction of an independent and abstract space-time field, in which operations are not uni-directional, but theoretically, that is to say, conceptually, reversible and therefore relativistic.

In the microgeny of the conceptual field, there is a kind of interruption or cessura, pointing to a functional neonaty in the higher (neo-cortical) levels of cognition. The act can be interrupted, and reflected upon, conceptually. However, the concepts themselves can reach a level of reification, which effectively discharges the impulse, completes or terminates the generative sequence into a mature form—the conceptualized occasion. It is here, in the conceptualized occasion (as in the lower-order actualized occasion), that the prior infinite potential is discharged into a finite actual, this time resting in a conceptual order rather than in an object(world). Yet this actual is finite in its duration also, and so impermanent, and the process repeats, returning to infinite potential, accompanied by a drive from the core, operating in a field of forces.

We can take this process further afield through yet higher-order transformations, where concepts themselves mediate between immediate apperception-and-action, through speech and other symbolic acts—a higher-order rule of projection, wherein the concept field is exteriorized to shared intersubjective space.

The Microgeny of Value

But what of values? How do they relate to cognition and concept in the Process Model? Consider how Figure 9 (see Appendix A: Figures) illustrates the primary microstates along a spiral path starting from the core at E^1 and ending with the primary quadrant-level components, self-world-other at E^2. From there, a second-order process diverges into microstates along a spiral path ending at E^3. The path $E^2 \rightarrow E^3$ represents the values stream, and completes with the condition of self-world-other-beliefs. Beliefs are rather complex human systems; but the Process

Model suggests that they are systems that arise through a complex web of relations between conditions governing microstates in a process field.[42]

These value-microstates follow a path that parallels the primary cognitive microstates, the path from interior to exterior articulation and through whole-part transformations (parcellation or branching). The values micro-stream goes:

existence > interest > attention > desire > worth > universals > beliefs

According to Brown, the fundamental level of value is existence. What exists for us has inherent value; what has zero value simply never arises. I look out over a springtime meadow, taking in all the colors and textures and aromas. My eye settles on a daisy—not just any daisy, but just this particular one. My mind relaxes in the joyful play of this daisy and I. These are the inherently valuable existents which exteriorize for me over the durations of the cognitive moments. For the bee, bird and butterfly, there are a set of different values, hence a different set of existents.

Primary value then is laid down in the course of the microstates over the various durations of microgenesis. This means, self-other-world arises not as a neutral condition, but already hugely constrained by the conditions of their generative process.[43] Add an affect layer, and existence is imbued with a sense of realness, and *interest in* the real arises. As agency withdraws, value is exteriorized outward as *attention toward* the object(s) of interest. As the values stream further exteriorizes into body(space), attention exteriorizes in the body—the boundary between self and world—as desire. Desire in turn reaches out into the world as desir*e for an object,* and subsequently conceptualized as the object's *worth.* Projection of object worth into inter-subjective space generates the universals (the good, the true, the beautiful). And finally, universals, when incorporated into the self in the process of subjective unification, create the self-system-in-beliefs.

There are extraordinary implications for thinking about values through a process view. This view can be seen to be the same view as the Buddhist notion of root cause. The Process Model can be used to trace beliefs back to root causes in desire, and beneath that, in the nature of mind and cognition. Self-world-other may arise as an inimical triumvirate, but they are not value-neutral. The processes that set down the conditions of their arising, moment to moment, are inherently absorptive of all kinds of conditions determining even the most primitive values. Understanding those conditions can help us design transformative practices for rendering them transparent.

---

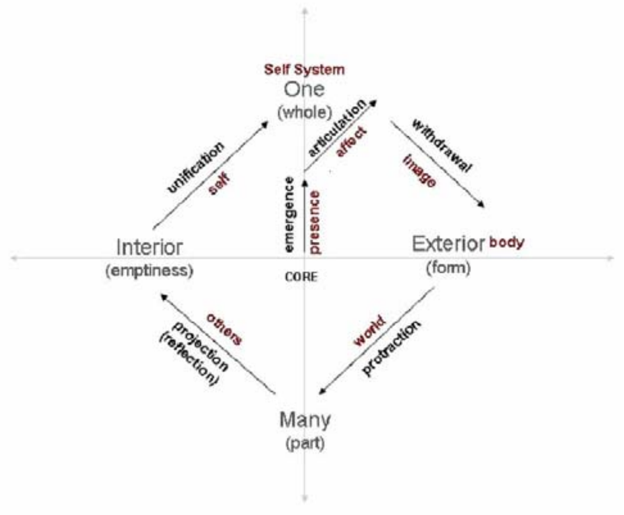
[42] Note, because this section deals with the processes of *cognition*, it does not account for the conditions external to consciousness which co-determine of the emerging microstates. It is important to note, however, that the nature of these "external" conditions are neither objects nor other subjects per se, since the process model shows us that objects and other subjects are internal to the cognitive process. What then can these "external" conditions be? In future articles I intend to discuss how the Process Model can help describe them, and serve as a bridge between Integral Theory and some of today's most important new thought on process and generative order.

[43] This is one of the main reasons why deepening your integral practice requires you to delve into the subtle nature of mind-and-world, or simply, MindNature. Practices such as Mahamudra and Tibetan dream work and dark retreats work are designed to render the cognitive processes transparent, so that we are no longer bound by their hidden conditions, but liberated to dance creatively in the dynamic field called "mind."

If we chart both the cognitive and value microstates according to the sequence of operators which drive the cognitive microstates, we can easily see the iterative nature of the process field.

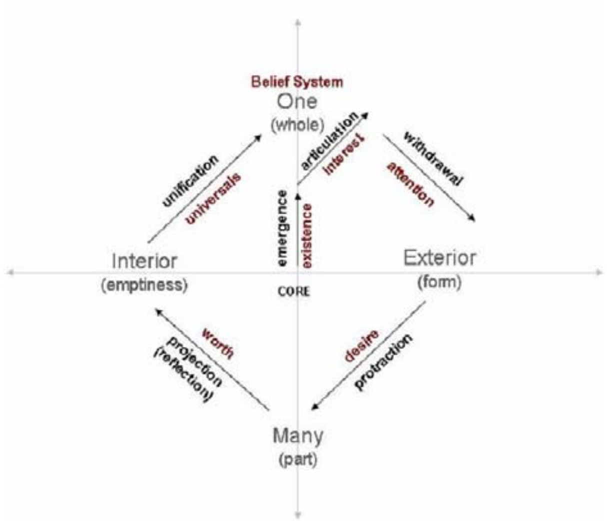
Operator	→	Cognitive Microstate	Value Microstate
		Core	Self (ego)
Emergence	→	Presence	Existence
Articulation	→	Affect	Interest
Withdrawal (1)	→	Image	Attention
Withdrawal (2)	→	Object(body)	Desire
Protraction	→	Object(world)	Worth
Projection	→	Others	Universals
Unification	→	Self(ego)	Beliefs

We can see the parallels in the micro-series illustrated in the following figures:



Self System
One
(whole)
articulation
affect
withdrawal
image
unification
self
emergence
presence
Interior
(emptiness)
CORE
Exterior
body
(form)
others
projection
(reflection)
world
protraction
Many
(part)

Figure 10. Self System



Belief System
One
(whole)
articulation
interest

attention
unification
universals
emergence
existence
Interior
(emptiness)
CORE
Exterior
(form)
worth
projection
(reflection)
desire
protraction
Many
(part)

Figure 11. Belief System

By linking the self-system with its values streams in this way, we can start to look at the genesis of beliefs from a pure process view, namely from the transformations that operate in the wave of cognition from core to world and in return. If these processes are conceptualizable, then it may be the case that they can be made realizable, that is, transmuted into phenomena that can be experienced by the self, rather than properties that condition or constrain the self. This is the Mahamudra path toward liberation.

Conclusion

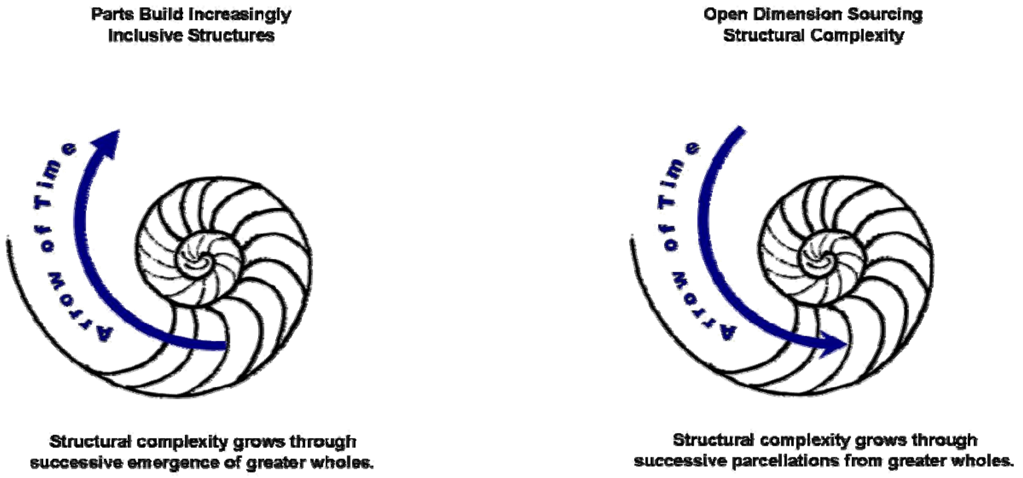
> *I was poking around a shop at the seashore and happened upon a large chambered nautilus. It had been carefully sliced open and mounted so as to display both the inner and outer sides of the same shell side by side. On one side, I saw a succession of chambers that began very small and grew evenly as they followed the graceful arch of the shell's unfolding spiral. To me, each chamber represented a human life, a finite stage in larger development, always followed by another larger than it. Round and round the lives unfolded, spinning the archetypal spiral of cyclic yet infinite development.*
>
> *Next to this spiral of chambers was mounted the outer wall of the same shell. This side spoke of wholeness, for it showed a colorful pattern of strong brown lines that integrated and unified the chambers within. The design was so masterfully executed that it looked as though an artist had picked up a fully grown shell and painted it with a few broad strokes. The brown streaks cut smoothly across the shell's inner chambers as if they weren't there* (Bache, 1990, p. 109).

All of reality presents itself in the way of the nautilus: how nature reveals herself to us is conditioned by the perspective(s) we take, that is, by the epistemic framework we build to receive her. If we have only static structural categories in that framework, nature will reveal herself as a succession of structurally related parts, that is, parts related by the *conditions of structural enfoldment in our framework.* We might hear nature speak, but never hear her sing. There are two video clips on the web that give good examples of conditions of structural enfoldment.

One can be accessed at http://www.youtube.com/watch?v=Zkox6niJ1Wc. It shows a metal plate that vibrates at increasingly higher frequencies. A white sandy substance is dusted on the surface of the plate, and at certain intervals, the white sand creates intricate patterns. The patterns themselves go through a patterned dynamic—some phases of increasing fractal complexity, other times creating a newly simplified, novel pattern. Although the frequency rises at a fixed rate, the patterns "emerge" only at certain intervals. What determines the static appearance of these patterns constitutes the conditions of structural enfoldment of the system. These conditions have to do with the nature of the sand, gravity and the like *but also with the nature of the "operational system" that is experiencing the show*—the sand reveals itself in patterns in ways that we can perceive patterns, and as chaos in ways that we cannot perceive as patterns.

The video of Nate True's Time Fountain, at http://cre.ations.net/creation/44, demonstrates the temporal conditions of structural enfoldment. By creating the illusion of stopping or reversing time, the Time Fountain changes what we experience of the fountain. It is because we benchmark a fixed direction of time, that the illusion is successful—the strobe is designed to take advantage of what we have habitually inferred as being fixed properties of time. Experiments like these point to the limits of our perceptual apparatus. But perceptual illusions of this sort are *only possible because we receive them in a limited frame of reference—one that is temporally conditioned by an arrow of time.* It is not only conceivable, but also possible, to experience our perceptions in a more open, transparent way, where time is not a condition of that experience, but the temporal framework itself is seen to arise within the dynamic field called "mind."

Consider for example, the role of time in the following figures:



Parts Build Increasingly Inclusive Structures
Arrow of Time
Open Dimension Sourcing Structural Complexity
Arrow of Time

Structural complexity grows through successive emergence of greater wholes.

Structural complexity grows through successive parcellations from greater wholes.

Figure 12. Arrow of Time

Both diagrams illustrate a process of structural growth, but the temporal condition of their structural enfoldment—i.e., the arrow of time—is switched between the two. In the first diagram we "see" prior parts building greater and greater wholes. This corresponds to Wilber's structural, holarchical view. In the second diagram we "see" a series of finer and finer parts parcellating from prior wholes. This correlates to Jason Brown's theory of microgenesis. In process language, the former "sees" actuals realizing more of the "original" potential; the second "sees" original potential generating more and more actuals. There is also an "interior-exterior" condition that distinguishes the two views, represented by the spatial regions in the illustrations. The first view "sees" complexity as an ever-expanding evolution into an unbounded aspectless "exterior" wholeness; the other "sees" an unbounded original wholeness penetrating infinite "interior" depth.

If we can agree that there is some truth to both of these views, then it must be the case that each view is *true but partial.* However, since they both arise from a structural approach—within a structural framework which is *itself limited* by the very same conditions of structural enfoldment—that framework cannot show *how* they are true and partial. A structural approach, therefore, is forced to choose one over the other. Only a process approach has the capacity to widen the view beyond the conditions of structural enfoldment, so that they no longer constrain our view, but are contextualized by it. A pure process view, such as a generative process, says that the all of the actual is already *in* the potential as potential actuals. You cannot have, as Rescher (1996) describes below, the notion of an arrow of time pointing to future development, without already having ascribed future actuals as present potentials.

> An important merit of process philosophy is its ability to avert difficulties that afflict substantialism. Consider just one example. Seeing that future things do not (yet) exist, substance metaphysicians have difficulties with the future and cannot confidently accommodate it in their ontology. Process metaphysics avoids this difficulty from the outset. For the processural nature of the real means that the present constitution of things always projects beyond itself into one as yet unrealized future. You cannot claim the arrow is moving now without committing yourself to its occupying a different position in the future. The future has its place within the processural present, seeing that the present is pregnant with the future (p. 54).

Likewise, a generative process says that, simultaneously, all of the actuals reflect their prior "formatted" potential, in the process of realizing (actualizing) themselves. You cannot have, in this instance, the notion of an arrow of time having come from the past potential, without already having ascribed those realized actuals as inherent in that original potential.

Referring then to the set of diagrams above, a pure process approach sees they are saying the same thing, namely that potentials are generating actuals, and actuals are realizing potentials, regardless of the arrow of time—it has been rendered transparent. The whole-part condition between the two has also broken down, since potentials and actuals are *both whole and part to each other*—on the one hand, there is all of the actual potential (but not all of the actual) in the potential, and there is all of the actual (but not all of the actual potential) in the actual.[44] In other words, generative processes are "Janus faced"—they look in two directions at once, inside and outside, past and future, whole and part.

The Process Model goes even further than this. The Process Model shows us that *neither* of the two has the capacity to reason into the ontological dimension, neither has the capacity to address what is your ontological view, since neither has the capacity to go beyond its, and their, conditioned epistemic relations. The problem we face is that our deepest spiritual concerns are ontological ones, and yet we allow our spiritual notions to either flounder around or compete with each other in limited epistemological frameworks. The Process Model points to a different place entirely. It says that although one cannot reason oneself into a deeper ontological view, one's ontological view deepens *from the kinds of ontological encounters we are open to receive.* Furthermore, it warns, the most limiting factor in our ability to *open up* to those encounters is our continual embeddedness in one or another, or even a spectrum of epistemological frames of mind, also known as, "perspectives."

---

[44] This is the explanation of what was proposed earlier, namely that a process approach can legitimately express that P generates A *and* A actualizes P.

This, then, underscores the essential distinction I made at the beginning of this article: a view cannot arise *within or from* a perspective. Rather, *how the perspectives are viewed* arises from a deeper, more fundamental—that is, *ontological*—view. While I consider one of the greatest contributions to integral theory is Wilber's integration of the "Big Three," the "I, We, Its" through the notion of perspectives, I also think the Process Model points out the need to integrate the *Field of the Big Three* (i.e., the Epistemological Field) with the Dimension of the Ontological, through just this notion of view and the role of the ontological that the Dzogchen thinkers have assigned it.[45]

---

[45] The Dzogchen notion of *view* is incredibly rich and inherently difficult to describe. I only hope to have been able to give the reader a good sense, first, of what can't at all describe *view*, and secondly, a way to begin pointing out the ontological dimensioning of the notion of *view*. What I have expressed, however, is merely an iota of Dzogchen understanding which posits a state of "authentic open awareness" which corresponds loosely to a state in which there is "no longer a view" or alternately, a thoroughly open view, which Klein and Tenzin Rinpoche (2006) term "authentic open awareness." You can see the connection between this "authentic open awareness," and the ontological dimensioning of *view* in passages such as:

> The view established through reasoning is not the authentic state of open awareness. That state must be described in ontological as well as epistemological terms; hence the conflation, experientially and philosophically, of unbounded wholeness with open awareness. Unbounded wholeness is how and what reality is. In that sense it is an ontological term. Open awareness, fully present to that state of wholeness, is the knowing of it. It is an epistemological unity; open awareness experiencing itself as unbounded wholeness. Establishing the view is not a method for realizing the view (p. 6).

The complexity of Dzogchen thought is nearly incomprehensible. For example, the above passage points to an "epistemological unity;" but the dichotomic mind, according to Dzogchen, is the *vehicle* of knowing. According to Klein and Tenzin Rinpoche, the Dzogchen "resolved" this problem by considering that authentic open awareness is not a consciousness at all.

> Unlike inference and direct perception in classic Buddhist discussions of mind and logic, reflexively authentic open awareness does not take the measure of anything. There is no process of authentication associated with open awareness at all; it is simply, in and of itself, authentic to its own nature. This is possible because, again, open awareness is not a consciousness. This is its unique epistemological characteristic, privileging it over all the other authenticators (p. 37).

Appendix B:
Guenther Notes

For readers familiar with the work of Herbert Guenther, I have excerpted passages below that contextualize some of the ideas present in the Process Model with respect to corresponding ideas from Guenther's writings. The excerpts below also serve to illustrate Guenther's characteristic style of experimenting with language that could convey pure process thinking.

Footnote 7: Here Guenther (1989) describes the difference between an objectivists' view of process and a pure process view. The objective view starts with discrete objects, describes relations between them, and finally, derives processes to explain those relations. The result is that the processes are prescribed by the objects and then assumed to be the processes that generated the objects in the first place. The Yogacara thinkers created the practice of focusing on directing attention and awareness into the dynamic process—a practice that enabled them to eventually watch the actual creation of objects, and then their relations, in the field of mind/mentation. A pure process view, then, is inimical with the practice of this kind of attention/awareness; for otherwise the view is pre-conditioned and pre-constrained by the very physical or conceptual objects one is attempting to get beneath.

> Objectivists, like other reductionists, are unable to understand the dynamic image of the living individual as it is presented by the Yogacara thinkers through the notion of *yoga*, indicating the process of a person's tuning into the dynamics of life. For the objectivist, nouns, whether they refer to mentation or to a gestalt, … stand for things that are supposed to have properties in and of themselves and stand in relationship to one another independently of any individual's understanding them. However, it is not only the western interpreters of Buddhist thought who started from the objectivists' fallacious premise.
>
> It was the creative approach initiated by the Yogacara thinkers that had the greatest impact on those who came into contact with it. They were not so concerned with the building blocks to which a dynamic system such as mind/mentation might be reduced … . They were mainly concerned with the question of how one could understand oneself in one's psychospiritual development, how one could understand the spiritual way as a process rather than an inert link between two static states. [Thus] the Yogacara thinker's process-oriented view, which emphasizes the human system's process of unfolding, fitted well into the rDzogs-chen view, which emphasizes the system's self-renewal and freedom and expresses a fundamental complementarity in the system's overall dynamics. (pp. 3-4)

Footnote 9: Note the distinction Guenther (1989) makes, below, between earlier versions of mind/mentation which already included dynamic and systemic components, and the new vision of reality. The earlier view considered processes carried on by "discrete atomic entities" and therefore was derived from an atomistic view. The same condition appears in western process philosophy with Whitehead's dominant monad, and Wilber's central agentic nexus. According to Guenther, the later Dzogchen view distinguishes itself as a unitary ongoing process. While both

SOME RIGHTS RESERVED

systems retain mind/mentation at the center of the individual's life, only the later, process view renders transparent the human being's embeddedness in this operational system.

> The emphasis on mind/mentation, not only as a dynamic factor, but as an operational system, is already present in early Buddhist thought, where it initiated a further probing into the dynamics of the system and paved the way for a new vision of reality and the human being's embeddedness in it. This does not mean that the old model was simply discarded; rather the old model was incorporated into the new one and given a new meaning. With mentation at the center of the individual's life, it was clearly seen that the granular constituents of the overall attitude a person displays toward the world and toward himself were more of the nature of distinct modes of a unitary ongoing process than discrete atomic entities. (p. 2)

Footnote 10: In the following excerpt, Guenther (1984) discloses both the difficulty of languaging the Dzogchen view, as well as his persistent intellectual tenacity for experimenting with language to capture it. His approach is truly extraordinary, since almost all contemporary Buddhist writing, outside of repeating the mythic narratives of the traditions, take a soteriological approach, in which the reader is guided by various "pointing exercises" which are meant to direct the reader to deeper levels of meaning which the text has very little capacity to express. Guenther, on the other hand, attempts to create a text that could disclose "this mystery" through language that could convey the simultaneous interconnectedness of mind/mentation, text, and that which was being "pointed out," namely the operational system, mind/mentation.

> Once one begins to probe the essential insights of this fundamental mystery—as understood by the rDzocgs-chen tradition—one is immediately faced with a seemingly insurmountable obstacle to comprehensibility. We refer to a subtle, pervasive simultaneity of complexity, interconnectedness, and dynamic high-energy processes, which is so alien to any "natural attitudes" that one might well be tempted to give up in despair. … however, we shall have to present the reader with an overall perspective of how this mystery itself is understood to constitute that fundamental, pervasive, unified, holistic process whose highly energized dynamics set up the variety of subprocesses and their associated structures which are so feebly indicated by the term "Reality." In doing so it will be necessary to introduce a number of totality unfamiliar terms, for these name unfamiliar perspectives and insights. Although difficult at first, because the nature of what we are probing is most difficult for thought, it is hoped that mentally moving into this admittedly foreign terrain will become easier as the implications of the interconnections of these new perspectives are drawn out. To aid in this task we will frequently resort to analogies with phenomena and patterns of thought already explored, and hence available, within the Western intellectual traditions of science and philosophy. (p. 3)

Footnote 11: In the following excerpt, Guenther (1984) makes a very subtle but clear distinction between different interpretations of the notion of "das Sein" ("Being"). "Being" for Guenther, (as *gzhi* for the Dzogchen) can never be regarded in itself, cannot be pointed to or pointed out, or even ultimately conceived. Rather "Being" is the open-ing—an ongoing activity, therefore a verb, not a noun. Whereas, for example, "emptiness" is that vast space through which "form" arises, "Being" is the dynamic operation, the "tensioning" of open-ing, through which "emptiness and form" arise apposite.

> Insofar as it [*gzhi*] is the ground and reason for everything, always retaining its thoroughly dynamic character, it is a unified holistic process "responsible" for the variety of structures, things, and experiences that are said to make up Reality, yet it must never be confused nor identified with the variegated nature of that which comes into presence. We will "translate" this most elusive and important term (*gzhi*) as Being, thereby indicating the similarity in philosophical understanding between the rDzogs-chen view of Reality's dynamic holistic *ground* and that of Martin Heidegger's view of Reality's nonreductive, essentially open character termed "das Sein." It is crucial to avoid associating the term Being as we shall use it throughout, with any determinate, isolatable, static essence or thing: indeed, Heidegger named all such associations "ontic" and constantly cautioned against reducing the fundamental dynamics of Being to the ontic. (p. 5)

Footnote 25: There are numerous places in Guenther's works where he writes about the dual character of movement—a sample of which is excerpted below. The Process Model discerns these two movements as the operations in the Epistemological Field on the one hand, and the operations of the Ontological Dimension on the other. The following passage clearly illustrates this correspondence with the subject-object bound consciousness *inside the dichotomic structures* of thought relegated to the one (epistemological), and the transformative experience of open possibility, to the other. Guenther (1989) writes:

> On close inspection, this process [mind/mentation as an operational system] revealed a dual character and movement. The first movement presented a continuous transformation in the direction of what is commonly referred to as "consciousness." It is instrumental in the structuring of one's world experience as it becomes predominantly geared to representational and objectifying thinking. In this manner objects exist for a subject which then "grasps," "manipulates," and "controls" them, In this respect, this renewed emphasis on mentation is not very different from other psychologies of subjective dominance. What is new in this reassessment of the operation of mentation is the recognition that the subject-object structure of thought is an emergent structure *far from being normative for all experience*.
>
> The other movement within mentation presents, as it were, a complete reversal of this trend toward dichotomic thought patterns. Not only is the subject-object structure of thought suspended in this reversal, but the experiencer himself is "changed." He no longer apprehends himself as an isolable entity called "subject" among other entities called "objects," which he has to struggle against and control in a vain attempt to preserve his "splendid isolation." Rather he apprehends himself as a way of being embedded in a life-world of open possibilities. (pp. 2-3)

Footnote 33: It is fascinating to note that, 16 years after Guenther (1984) wrote the following excerpt, Stuart Kaufmann incorporates much the same *view* in his book of theoretical reflections on the nature of the origins of the universe: *Investigations* (2000). In it, Kaufmann hypothesizes a fourth law of thermodynamics, in which spontaneous exergonic (negontropic, or entropy-reducing) and nonspontaneous endergonic (entropic) dynamics are linked into a self-optimizing system.

> Experience-as-such is likened to the cloudless autumn sky, a vast expanse of blue which draws us further and further into infinite realms; its “essence” is self-existent pristine cognitiveness; and its “indication is the lucidity present in the variety of cognitive processes [the former correlating to the ontological, the later to the epistemological—author’s note].
>
> Thus, although we have seen that probing Being’s mystery [i.e., epistemological reasoning] entails moving into rather “alien” terrain, paradoxically this very mystery is always “available” to us [note the aspect of being always already], operating in the all too familiar forms of our cognitive processes. In fact, our cognitive processes are relatively low-level instantiations of Being’s pristine cognitiveness. Yet even such low levels are not present as some finitely fixed amount of pristine cognitiveness. Indeed, as beings endowed with a cognitive capacity, we constitute a special, locally bound nexus, [note: this is the local point of view, or the here-and-now that arises through processes in the epistemological field—as is discussed below], a nodal point on the surface of Being itself, through which the full energy of pristine cognitiveness tends toward optimization … [and is known as] Being’s thrust toward optimization. The thrust itself operates so as to dissipate both locally generated entropy, experienced as the welter of affective disturbances, collectively termed Samsara and locally bound negentropy, experienced as the variety of hypothesized states of bliss and happiness, collectively termed Nirvana. (pp. 9-10)

Appendix C: The Process Model “In Conversation” with Ken Wilber on the Mind-Body Problem

Below is an excerpt taken from Ken Wilber’s online article *Do Critics Misrepresent My Position? A Test Case from a Recent Academic Journal*,[1] dealing with the distinctions he makes within the mind-body problem and his corresponding approaches to resolving them. I have inserted a Process Model interpretation after each section to enable the reader to compare and contrast the two views.

KW: Here are the three different meanings of the mind-body problem that I believe are quite common and that I carefully outline in *Integral Psychology*:

(1) For the average person, "mind" often means my conceptual, willing, and intentional self, and "body" often means my emotions, sensations, felt somatic sense, and so on.

PM: A conventional cognition arises through a process of microgenesis in which “layers” of awareness are laid down in a progressively exteriorizing direction. The deeper interior layers are felt as “mind” and the more exterior articulations as “body.”

KW: (2) For many cognitive scientists and various materialists, "mind" means "brain" and "body" means organism. In this usage, the brain is in the body or in the organism.

PM: Research shows that the deeper layers of the cognitive occasion correspond to activity in the lower, evolutionarily older components of the brain, and progressively more exteriorized cognitions to progressively more recently evolved components, specifically stated:

> The sequence leads from brain stem systems generating a spatial map about the body, to limbic formations elaborating a viewer-centered space of dream hallucination, to a parietal system mediating a three-dimensional object-centered space of (and defined by) the arm’s reach, and finally, through visual cortex, the discrimination of object features and the exteriorization of the object to a position in a world around the viewer. (Brown, 2002, p. 7)[2]

KW: (3) For many philosophers, "mind" means "interiors" and body means "exteriors"—or, in general terms, mind means "subject" and body means "object," so that the mind-body problem ultimately means the relation between subject and object. Explicitly following the great nondual wisdom traditions (such as Vedanta and Vajrayana), I divide this

SOME RIGHTS RESERVED

meaning into two subdivisions: relative and absolute (as I will explain)—call them 3a and 3b.

PM: "Mind" and "body" are the conceptual correspondents of two regions of the cognitive occasion undergoing transformations in a field of interior-exterior dynamics. The epistemic relations laid down during this process generates a unified "subject" apposite an "object." The ultimate basis of the mind-body problem is more fundamental than at the level of "subject" and "object" —at the level of process operating in a dynamic field of complementary valences. This explains why the great nondual traditions like Dzogchen can argue for a type of awareness that is subject-object-less; because this awareness emerges at the deepest levels of the cognitive occasion, prior to the laying down the epistemic relations that constitute "subject" and "object."

KW: Now, my major point is that all three (or four) of those aspects of the mind-body problem are very important, but each of them has a different "solution," so to speak. … Notice that in each of the three aspects, *both* "mind" and "body" have very different meanings, and I am simply suggesting that we need to be aware of these different meanings.

PM: The major point of the Process Model is that all three (or four) of these aspects can be integrated by a single process view, and therefore resolved in a more straightforward manner, although both "mind" and "body" have very different meanings in discourse.

KW: (1) The first aspect of the mind-body problem is actually something that developmental psychologists have gone a long way toward solving, or at least explaining in a plausible fashion. Those aspects of the mind that we call "conceptual" or "rational"—such as formal operational cognition—and those aspects of the body that we refer to as "impulses" or "felt sensations" or some such, are related in a "transcend and include" fashion. In this particular regard, the mind-body problem is a conflict between two levels in the UL quadrant …

PM: The aspects that developmental psychologists work with depend upon conditions of structural enfoldment, which governs the taxonomic "rules" of whole-part relations in a specific structure-stage direction. The conditions of structural enfoldment arise through dynamics in a field along the one-many valence. The conditions of structural enfoldment that prescribe development in a "transcend and include" fashion are constrained in such a way that lesser parts give rise to greater (more inclusive) wholes. The Process Model suggests that it is equally valid to prescribe development through alternative conditions of structural enfoldment, namely those that are constrained in such a way that greater wholes give rise to (parcellate into) more explicitly articulated parts. In this latter regard, the mind-body problem is not a conflict between levels in a single line, rather a conflict between populations of forms along multiple durations of cognitive occasioning.

KW: (2) For most materialists, of course, the body is not in the mind, the mind is in the body. That is, mind is equated with brain, and since the brain is in the organism (or in the body), then the duality is "solved" by a flatland exclusion of all interiors … [this] is an important aspect of an integral theory of consciousness, because it involves a systematic investigation of the Upper-Right quadrant, including neurophysiology, brain chemistry, neuroscience, and so on. The solution to this aspect is simply more empirical scientific research; I won't say any more about this aspect since it is fairly straightforward in its contours.

PM: Research in cognitive microgenesis supports the theory that both the "mind" and the "body" are generated by a single exteriorizing process, first laying down deeper interior levels felt as "mind," in processes corresponding to lower brain functions, and subsequent more exterior articulations felt as "body" in higher brain functions. The primary conditions of structural enfoldment in this process are such that the body is enfolded in the mind. However, once the cognitive process articulates to subjective unification, the subject supercedes the primary enfoldment, and acts as if it were the fundamental agentic unit. Thereafter, the subject conventionally perceives him/herself as an object in the world, and as a mind inside a body.

KW: (3) Perhaps the most important aspect of the mind-body problem involves the relation of interiors and exteriors, or the relation of subject and object. As indicated, I subdivide this into relative and absolute approaches, based on the nondual traditions (as I will explain in a moment).

PM: The Process Model demonstrates ***that all the aspects of the mind-body problem involve the relation of interiors and exteriors and the conditions of structural enfoldment (which are the relations between wholes and parts)—relations which are more fundamental than and prior to subject and object formulation****.*

KW: In my opinion—the solution to #3a is best handled by a type of Whiteheadian process philosophy,

PM: as in the Process Model's incorporation of Jason Brown's cognitive microgenesis which heavily relies upon Whiteheadian process philosophy

KW: and the solution to #3b is best handled by a type of Zen awakening or satori.

PM: which the Process Model addresses by pointing to the ontological dimension, and the opening of Being through ontological encounter.

KW: … meaning #3b—the transrational or transpersonal aspect of the mind-body problem—which, I suggest, can be solved only by a development of consciousness beyond the rational mind and into the transrational or supramental waves of development (i.e., the final relation of subject and object is fully grasped only in a nondual consciousness).

PM: the final relation of subject and object is fully grasped only outside the epistemological field of perspectives, that is in transrational or transpersonal ways, through an ontological encounter, or ontological view.

KW: What does that actually mean? To begin with, notice that the "Cartesian dualism" that virtually everybody criticizes involves the notion of a mind-subject set apart from, or divorced from, all the body-objects "out there."

PM: "Cartesian dualism," like all dualistic thinking, is generated by dynamic movement in an epistemic field of complementary valences.

KW: The *ultimate* relation of the subject and object is the ultimate meaning of the mind-body problem (i.e., aspect #3b). On the relative or manifest plane, we can "think through" this mind-body problem and arrive at relative solution—namely, a type of Whiteheadian process philosophy. But we cannot "think through" the ultimate solution, because this involves a transformation of consciousness to the nondual state.

PM: Jason Brown's process theory of cognition arrives at a relative solution—one that helps contextualize the structural conditions in various developmental theories of cognition. However, we cannot use any of these theories to ***think through the ultimate solution****, because we cannot reason into the ontological dimension. We can, however, transform our view through an encounter with the ontological dimension of Being—and experience the nonduality of the relative and the ultimate solutions. More specifically, in the ontological dimension we clearly see* ***that the situation of relative and ultimate solutions arises only under epistemic conditions****.*

KW: There is thus a simple "test" for whether I have solved this aspect of the mind-body problem: if I feel that I am on "this side" of my face looking at the world "out there," then I am still held captive by the Cartesian dualism, even if I am thinking nice Whiteheadian thoughts. It is only when there is a profound realization (satori) that I am not merely "in" this particular body-mind looking out on the world, but rather, I am everything that is arising moment to moment—an immediate realization that has no inside and no outside,

PM: A simple test for an ontological awareness is whether there is an implicit interior-exterior or one-many divide anywhere in consciousness. A profound realization is an ontological encounter—a collapsing of and liberation from the dynamics along the epistemic valences. "Body-Mind Drop" is a collapsing of the interior-exterior valence, while the Dzogchen view of Unbounded Wholeness is a collapsing of the one-many valence, where ultimate View and relative view are not two …

KW: …but only an ever-present awareness that is one with all manifestation—that there comes a deep and ultimate understanding of the relation of subject and object—or so claim the great nondual wisdom traditions. That is aspect #3b of the mind-body problem and its solution according to the nondual traditions; and I believe that that is the fourth aspect of the mind-body problem that very much needs to be included in any integral approach.

Appendix D:
Wilber, Whitehead and the Postmodern Condition

In addition to incorporating Whiteheadian process theory into his more recent writings and thought, Ken Wilber has also made important critiques on the inability of Whitehead's process philosophy to incorporate the postmodern emphasis on intersubjective components of subjectivity. In an appendix to his online article *Do Critics Misrepresent My Position*[1] Wilber describes his criticism of Whitehead as "true but partial" and writes of his own thinking as "the move from an incomplete dialogical view to an integral/quadratic formulation," as follows:

> As usual, I am not saying that is wrong; I am suggesting it is very partial. The more I studied the positive aspects of postmodernism, the more I became convinced that in addition to the immediate and monological apprehension of an object by a subject, there were types of knowing and experiencing that, although never leaving a grounding in immediate experience, were so complex and sophisticated—and involved background cultural contexts that never entered awareness as an object that was once subject—that we needed to supplement immediate empirical knowing (or even immediate conceptual knowing) with interpretive, dialogical, paradoxical, ambiguous, intersubjective awareness, an intersubjectivity that is not just a *result* of the interaction between a prehending subject and other prehending subjects, but rather forms the priorly existing space or field in which both subject and object arise, *after which*, the subject then prehends the object in Whiteheadian process terms.

The Process Model takes up Brown's microgenetic theory of cognition, arguably the greatest application of Whiteheadian process philosophy to date, and extends his model so that the cognition occasion includes the establishment of the intersubjective domain prior to the unification of the subject *qua subject* as the imputation of a central agentic self in a self-system.

The subjective self arises from an operation of unification after a series of operations progressively exteriorizing from an aspectless core. The entirety of the self-system process can be seen as a dynamic whole undergoing four undulating phases involving agency, 1) emergence, 2) withdrawal, 3) projection, 4) unification. A primary agentic drive emerges (1) and then begins to withdraw (2) through a process of layering internal-external relations such as affect, image, (object)body and (object)world; after which there is a projection (3) of primary agency into other world-occasioning bodies, constituting the intersubjective domain; only after which there is a primary unification (4) or in eastern terms "imputation" of a subjective self.

Wilber goes on to say, of the limitations of a process approach:

> I am not saying that you can't take a Whiteheadian approach and stretch it to cover strong intersubjectivity; I am saying that it is better to start with intersubjectivity and derive Whiteheadian process as a limited subset of that prior field. In other words, instead of starting with the paradigm of "I see the rock"—which is the apprehension of a Right-Hand object by a Left-Hand subject—let us *start* with a quadratic formulation—which means

---

[1] http://wilber.shambhala.com/html/misc/critics_04.cfm

SOME RIGHTS RESERVED

> that not just subjects and objects (or interiors and exteriors) go all the way down, but *all four quadrants go all the way down*.

While it is true as Wilber states, that both a strong process approach like Whitehead's and an approach that starts with quadrants or domains can derive the intersubjective, Wilber's own statement emphasizes the primacy of a structural view ("let us *start* with a quadratic formation"*)* not a process view. However, his argument as laid out above, does not pertain to the Process Model. His argument is that Whitehead's process view starts with "I see the rock," or with an UL *perspective*. To the extent that Wilber's interpretation of Whitehead's starting point is fair (and there is an entire dissertation in this one remark), then his critique of a monological starting point is true. It is monological to benchmark any one domain in deriving a theory that attempts to contextualize all of consciousness. However, it would be a mistake to make the same assumption about the Process Model. The Process Model doesn't start in the UL or the UR or the LL or the LR—it starts out at a deeper, lower, more fundamental level than the quadratic framework—in the depth and dynamics of *a process view*.

A Growing Community of Inquiry

As we welcome you to the fourth issue of *Integral Review*, we mark the beginning of IR’s third year of publishing a spectrum of academic and other works that—individually and/or taken as a whole—model integral ways of perceiving, thinking, researching, and serving the world we live in. We hope authors and readers are pleased to hear that site visits and article downloads have increased substantially and consistently, particularly over the past six months. We have focused on publishing works that can serve IR's audience as a variety of resources for being critically reflective and effective thought-leaders and change agents—and to inform, support, and challenge readers in new ways. The journey from that beginning two years ago has been rewarding, and today we find a solidly growing community of authors, readers, reviewers and editors contributing to IR’s mission.

Part of this mission has manifested in hosting a series of online dialogues to critically explore selected articles in Issue 3. Over the past four months these dialogues engaged in serious inquiry into the questions raised by the articles they focused on. We thank the authors and participants for their engagement in these forums. Both the content and the process proved to be valuable for learning, and will be the subject of a future report. As with most experiments, these initial ones produced some unexpected highlights as well as some realizations about the challenges and rewards of online dialogues that will inform our next steps.

IR has expanded with the addition of Andrew Campbell as Arts and Creativity editor. Andrew brings a depth of experience with the creative process and fine arts to IR’s editorial board. His regular contributions to the journal continue to invite reflection and exploration of what it means to engage in and be enriched by the creative process.

We are also pleased to see the launch of *AQAL: Journal of Integral Theory and Practice*. The release of four inaugural issues in the first volume has produced a large amount of material on the integral paradigm from the perspective of the AQAL model, enriching the conversation space. Congratulations to Ken Wilber, Sean Esbjorn-Hargens, Matt Rentschler and David Zeitler for their perseverance to bring this journal to fruition.

As part of our goal to foster transdisciplinary discourse and critical public dialogue, IR invites responses to and reviews of articles in a wide range of journals, including AQAL We hope this contributes to cross-fertilizing thought, research, and praxis for healthy change and development in our societies and relations.

On the Contents of Issue 4

We begin this issue with our regular contribution from Andrew Campbell. His *That Matchless Veil of Colour* weaves together insights of the creative process, art and leadership reflected in the intersection of the artistic renderings of Turner and an inquiry into notions of source. The interplay of personal notes, life events, correspondences and quotes with Andrew’s threads of text and well chosen artistic images brings a layered depth to the piece.

Sara Ross contributes a substantial review of Keith Ross’s *Knowing Me, Knowing You: An Integrated SocioPsychology Guide to Personal Fulfillment & Better Relationships.* Her review

SOME RIGHTS RESERVED

offers a quick synoptic overview of Rice's work followed by a detailed overview of the contents covered. She then goes into an appreciative and critical set of reflections and questions that covers a number of topics that highlight some of the challenges in putting together a work of the scope taken on by Rice.

Keith Rice then responds to Sara's review in a manner that reveals some of the process and context behind the development of his book, and how this process impacted the final product. He discusses the tensions between producing an academic work and something that could be utilized by a broader audience with more of a self-help orientation, as well as addressing Sara's specific concerns with the book.

I then review Bill Joiner and Stephen Joseph's book *Leadership Agility. Five Levels of Mastery for Anticipating and Initiating Change.* My appreciative overview of this book stems from years of study in the field of leadership and my ongoing search for better ways to communicate the critical distinctions that an integral approach can provide.

Next we have a descriptive case study, *Humanity, Forest Ecology, and the Future in a British Columbia Valley: A Case Study* by Stephan Martineau. I have a great appreciation for the story Stephan tells, having lived for twenty years in an adjacent valley with similar challenges. While this story is grounded in the particulars of its own time and place, it also reflects challenges faced anywhere conflicts over resources, rights and values come together in specific issues. I would like to congratulate Stephan and his group for persevering through years of dialogue across diverse interest groups to actually have achieved their first goal of being granted a community forest license.

Following this case study comes *Exploratory Perspectives for an AQAL Model of Generative Dialogue*, Olen Gunnlaugson's piece is an examination of how the AQAL model can offer deeper distinctions to the approach of generative dialogue when it is nested within it. Olen focuses on exploring how Otto Scharmer's description of generative dialogue can be augmented by running it through the filters that AQAL can provide. This produces some useful insights that await application to see how they can contribute to praxis.

Herb Koplowitz offers us a personal yet rigorous reflection on *How I Lost My Mind and Found the Meaning of "Life."* His narrative demonstrates how a moment of insight can open up a new conceptual framework. In this case, the results confront some of our deepest assumptions about life, and offer us an opening into reflecting on our own conceptual frameworks and how they can imprison us.

Transdisciplinarity: Basarab Nicolescu Talks with Russ Volckmann continues Russ' contribution of fascinating interviews that go to the core of issues central to the question of what integral thought can "look like." Nicolescu opens up profound territory in his overview of how transdisciplinarity evolved and differs from interdisciplinary and multidisciplinary approaches to scientific inquiry. Among the many fascinating discussions he goes into levels of reality and how a unity in pluralism exists in his approach.

This is appropriately followed by Zachary Stein's *Modeling the Demands of Interdisciplinarity: Toward a Framework for Evaluating Interdisciplinary Endeavors*. Stein's objective is to contribute to developing a "language of evaluation" that is comprehensive enough to critically analyze the spectrum of "disciplinarities." He examines the complexity involved in such endeavors and offers a developmental science-based taxonomy for evaluation. This is followed by looking at the validity challenges faced. We think he makes a noteworthy contribution to examining individual and group competencies for distinguishing and integrating disciplines, perspectives, and levels-of-analysis.

Finally, we have Gary Hampson's *Integral Re-views Postmodernism: The Way Out Is Through*. This extended-length article tackles the often contentious relationship between postmodernism and perspectives on what it is and does. Gary employs finesse in his theoretical, hermeneutical, and ecological rigor in this project. He offers a depth of analysis and artful choice of approaches that are instructive and illuminating. For example, his analysis challenges assumptions about Derrida and "deconstruction." His work makes a substantial contribution to clarifying this and other common perspectives that—in light of his analyses—appear to be less grounded in reality than is often supposed.

As *Integral Review* continues to pursue its mission though contributions such as the above, I hope that it attracts and inspires a growing community to engage in new thought, research, and praxis through the various forms of participation that we offer.

Sincerely,

JReams

Introduction: Sotto Voce

This essay replaces another that I created.

There is more than *a little sadness* at the events surrounding those “movements” -

They both are far too *complex* to now *lie* before you, the reader.

I quietly go about, re-binding what was broken.

[In a short series of exchanges with an editorial colleague Russ Volckmann, I closed a small collection of “pieces” I’d made for him out of fragments as one, with the following lines, “He asked me what I did, I told him, *I am in the resurrection business.* He blinked and turned away.” It is now open for anyone with inter-*est* to ask Russ how that document, that ended thus, affected him and the *strange reality* that came about shortly after the exchange, concerning the “resurrection” of a friend, Mnr. A.M. de Lange, very shortly after he had apparently *“died” to a community of minds.* Russ may send a “copy” of that document directly, having my *per*-mission, so that “you” can discover how it affects you, *in your turn*.]

What substantially follows begins with some “words” about a river and “Source.” They open Gunnlaugson’s article (in this issue).

Then there are included some ideas of that author’s colleague - set down in small part, so as to make the connections. Again - you will recognise them, from a distance.

(Dear reader, literally as I type the sun rises in my eye - at 6.07 am --)

I am found joining some abiding ideas about “source,” “art,” “leadership,” etc., and it really focuses on a private exchange between Joe Jaworski and I. For that reason alone I have “altered” the private notes a little bit, as we exchanged, because I am deliberately and self consciously assuming I have his *gracious permission* to *draw on his work* as he is mine without expressly asking him for it, rather relying (falling) into the *minor graces* of our shared experiences and expeditions into the sp(l)aces of source and Source, as he falls occasionally and gracefully into mine. So, please accept there are a few changes in our exchanges to the original, for reasons of respect and friendship.

Running alongside this essay’s “main line” is another “branch line” offering a *train of thoughts* which I would like to just mention. It’s an idea from John Seeley Brown at Xerox Parc, concerning “Documents,” which can be described in the same way as imagery, as they also are a powerful *resource* for constructing and negotiating any broadly “social space.”

> The idea of a document as a carrier is a "conduit" metaphor. People talking of information as being "in" books, files, or databases as if it could just as easily be "out" of them and ideas are "down on paper," to "send them along," and so forth. While that captures some aspects it simultaneously hides others (Brown & Duguid, 1995).

The first “opening” image is one that an anonymous (artist) person made during a workshop I led on the topic *Synchronicity* in 2002. It was then incorporated into a suite for Jaworski’s interview with Scharmer. When Joseph saw them in his office he was very happy - and we have been in contact at various times ever since. We share many common inter-ests. This “document” makes reference only to the letter of a few weeks ago which ties in with “local” events at both ends and also an ongoing discourse of light and trees. The work of Rosch is also there, as she has an intuitive feeling for the extremely subtle power of art in this realm.

> **The ultimate source of the Susqehanna River was a kind of meadow in which nothing happened: no cattle, no mysteriously gushing water, merely the slow accumulation of moisture from many unseen sources, the gathering of dew, so to speak, the beginning, the unspectacular congregation of nothingness, the origin of purpose. And where the moisture stood, sharp rays of bright sunlight were reflected back until the whole area seemed golden, and hallowed, as if here Life itself were beginning** (Michener, as quoted in Gunnlaugson, 2007).

Dear Andrew:

Thank you so much for your note of March 26 (2007). I am so distressed that the wood from the heart of the yew has never arrived here at my house. I'm asking ‘P’ to check in and work with you to determine what has happened. I feel badly that you have done so much to get this to me, and for some reason it's never arriving.

On the subject of Source -- this is still at the center of my attention. I'm doing a lot of work in large systems, including organizational systems. I'm looking for the best way to describe Source and the experience of connecting to Source.

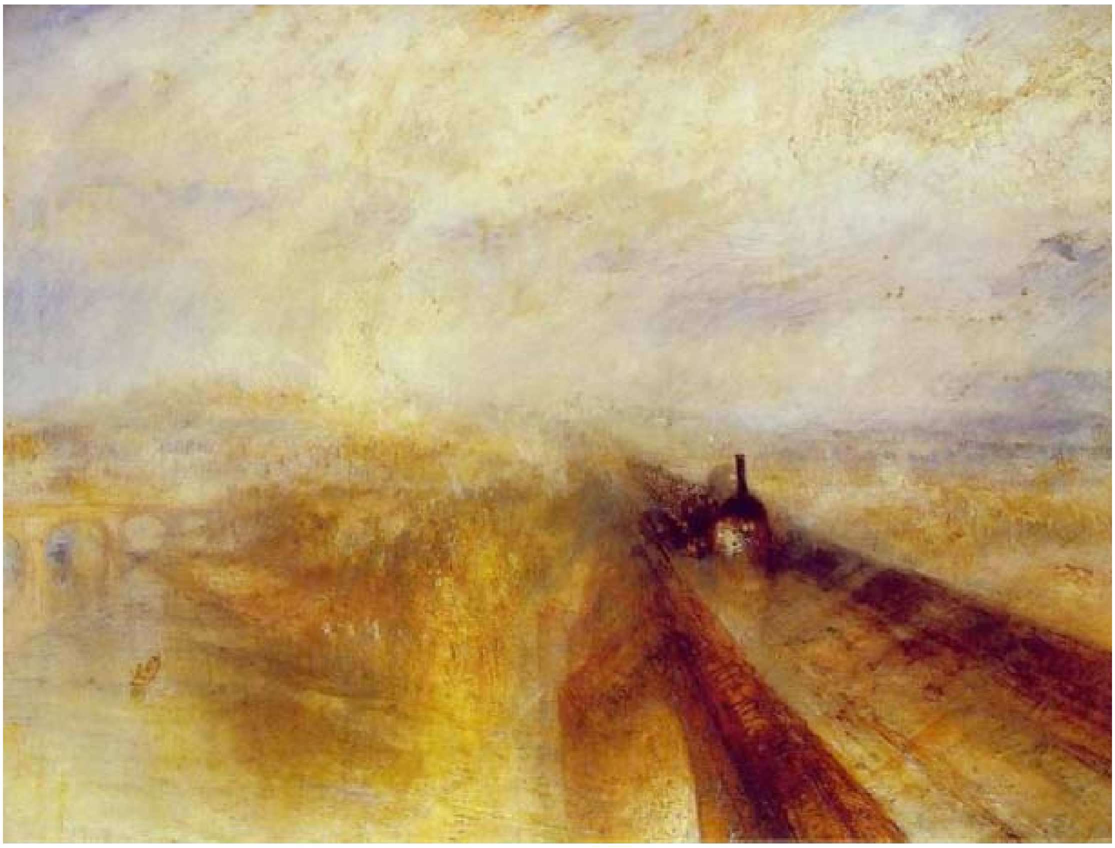
Thank you so much for reminding me of Otto's interview with Eleanor Rosch. I have read a number of Rosch's essays, and I must tell you I agree one hundred percent with you: I have always felt very, very connected to what she is saying. The very first time Otto mentioned her to me, I went and read one of the essays he mentioned and felt it was awesome. I was completely struck by it. She really gets it, and knows how to describe it.

So I can't thank you enough for laying out Rosch's words in your email. I have reread them and will actually use them this week. If you know anything specifically she has written on this, let me know; otherwise, I will just go to the papers that I have and reread them.

Also, thank you so much for your mentioning Van Gogh's Chair. I was deeply touched by what you said there. I completely understand. I completely see.
Thank you.

Love,
Joseph

The Reply



Rain, Steam and Speed - the Great Western Railway, 1844 J.M.W. Turner

Books are not absolutely dead things,
but do contain a potency of life in them to be as active
as that soul whose progeny they are
John Milton, *Areopagitica*

[Dear Joseph]

This week I accompanied to Tate Britain a friend, he happens to have recently been elected a Professor in a Scandinavian university, teaching among other subjects ‘leadership.’ It was the first time he’d experienced historically significant international works of art in a capital City setting.

He/we found among many competent but dull impressions of life and landscape, two small and intense JMW Turner paintings, like the one above. [And from the same late ‘period.’]

As he stood among *all* the paintings he realised that the two Turner images contained the seeds of a deepening, even awakening appreciation, of what we might now describe as, ‘how we find the grace to lead’ - which, reflecting now, may be acts of both an ‘opening’ and a ‘falling.’ And he and I supposed that we do not ‘find grace’ we can only ‘fall into it.’ This is a very different path to the ‘strivings’ of up-hill and down again, characteristic of Sisyphus.

You wrote that you continue to search for “…the best way to describe Source and the experience of connecting to Source.” So, I presuppose to make a connection in that general direction.

> Amongst these (paintings) is a pair which he exhibited in 1826 and 1827. The subject or motif that appealed to Turner: the lawn of a house overlooking the Thames near his riverside home in Twickenham. The theme of the first to be exhibited was early morning, and the view is directed towards the sun which is throwing long shadows across the lawns, on which - the moisture is drying. But then when he came to paint the house in the glow of summer’s evening for the next year’s exhibition he did not, as a later generation of artists would have done, paint from the same angle. He turned his easel round, characteristically once again facing into the sun. (Reynolds, 1969). [Note: This pair is not the pair referred to as earlier viewed in the Tate Britain.]

It will be good, Joseph, if you can print this little image onto some white paper, and keep it with you for a while.

You will maybe see that the image contains effectively two main forces of travel for direction, one is nature’s own and the other is mechanical. - Out from the *field of light* comes the train, the new ‘messenger’ - the [Black] Angel of the 19th century, and way below that hurtling and manifest ‘dark object’ is the river, and upon it a tiny boat. To your left, as you look at the image is ‘upstream’ and to your right is ‘downstream.’ The river is the Thames - a source of inspiration to both Turner and Will’m Blake, alike.

We might reflect how like the train we can become, when we ‘manifest too much’ our ‘intent’ to go upstream and/or even downstream in search of ‘Source.’

Perhaps there is in this imagery, as in nature, an ‘other’ less ‘manifest,’ nearly ‘invisible’ means of ‘carrying meaning’?

This painting fits the description of many others he made, ‘- of nothing and very like.’ [Hazlitt 1816 in Graham Reynolds, Turner, Thames and Hudson, 1969]

I ruminate on the idea that source and its latent capacity is not anything more or less than what Turner ‘placed’ in *his* ‘frames’…

> He directed his interest toward the colour in the visible world, if needs be at the expense of its form. His always present fascination for the immaterial vehicles of colours, steam, smoke, mist helped him to make this choice. So, even in the later ‘finished’ pictures he composes in colour, dissolving, suggesting, and only half defining form… Graham Reynolds, Turner, Thames and Hudson, 1969.

In this way, it seems possible that ‘we’ the viewer and ‘now’ some hundreds of years later, may palpably discern that it is not the ‘elements’ of the picture surface as such that create the vision within us; it is rather that we are ‘opened’ by these creations, and this picture called ‘Rain, Steam and Speed’ there is this - a *case in point*.

It affords us just enough ‘information’ to enter into a new space within it and (our)self, *with-in-held* but undisguised *set- all- about* in its ‘bright shells’ of sfumato[1] and *apparently-lighted-chaos …*

So by degrees it offers the opportunity to become a creator cum artist too - we may continually ‘co-create’ the object anew, as Milton saw of the written object, at every viewing, and that *secures* the subject, which is the point at which we might see how we are ‘like’ the stone bridge, standing in the river in the sky within the air supporting the train both being and not being, thus.

> Finally, with Presencing, my experience is consistent with Wilber’s speculation that “presencing” evokes the “causal state” in as much as Presencing calls upon the spacious and vast causal Bodymind. Here participants begin to experientially make contact with the threshold of emergence, which gives rise to manifest thoughts, ideas, and intuitions that begin to crystallize in our awareness (Scharmer, Dialogonleadership.org, 2004).

This is perhaps an aspect about this particular painting, I mean its way of conveying ‘information’ and potential for ‘meaning’ and scope too for increasing our ‘capacity’?

Turner affords us just enough ‘spaciousness’ for a slip(ping glimpse) or a fall into a *aesthetic kind of grace*, a new understanding of how we manifest ‘awareness,’ bringing, as Senge says it somewhere, *the background for a moment into the foreground* or perhaps as Michelangelo wrote it, “How else am I to ascend to heaven except through the contemplation of beautiful things.”

This then becomes spoken and written as, *awareness-manifesting-us*. In a very literal way, the image has a ‘ground’ and in that ‘ground’ we may project an element of a deeper intent.

We have the opportunity (there is an affordance) to become alive, to live in(to), the image, so increasing our real participation in its own ‘wholeness.’ This is a ‘whole bridge’ between past, present and future - being and becoming, liveness.

In the context of your questions I will quote below from an upcoming paper written with the afore mentioned academic colleague, which is in a large part about ‘wholeness.’

> …In the context of the impressions, images, concepts, feelings and memories that the first iteration has evoked. Simply note what arises, as it is all aspects of ever-present-wholeness. Allow all that arises to flow effortlessly through the stream of awareness, as they require no work on your part. There is no need, indeed no possibility to “figure it out,” or have it all fall into place within some epistemological order” (Reams & Roy, 2007).

---

[1] Sfumato is the Italian term for a painting technique which overlays translucent layers of colour to create perceptions of depth, volume and form. en.wikipedia.org/wiki/**Sfumato**

Which passage I think fits and evokes this painting’s largest inner purpose. As does this, some time later in the same paper,

> “Who I am” reflects an ever-present-wholeness in that it is not about “realms beyond” or “something new,” but rather about a transformation of view. There is no way to point to a casual explanation for the occurrence of these views in any traditional sense. For both Starratt and Saunders, the events leading to these extraordinary states of grace, and the very “things” that played their parts, were themselves quite ordinary – a boy, a barn, a fence and its posts; a carnation, sky and ice, a scarf and a pony. For both Starratt and Saunders, the ordinary became extraordinary, because their way of seeing was transformed. Their way of seeing had to become whole for the wholeness that is ever-present to reveal itself in the normal and natural; for the place of grace, that “secret place,” is “where we have always been,” in the normal and the natural. We just need a new way of peering into the normal and the natural. We need a new kind of view (Reams & Roy, 2007).

This sense of a surrendering to involvement of an aesthetic experience of wholeness is echoed in a passage from Turner’s life, in an epic painting with an equally epic title: *Snowstorm - steam-boat off a harbour’s mouth making signals on shallow wate*r*, and going by the lead* has the impact of total immediacy about it. The title continues: *the author was in this storm on the night the Ariel left Harwich* and he was mightily indignant that someone told him that his mother had been through a similar experience and understood what he was getting at. He said,

> I did not paint it to be *understood*, but I wished to show what a scene was like: I got the sailors to lash me to the mast to observe it; I was lashed for four hours, and I did not expect to escape, but felt bound to record it, if I did. But no one had any right to *like* the picture (Reynolds, 1969).

What I read and understand here, now, is that the image *Rain, Steam and Speed* reproduced above is a special “space,” a space of both doing and knowing in some important relational measure, some “Golden proportion” that requires some (in)action of the spectator—that both may bring each other forth, as the one reveals itself to the other, and that other to another is a potentially endless series of recursions, so that we no longer know if the source that is secured in and of this vision is in the viewer or in the object of his or her view or both.

There is a thought or saying; that the thoughts of a genuine mystic can become so intense that they may become actual physical form. Whether they become living form is another thing.

Seeley Brown’s (1995) thinking is re-inserted here to the original document for Joseph, now partially surrounding us,

> New technologies take us through major transformations in the way we use ‘documents.’ We need to see the way ‘documents’ have served not simply to write, but also to ***underwrite*** social interactions; not simply to communicate, but also to coordinate social practices. In particular, new media like the Internet has allowed small or emerging communities to form, though their members were often few, and those few spread over large distances. Consequently, as never before, scattered groups of people unknown to one another, rarely living in contiguous areas, and sometimes never seeing another member, have nonetheless been able to form robust social worlds, some disintegrate; some of those

> might all along have been more imaginary than either real or virtual. Anderson calls the resulting community an "imagined" one. This is no slight. An imagined community is quite distinct from an imaginary community. It is one whose members "will never know most of their fellow members, meet them, or even hear of them, yet in the minds of each exists *the image of their communion* (Brown & Duguid, 1995).

My “thought” is that should a Source become such a form, a living thing, it would manifest itself as eternally recurrent cycling, like a field of grass in the morning, bending and swaying in a breeze - wherein light and water may rise and fall, rise and fall, rise and fall.

A vision: of the single raindrop standing still in the tumult of the storm that we are and at the center of all attention.

“We just need a new way of peering into the normal and the natural. We need a new kind of view.”

> *The ultimate source of the Susqehanna River was a kind of meadow in which nothing happened: no cattle, no mysteriously gushing water, merely the slow accumulation of moisture from many unseen sources, the gathering of dew, so to speak, the beginning, the unspectacular congregation of nothingness, the origin of purpose. And where the moisture stood, sharp rays of bright sunlight were reflected back until the whole area seemed golden, and hallowed, as if here Life itself were beginning.* -- Michener

For Joseph,
Love,

Andrew Campbell: May 2007

Endnotes --

London can be a cold and grey City and the Thames itself can be, at one end, like the Susqehanna River and at the other a sewer - and such a grey muddy creature was the *old father* when we saw those Turners.

My corporeal companion on that cold and wet day a few weeks ago was in the *company* of many more than he knew - or may ever now know.

A friend of Turner’s near the end of his life asked him where he was spending most of his time and Turner replied, “You must not ask me.”

In Cheyne Walk, not far from us as we walked down to Millbank, there lay, quite still now, a small, fragile and yet ferocious (Spirit)(man) -- who carried within himself the endlessly rolling tear in the endlessly rolling storm of Nature’s Creationing -- Which man would wrest from God by twisting his arm? (Self and Mnr. AM de Lange, Private conversation, late May - Post Resurrection ;-)

> The doctor who was present at his death, on 19th December 1852 wrote, “Just before 9.00 am the sun burst forth and shone directly on him with a brilliancy which he loved to gaze on. He died without a groan.... (Reynolds, 1969).

(Dear reader, the sun has just retreated, it is 07.20 am)

All of you

Older than you know:

> I once made a copy of a Michelangelo ink drawing of his great female 'love' Vitoria Colonna.in 1976 at the Ashmolean Museum, Oxford. I made it on a green handmade paper and underneath I set by my hand in red ink, by a typographic method what he had exclaimed in writing a *document,*
>
> "Vorrei voler, Signor, quel chio no voglio,
> Tra 'l foco e 'l cor ghiaccio un vel asconde,
> Che ' l foco ammerza ; onde non correspone
> La penna all'opra, e fa burgiardo 'l foglio..."
>
> I would will, My Lord, what I do not will.
> Between the fire and the ice cold heart a veil is interposed,
> which the fire absorbs; meanwhile what I write
> does not correspond to what I do, and makes a lie of this page...

It is for you all now to find *the source* of that.

Dear reader, **I am finished**, it is 08.26 am.

...An Angel once imparted to me that “art” is to know the right part and measure of any disclosure of what is otherwise hidden, and when to disclose it. So, it is both about time and space. Turner’s titles were “epic.” and were essays or disclosure in themselves; he will teach you much—even in this tiny reproduction. When you see-saw ;-) this Turner, in all its yellow, and the yellowness of the Jaworski image you will be moved and surprised. Why? Because these are the signs of true and deep emergences at the edges of what At calls “the ragged rising vortex.”

I dedicate this to all small children

Book Review

Knowing Me, Knowing You: An Integrated SocioPsychology Guide to Personal Fulfillment & Better Relationships.

Keith E. Rice. 2006. Victoria, BC: Trafford.

Reviewed by Sara Ross

Keith Rice's book offers 337 pages packed with information and opportunities for reflection. The premise of the work is that "by aligning and integrating previously uncoordinated works of reliable science, [it] provides the means to understand the causes of personal and interpersonal problems." From the understanding so gained, the reader "can then determine the best means of dealing with the issues." Following from that, the purpose of the book is to help readers (a) understand why they and others are the way they are, (b) surmise what they might be able to do if they do not like things the way they are, and (c) develop strategies to have more fulfilling life experiences and relationships.

Rice has ambitious expectations for the reception, perceptions, and outcomes of his first book. Asserting that "This book will change Your Life!!!!" (p. 1), he aims to enable the reader to "have a greater appreciation of the sheer diversity in both your own thoughts and motivations and those of others with whom you have relationships" (p. 5) and aims to "align and integrate the behavioural sciences" (p. 5). He begins with stating his intent to provide an "overarching 'approach' – a *meta-approach,* if you will – to incorporate and align all the other 'approaches'" and use "all the elements of the behavioural sciences and complementary hard sciences" to explain psychology and "group dynamics and the influence of cultures and the societies people live in" (p. 2). A concluding claim is "with the information provided in this book, there can be no more excuses for repeated failures. Now, we must hone our understanding to be ever more precise in the design of our interventions, strategies, and therapies" (pp. 336-337). This review sketches how he executes his agenda, and offers both appreciative and critical reflections on it.

Reporting on the Book

Fittingly, the first of the book's two parts—*Knowing Me*—is dedicated to taking the reader on an exploration of self and the "selves" of the self. The second part—*Knowing You*—covers a range of topics from conflict, to gender, to relationships of the romantic, the parent-child, and the workplace. Each part closes with a section on "troubleshooting."

The first two sections of *Knowing Me* aim to disrupt readers' assumptions about the nature of the "self" and its changeability. Rice introduces Susan Blackmore's concept of "selfplex" as a confluence of memes, and reports her contention that beyond existing as biological machines, what people perceive as "self" is a "mind of physiologically-embedded concepts" (p. 17). With the introduction of the meaning of *memes* as ideas or concepts that individuals consolidate into various schemas that shape their behaviors and beliefs, Rice invites readers to make choices about discarding the schemas that have undesirable roles in their lives.

SOME RIGHTS RESERVED

Next, Rice introduces the ideas of temperament and personality, using an axis to represent Jung's introversion-extroversion spectrum, then Eysenck's addition of two more axes: one to indicate the stable-unstable spectrum and another, the spectrum of impulse control-psychoticism. Sprinkled in for additional context, Rice includes a few mentions of biological research related to various dimensions of temperament. He provides Eysenck's Personality MiniTest, a fill-in questionnaire for readers' self assessment. Rice offers readers the following advice as the section closes: despite what you may hear from others, there are some aspects of temperament that cannot be "fixed." Readers are encouraged in this section, and others, to internalize that there are some physiological bases of human behavior and a quality of *more or less-ness* with some kinds of individual change, e.g., basic temperament.

The next four sections introduce readers to Self as Identity and identity's place in Robert Dilt's "neurological levels" lineup. Dilts' framework is referred to in various parts of the book to unify dimensions Rice introduces. From environment at its base, the sequence goes to behavior, then skills and knowledge, then values and beliefs, then to identity. Spirituality is at the apex and Rice periodically brings spirituality into the discussion to explain to readers why he does not include spirituality in his overall work. From Dilts, Rice introduces Graves' work popularized as Spiral Dynamics, using much the same kind of language as Beck and Cowan's book, *Spiral Dynamics*. He offers a table for the theoretically inclined, which compares Graves/Spiral Dynamics levels with other stage theories. Another table illustrates how the Graves/Spiral Dynamics levels "sound" in adult thinking about domains of work, home, personal relationship, children, friends, and community.

Five more sections in Part One develop the concept of life conditions' interactions with identity and values/beliefs, the role of memetics, and dynamics of change, including the Spiral Dynamics *gamma trap*. In applying Graves' core concept of life conditions, Rice highlights the concept's dynamism by relating it to Bandura's concept of *reciprocal determinism*. Rice's effort can aid those who want to learn how to think about interactive dynamics of behaviors and social and other environmental constraints. The idea of the multiple "selves" and vMemes (schema in the larger culture) represented by Spiral Dynamics levels is used to introduce origins and nature of memetic conflict. Along the way, Rice brings back into the equation more discussion of temperaments and spectrums and their relation to memetic considerations and more on psychopathology.

By the 13th section, Rice has foundations laid sufficiently to take readers through several models to integrate psycho-logics involved in self-talk, or "Meta-Stating." Such self-talk is a gestalt of confluent factors. They may include the schema with which a person operates, whether a temperamental disposition, psychopathology, environmental interactions and/or circumstances lead a person to attribute causation to self-doing or "out there," and the perennial role of vMemetic factors.

Part One closes with Rice's troubleshooting advice for understanding and coping with stress and related movements across the spectrums he introduced throughout the journey. His *13 Tips for Your Psychological Health* summarize key points in Part One.

Rice introduces Part Two by citing its emphasis on the dynamics in relationships and "how you can influence those who impact upon your Life Conditions," with an acknowledgement that "where you can most influence others is in the Life Conditions their vMEMES will interact with" (p. 193, emphasis in the original). To span its terrain, Part Two introduces additional models, some from Neuro-Linguistic Programming (NLP), some for self-assessments, and some to integrate additional insights from brain research. It, too, dedicates many pages to introducing

Spiral Dynamics' offerings for understanding conflicts, including translating Maslow's hierarchy of needs as the outcomes desired by memetic activity. Along the way, as in Part One, psychological theory is sprinkled in discussions (e.g, Eyesenck's work, Reactive Attachment Disorder).

After its introductory sections, Part Two applies and adds to the concepts introduced throughout the book to discuss gender issues including biological influences, man-woman relationship issues, and child-parent, school, and workplace relationships. These sections are largely constructed with Spiral Dynamics interpretations and recommendations for interactions with others. The Part Two "troubleshooting" finale includes *21 Tips for Managing Relationship Disharmony* which like its Part One counterpart is a summary of key points and advice from Part Two.

Rice's conclusion expresses the hope that as a reader worked through the book's "extensive body of knowledge" that s/he will have "calibrated yourself, others you interact with and the relationships you have with them" (p. 335). On the assumption that clinical psychologists, psychiatrists, and therapists of many kinds will be among his readership, he delivers stern advice:

> You work with some of the most vulnerable people in society but many of the assumptions about human nature your disciplines have worked with in the past are revealed now to be flawed. Please – *please!* – use the knowledge and understanding provided through *Integrated SocioPsychology* to apply your skills and expertise with greater precision (p. 337).

To readers at large, he advises: "you now have great knowledge: use it wisely to make a positive difference both for yourselves and for others" (p. 337).

Keith Rice has high expectations for the impacts of this book upon his readers and how they will employ them. He has supplied a concentrated span of Spiral Dynamics applications, in book form, to a practical range of domains of life domains. He has integrated those dynamics with other psycho-logics to help readers have a fuller understanding of how they and others behave. He includes a page of web-based resources for readers to pursue referenced work in more depth.

Appreciative and Critical Reflections, and Questions

There is much in this book to appreciate from various perspectives. Rice attempts to supply a reader with enough information and examples to begin to understand himself or herself as a dynamic system; a system of different personality tendencies and "selves" or value systems; a system rooted in biological, neurological, and life-conditioned "hard wiring" and variances. For readers who notice these dynamics going on within them, there is a further benefit. Rice's discussions and examples in Part Two pave the way to internalize how systems interact. Taken as a whole, the book could help people develop metasystematic understandings in at least interpersonal domains. These would be worthwhile developmental contributions.

At the same time, it seems that Rice may assume that reading about others' models and selected scientific facts are essential paths to self-knowledge. For some or many readers, such "out there" tidbits may not serve the quest for "in here" knowledge of self (or others). Yet, for those who track with Rice's presentation, this book could help them understand a human being as a system in which many shifting and interactive dimensions are active. Such understanding could support *experiencing* one's own existence as a system. Such experience precedes capacities to notice, reflect on, and begin to make sense of self-complexity. A book that performs such a service deserves praise. His examples may help readers begin to understand “self as system,” a vital part of the journey to multi-perspectival living.

I believe Rice provides a useful introduction to Clare Graves’ conception of value systems and how they show up in relation to life conditions. The presentation seems likely to enable readers to recognize that neither they nor any human being “is” a value system. This means Rice’s readers may be unlikely to label people (as in, “she’s Blue,” “he’s Orange,” “they’re Green”) based on levels of the colorful spiral that is used in popular versions of Graves’ work.

Another service performed by some of the examples is bringing to life the Gravesian concept of interacting with “life conditions,” by applying the concept, not just referring to it. He provides many examples that bring the concept to life, in real-life interactions. It is worth iterating the point made earlier: Rice’s effort can aid those who want to learn how to think about interactive dynamics of behaviors and social and other environmental constraints. Without such thinking, as is often reflected when people talk “in colors,” Graves’ genius in understanding the complex evolution of human behaviors can remain untapped, and Spiral Dynamics-related applications can be shallow, if not harmful.

The positive services performed by Rice’s book seem to be accompanied by some biases, contradictions, confusions, and incomplete efforts to accomplish the aimed-for integration. Some of these are theoretical issues, some of these are developmental issues, and some are a combination of the two. Some are issues that could impact readers and/or their associates in unhelpful ways. These latter are results of the former, and it seems important to mention them here and to raise larger questions that they may imply.

Heterosexual Bias

Alongside its aim to have biology and neuroscience help to integrate the psychological and the social, the book reflects a curious, unnecessary, and unnecessarily consistent, heterosexual bias. Rice does not anywhere in his examination of relationship issues acknowledge or address homosexual relationships. Such a bias is particularly striking, given the sciences the work draws from. This is not raised here as an issue of political correctness. Rather, I suggest the issue is one of (a) putting balanced science at the service of readers and (b) advocating for integral awareness of multiple perspectives and life experiences without blindness to their existence. The failure to acknowledge non-heterosexual experience anywhere in this book while presuming heterosexuality throughout it gives this reader the impression of an implicit bias in the author. *How might integrating perspective-taking with knowledge from the soft and hard sciences help to transform such biases where they exist?*

Other People as Objects

Despite its aim to support better relationships, periodically the book takes an approach that treats other human beings as objects. Such stances are unlikely to support healthy relationship-building. For example: “So now you know what you want from your relationships, how do you tell the other person(s)? . . . [The other person may have] a different vMEMETIC set-up than the memes we’re attempting to infect them with” (p. 219). When I am in a relationship, I tell my partner what I want in our relationship and he does likewise. Such sharings are essential reciprocal exchanges that inform our co-creative efforts to build the relationship and mutual understanding. They would run aground rapidly if either of us were trying to “infect” the other with wanting what we want the other to want. *How might we live into an integral notion of the Golden Rule where relationships are* co-constructed with *others, not* done to *others?*

Simplism of "Infection"

As the foregoing quotation suggests and evident in the book's discussions of them, the concepts of memes and v-memes can be conducive to mechanistic, reductionistic, and/or atomistic applications. These concepts can make the dimensions underlying complex personal, interpersonal, and socio-cultural dynamics seem like "things" that we can label, see, and manipulate. That is not the case. After all, if it were that easy to change such dynamics by infecting others with "things" like memes to make them change, our relationships—and the world—could be free of misunderstandings and conflict already! Mindsets behind such approaches can support manipulating objects, but humans are not objects. The concepts can quickly obliterate the dynamic reciprocal interactions (and their role in development) that Graves' original work illuminated and that Rice promotes. *What might the study and application of Graves' work accomplish (and how might it support integration more generally) if Beck & Cowan's insertion of memetics were detached from it?*

Confusion About Human Development

The book reflects some confusion about human development—what it *means* that Gravesian systems "emerge in symbiotic interaction with the Life Conditions in the Environment" (p. 189). As the excerpts below indicate, this could be like a roller coaster of contradictions for some readers. It could lead to harmful expectations of self and others. The confusion mirrors much of the Spiral Dynamics-related discourse when some say "the entire Spiral is already within" and some say its double-helix dynamics are about persons' gradually maturing development (levels of existence) depending on their contexts (life conditions). Rice adds to the confusion with his interpretation of Beck's "various postings" to the Spiral Dynamics-integral list serve: "Beck . . . does imply that there is a maturational factor in the emergence of vMEMES. He has not said explicitly that vMEMES are programmed to emerge in sequence as someone develops through life, irrespective of the Life Conditions; but the implications are inescapable" (p. 189). His subsequent sorting effort does not resolve the confusions. *How might a community of the interested reach a point of committing to a sustained inquiry where such confusions are unpacked, understood, coordinated, and growth-full to resolve?* Confusing contradictions about the nature of human development run through such examples as the following.

> If the Life Conditions predicate ORANGE thinking, then don't be surprised if there's not much TURQUOISE around (p. 99). As indicated by the assignation of Kohlberg's [stage] 4.5 to Erikson's *Peer Relationships* stage, we would hope that ORANGE would be starting to emerge in the thinking of most young people by their mid-teens. Realistically we know that this is far from being the case. However, that doesn't mean you won't find ORANGE and vMEMES beyond in a secondary school classroom. The reality is that we could take a class of middling ability 15-year-olds and discover all the vMEMES were active – even YELLOW, possibly even TURQUOISE (p. 312)!

> Don't beat your head against a brick wall trying to get someone to become something they can't be or are not ready to be. For example, it's completely unreasonable to expect GREEN thinking from somebody who's never climbed the Spiral beyond RED (p. 329).
>
> Sometimes 2nd Order Revolution can be so powerful it appears we can go up the Spiral by two or more vMEMES almost instantaneously. This is termed 'Quantum Leap' (p. 121). As discussed in Chapter 9, transitions between vMEMES can be near instantaneous. However, in many instances the process can take some considerable time.... (p. 150).
>
> So, the BIG QUESTION: can you self-actualise to YELLOW thinking – or are you trapped in 1st Tier worldviews (p. 97)? If you're not happy with the way things are, can you go meta – self-actualise from YELLOW thinking – to look beyond your own reactions to the Life Conditions (p. 106)? Of course, if you have 2nd Tier vMEMES activated in your psyche, then temperament may not be much of an issue, anyway (p. 139)!

Rice does not tell his readers how he defines the universe of the behavioural sciences. He certainly mentions a number of "elements of the behavioural sciences," but certainly not the "all" that he claims. His grandiose claims sprinkled throughout the book may challenge readers' patience if they are not taken as true. Nonetheless, the work does indicate that he is making valuable connections among models and premises. For readers who can take it all in, his correlation of multiple models could lead to integrated insights about human functioning.

Conclusion

Despite the weaknesses noted here, I believe the book has noteworthy potential benefits to its readers. Some pearls of great price in the book include the discussions and illustrations of systems of relations, e.g., the feedback loops of particular individual behaviors on another, the roles of environment and structure, and the multiple "selves" within one human being. These and other points that Rice makes could enrich ongoing dialogue in a community of the interested. That, in turn, could support and inform Rice's noble efforts. It would support his plea that we must not go on repeating our failures in relationships, politics, law enforcement, business, education, and armed forces' commands. Perhaps it would even encourage more widespread efforts to build and integrate knowledge—of self, of others, and of the social worlds we co-construct and share.

A Reply to Ross

Keith E. Rice

Well, I had to start somewhere…! My Response to Ross

Sara Ross' review is a pretty fair summation of *Knowing Me, Knowing You*.

For all its lofty ambitions and grandiose aims, it is a flawed book. And the principal flaw lies more or less in its genesis.

I set out to outline a structure for what I conceive as *Integrated SocioPsychology* – the aligning and integration of all the different (and differing!) fields in the behavioural sciences. It was a culmination of some eight years' work of mapping various fields in Psychology initially to the Graves Model (popularised as *Spiral Dynamics*) and how that played out through Robert Dilts' *Neurological Levels* and influenced the process of meta-stating (as modelled by Michael Hall). Later, when I came (via my work as a part-time therapist) to deal with biologically-influenced temperament, I used Hans Eysenck's *Dimensions of Temperament* to describe those factors and found, via the work of William Moulton Marston, that they could be linked to certain of the vMEMES *Spiral Dynamics* talks about.

It was intended to be a serious scientific work, capable of standing up to the most rigorous academic scrutiny. Thus, because the social sciences are messy – one of the principal reasons for derision from the "hard science" people! – I was cautious in my presuppositions and assumptions, careful to delineate between validated theory and postulation on my part and I referenced as much as I could. (Hence, the large number of footnotes!) On that basis it was necessarily reductionistic. Spirituality was sidelined to avoid distraction from the focus on what could pass as "scientific."

What became *Knowing Me, Knowing You* was to be a beginning of sorts, a step in the process of developing *Integrated SocioPsychology*. A process to which I hoped others would contribute. Thus, I took the decision not to trademark 'Integrated SocioPsychology' and gave an open invitation on www.integratedsociopsychology.net for interested parties to submit articles, case studies, etc, which would fit broadly within the concept.

From an academic work to a self-help book?

Somewhere along the way I was persuaded to frame it as a self-help book on the grounds that it would widen its commercial appeal considerably.

So large parts of the book were rewritten and a self-help frame imposed on the structure. Much more anecdotal and case study material was introduced and some tools for designing therapeutic strategies were provided.

This partial change in direction created a fundamental flaw which resulted in the elements of confusion Sara describes in her review.

The flaw lies in the dichotomy between given certainties – which I have to provide as a therapist – and the mess of uncertainties – which I have to explore in my other role as a teacher

SOME RIGHTS RESERVED

of academic Psychology. People coming to me for counselling & therapy want “answers” – certainties which will indeed change their lives. They don’t want to know that Freud thought this, Graves concluded that, Don Beck hinted at the other, Aaron Beck wouldn’t hear of it and maybe, just maybe, the resolution might lie in the work of Kohlberg. (Oh, and by the way, Blackmore’s convinced “soul” is just a memeplex but Wilber’s got a lot of structure in his circumstantial evidence for the affect of “spirit”!)

Thus, *Knowing Me, Knowing You* is fundamentally flawed in its dichotomy between offering self-help certainties and its efforts to resolve a broad-based theoretical approach centred on linking Graves-Eysenk-Dilts.

Initial reaction was mixed, to say the least. Many of the “self-helpers” who tried it found it way too scientific. While I’ve found academics (by and large!) are far too “important” to be seen offering serious consideration to a mere “self-help” book. For a while, I determined to abandon *Knowing Me, Knowing You* and demerge its dichotomy into a “real” self-help book, shorn of most of the science, and a university level text book.

That will still happen – along with a manual for therapists – but more recently I’ve found there is a niche of readership for whom *Knowing Me, Knowing You* really works. They’re high cognitive processors capable of dealing with paradox and uncertainty – arguably 2nd Tier thinkers! – but who either want to address issues in their own lives or want to understand/help others with issues in their lives.

Consequently, I’m still promoting the book and will return to it in perhaps five-six years’ time to update it. There are a number of assertions in it which are made very tentatively indeed, for fear of falling foul of the academic process. I hope that by the time I come to revise it, I’ll have the evidence to make those assertions in a much stronger manner.

1st Tier thinking, 2nd Tier thinking and biases

One area which should be addressed in a revision would be the so-called “gay issue.”. As Sara rightly points out, there is a heterosexual bias throughout *Knowing Me, Knowing You*.

Why? Well, until Sara kindly sent me a preview of her review, it simply hadn’t occurred to me! How ever much homosexuality is no longer considered abnormal by most definitions of “psychological abnormality.” with most recent surveys (e.g., Australia/Canada/USA, all 2003) indicating the number of openly-practicing gay men and lesbians to be very substantially less than the mythical Kinsey figure of 10% of the general population (i.e., between approximately 0.5% and 5%) it is still abnormal statistically. So I’ll excuse my ignorance on the grounds that its relevance didn’t occur to me.

However, for that small figure, for the probably much larger figure of people who try it and abandon it or only engage that way occasionally or are that way in their orientation but don’t come “out” openly, and for the very much larger number of people (friends, family, work colleagues, etc.) who are affected by such orientations in sexuality, it undoubtedly is highly relevant. And Sara is right that a book which purports to change the way we view ourselves and our relationships should take homosexuality into account.

Besides which it would be fascinating to map the work of Letitia Anne Peplau, Celia Kitzinger and other groundbreaking researchers into gay and lesbian relationships into the structure of motivation and relationship dynamics which *Integrated SocioPsychology* explores.

One possible "jumping-off" point for such an exploration might be p. 259 where "maleness" and "femaleness" – Jung's *animus* and *anima* – are considered as poles on a sliding scale rather than biologically-determined absolutes.

Another of Sara's criticisms I take to heart – but possibly not in the way she intends! – is the one of objectification of the other person(s) in a relationship as something (some things?) you do something to. She contrasts this approach with the Integral notion of co-constructing relationships.

Where 2nd Tier thinking predominates in a relationship, then con-construction – what I call *Collaboration* – should be the method of managing difference between partners. However, where 1st Tier thinking is around – particularly below GREEN in the Spiral hierarchy – then people will tend to "do" to others, to infect them (or try to!) with their memes. RED, the most obvious example, has no interest in co-construction/Collaboration. It wants simply to dominate the other(s)!

However, someone whose thinking is led by RED is unlikely to get very far with reading *Knowing Me, Knowing You*! Readers are much more likely to be led by GREEN-plus in their thinking and, therefore, more likely to favour co-creation/Collaboration in their own approach to relationships. Nevertheless, they need to identify, appreciate and have strategies for dealing with people whose approaches to relationships may be very different to their own. I believe *Knowing Me, Knowing You* provides substantial assistance with this.

Because it is written ostensibly as a self-help book for anybody and everybody with reasonable intelligence, *Knowing Me, Knowing You* does not speak as clearly or directly as it could to its natural readership of GREEN-plus thinking. This again is a result of the dichotomy in its aims and a source of the confusion Sara finds in parts of it.

In conclusion…
